of reflector will often be found of use where it is unnecessary to run a whole strip reflector up the side of a window.

It is impossible to give any fixed rules as to the total number and size of lamps required for a window of any particular size, so much depends on the method of lighting employed, and the class of goods to be displayed. Although a brightly lighted window is one of the best sources of attraction as an advertisement, mere quantity of light is of no value unless the illumination is properly directed.

The field for arc lamps for pure window lighting is not quite so extensive, although there are cases where they may be preferred.

Although the most efficient source of illumination, the flame arc lamps so familiar in the streets are not suitable for interior window lighting. This is due partly to the slightly irritating fumes given off, partly to the yellow colour of the light, which makes it bad for colour-matching, and partly to the fact that flame lamps must be hung high, on account of the brightness of their globes. For very large general stores, however, with good ventilation the flame lamp is sometimes employed, but the favourite arc lamp for interior lighting is the enclosed lamp, which can be made almost perfect with regard to colour values by the use of a specially tinted glass to absorb some of the blue rays. The original open arc is approximately colour-true, but requires more frequent carboning than enclosed or flame lamps. On account of the high efficiency of metal filament lamps, however, they are generally preferable for window lighting, except where a perfectly colour-true illumination is required, when the special enclosed arc lamp gives the best results.

So far we have dealt only with lighting, the sole object of which is the illumination of articles in the window; but there is also another use to which electric lamps may be put, and that is for decorative lighting for special purposes, such as Christmas displays, where rows of small white or coloured lamps are used in festoons, on Christmas trees, or to outline some prominent feature in the window. Only lamps of very small size should be used, in accordance with the principles mentioned above, as if the eye is dazzled attention is apt to be drawn away from objects illuminated in the ordinary manner. Among the various forms of "strip" made for the purpose may be mentioned the following:—

The General Electric Co. supply a lighting strip for interior and outside decorative lighting, known as "Pixielite" strip. This comprises ordinary lamp-holders, mounted at intervals along a substantial twin cable. We understand that after exhaustive experiments, this company has succeeded in producing a fire-proof composition for moulding the holders.

The Imperial Lighting Co., the manufacturers of the well-known "Fairyland" strip, have introduced a new design which is particularly suitable for the decorative lighting of shop-windows. A miniature lamp is employed, and the screw socket holders are attached at any desired intervals, as shown in Fig. 7. As this fitting is entirely watertight, the strip can be utilised for outside decoration also. The lamps are grouped partly in series and partly in parallel, and can be wired for any supply pressure. "Fairyland" strip with bayonet caps of aluminium to take ordinary lamps is now obtainable as well as the original screw-socket and ordinary B.C. patterns.

An attractive decorative strip, comprising a floral festoon of paper flowers with miniature lamps at intervals, is supplied by the Franco-British Electrical Co., Ltd., who also have some novelties in the way of prismatic or pearl glass fittings and festoons in which the miniature lamps are connected without lamp-holders, according to a patented system.

We are indebted to the following firms for blocks used for the illustration of this article:—The General Electric Co. (67 Queen Victoria Street, E.C.), Messrs. Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster, S.W.), Messrs. Krupka & Jacoby (11 Queen Victoria Street, E.C.), the Sun Electrical Co., Ltd. (118 Charing Cross Road, W.C.), and the Imperial Lighting Co. (157 Blackfriars Road, S.E.).

SHOP FRONT LIGHTING

THE object of lamps outside shops is threefold—to illuminate the objects in the window, to call attention to the shop, and to add to the general illumination of the pavement outside the shop. We wish to urge that the first is the most important. A brightly lighted window in itself attracts passers-by, and by reflected light assists in the general illumina-

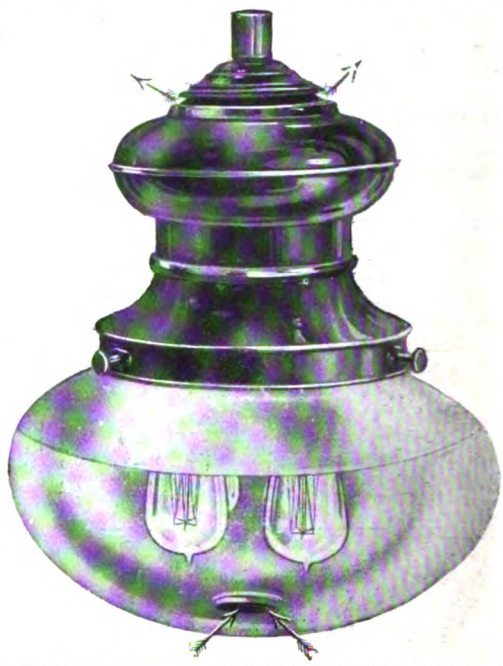

Fig. 1.—Outside Lantern showing Method of Ventilation.

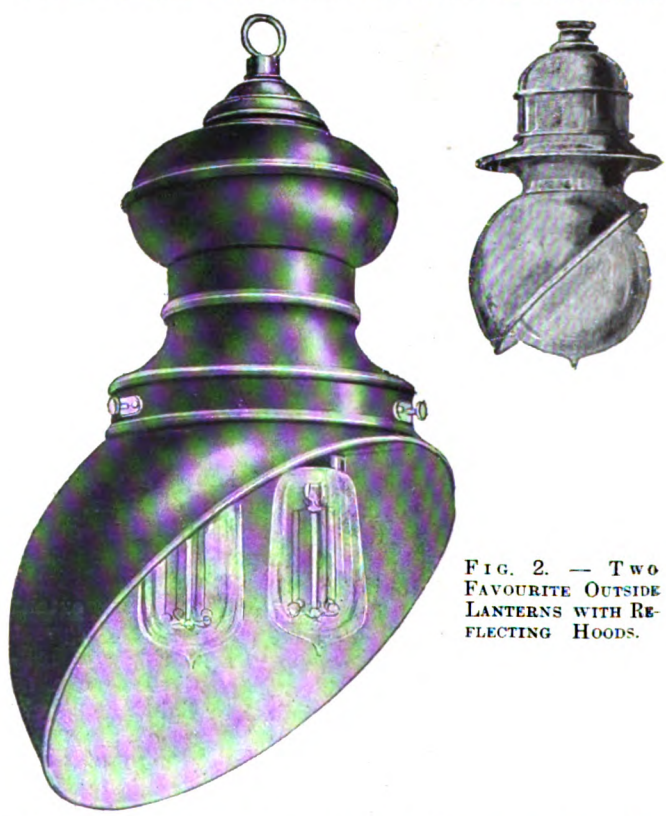

Fig. 2. — Two Favourite Outside Lanterns with Reflecting Hoods.

Digitized by Google

tion. The use of a row of unshaded arc lamps of thousands of candle-power close together certainly attracts attention, but is productive of more annoyance to the general public than it attracts admiration of intending customers. As we shall see, many lanterns are obtainable which shield the light from the eyes of the passer-by while throwing it on the goods in the window and on the pavement.

Of lanterns suitable for use with metal filament lamps of the larger sizes, and these can now be obtained even up to 1,000 c.p., we illustrate a number of simpler typical patterns in the accompanying figures; numerous more ornamental lanterns are also made. In Fig. 1, the arrows show one method of providing ventilation. The main points to be observed in the selection of these are adequate ventilation of the fitting, to prevent it becoming unduly heated by the powerful lamps employed, ease of removal of the shade or globe, and especially where vibration is at all likely to be present there should be some arrangement of springs between the lampholders and body of the lantern. A

Fig. 3.—Cast-iron Lantern for Exterior Shop Lighting.

lantern fitted with an excellent clip for easy removal of the globe, combined with a spring supporting arrangement, was described in our last issue in connection with the Hampstead Exhibition. Fig. 2 shows some patterns of lanterns with hoods over the lamps forming reflectors. A strong and simple cast-iron fitting is represented by Fig. 3, and a box-type reflector lantern is seen in Fig. 4.

It is important that due attention be paid to the protection of the wiring of these exterior lanterns. The leads should be enclosed in iron pipe down to the lantern, and special care should be taken at the leading in point at the top that the wires are not exposed. A neat connecting box supplied by the General Electric Co. for this purpose is illustrated in Fig. 5.

A good deal of outside shop lighting is done by arc lamps.

For lighting large shop-windows exclusively from the outside, the flame arc lamp is at once the most economical and the most suitable source of illumination, except where a colour-true light is required. In the latter case, enclosed arc lamps with special tinted globes, or the ordinary open arcs, should be used. Flame lamps can be obtained in various sizes, consuming from 300 to 600 watts each, and giving a light equivalent to groups of metal filament lamps aggregating from 1,500 to 3,500 candle-power respectively, but consuming only one-seventh of the current such groups would take. They must be run two in series on 100—130-volt circuits, and four in series on 200—250-volt circuits. The number of hours for which they will run before needing fresh carbons varies from 8 to 30, according to the length of the body of the lamp, the larger lamps taking longer carbons. Lamps with two or more pairs of carbons can be obtained, giving longer burning hours, if desired. Enclosed lamps can be run singly on 100-volt circuits, and two in series on 200—250-volt circuits. These lamps are not much more economical than an equivalent group

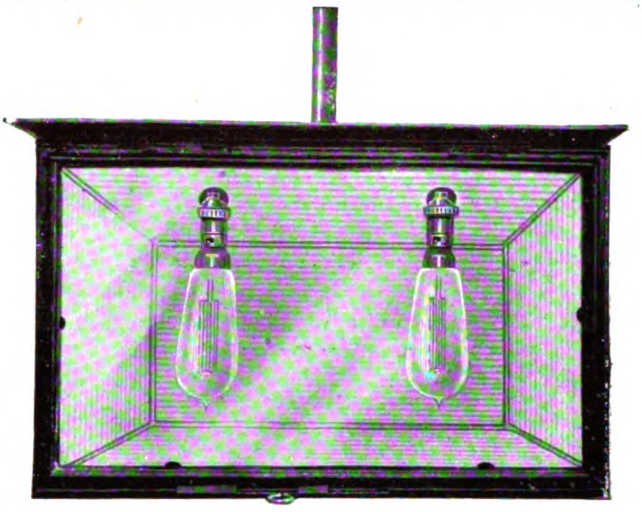

Fig. 4.—Box-type Reflector Lantern.

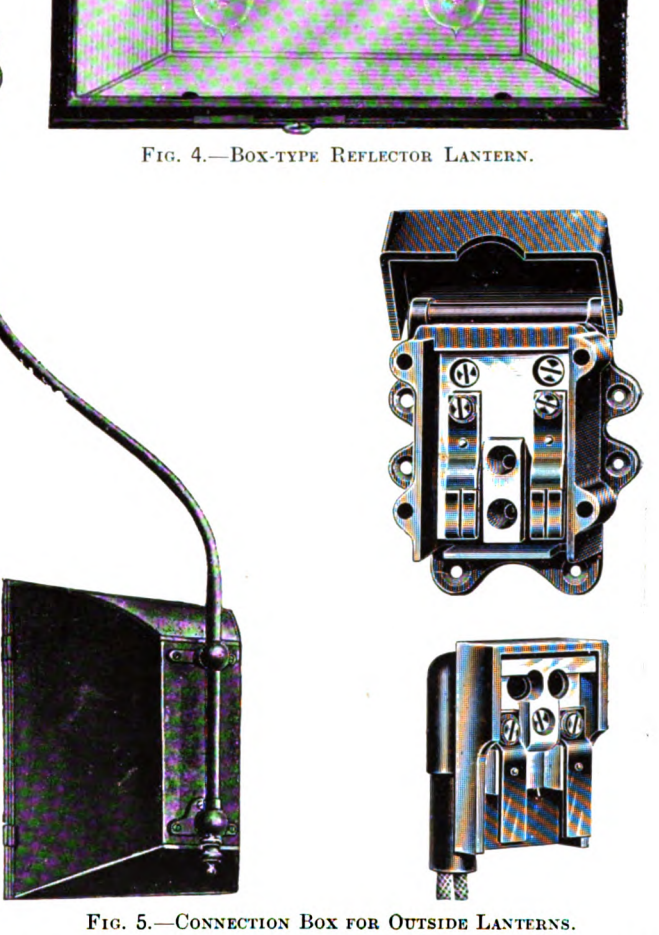

Fig. 5.—Connection Box for Outside Lanterns.

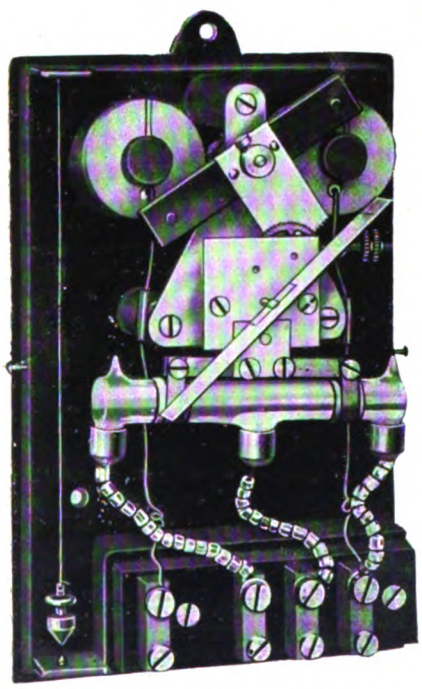
of metal filament lamps, consuming, as they do, about three-quarters the amount of current, while they need recarboning at periods varying from 50 to 200 burning hours, according to the size of the lamp. They give a light of a truer colour-value, however, than metal-filament lamps. Open arc lamps are rarely suitable as they have to be run several in series, and require frequent recarboning.

Whereas the costs of running metal-filament lamps consist simply of the cost of the current consumed and the charge for lamp renewals, both of which are easily estimated, in the case of arc lamps there are the costs of recarboning and cleaning. The cost of the carbons varies within wide limits (from 0·2d. to 2d. per lamp-hour), according to the quality and pattern of carbons employed. Thus, for a flame lamp of some 2,000

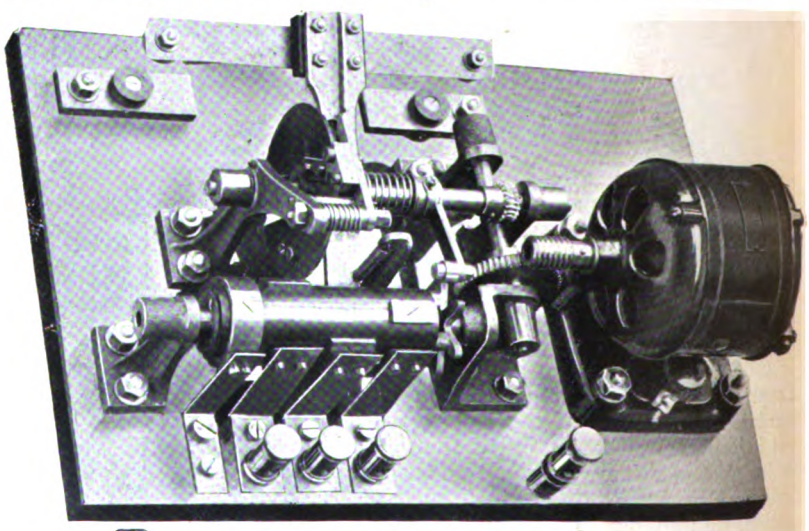
Digitized by Google

mean hemispherical candle-power, employing metal-cored carbons, the carbon cost will amount to about 1d. per lamp-hour, while by employing cheaper carbons and running the risk of having a rather unsteady light, the cost may be reduced almost down to one farthing per lamp-hour. The cost of current consumed per lamp is easier to estimate. Thus a usual size of flame arc is known as a 6-ampere lamp, and gives a mean hemispherical candle-power of about 1,500. These must be run two in series on a 100-volt circuit, and the cost of current at 4d. per unit will amount to 10s. per 100 lamp-hours for each of the two lamps. For a 10-ampere lamp, which would be the largest size suitable for shop-lighting, the cost of current only would amount to 16s. 8d. per 100 lamp-hours for each lamp. For 200 or 250-volt circuits it would be necessary to run four lamps in series. Enclosed lamps working singly on 100-volt circuits take from 300 to 800 watts, give a mean horizontal candle-power of from 350 to 1,000, according to the current taken, and cost from 10s. to 27s. per 100 lamp-hours. When working in series, the cost is about the same per lamp.



We are indebted to the following firms for kindly lending us the blocks with which this article is illustrated:—The Wardle Engineering Co., Ltd. (196 Deansgate, Manchester), the General Electric Co., Ltd. (67 Queen Victoria Street), the Cable Accessories Co. (Britannia Street Works, Tivedale, Tipton, Staffs), and Messrs. Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.).

ELECTRIC SIGNS



ONE of the foremost manufacturers of electric signs is the Sun Electrical Co., Ltd. (118 Charing Cross Road, London, W.C.). An artistic pattern for shop windows, serving the double purpose of advertising a name and illuminating the goods displayed in the window, is illustrated below. This consists of a hammered *repoussé* panel in which the letters are cut as shown. The whole is backed with satined opalescent glass and a "Sunlite" reflector fitting

"Sun" Interior Window Sign.

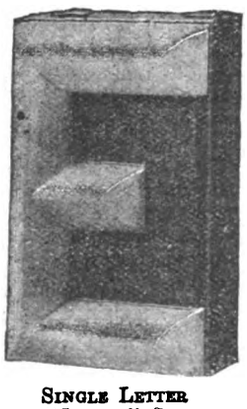
is attached to the back. Box signs can be fitted with the new "Mirrorgraph" front, which appears as an ordinary mirror when the light is off, the lettering or design only showing through when the lamp is switched on. Among the patterns supplied by this firm for outdoor use are the well-known opal-glass moulded letter signs. These letters show to better advantage than the ground-glass letters in daylight. Lamps of three colours placed inside and connected to thermal flashing devices produce a very attractive sign, as the colours appear, blend, and disappear in an irregular manner, giving the effect of a changing opal. For the large continuously changing signs for which it is required that the changes should occur in a defined succession with regular intervals, the firm supplies an automatic magnetic switch with mercury contacts. The switch illustrated is a two-way device, such as would be used for lighting a sign with two colours alternately. It comprises a two-pole electromagnet in shunt with the main circuit, and an armature attached to a tube with three contacts, and a globule of mercury. The tube is filled with an inert gas to prevent oxidation or arcing. The armature (which is rocked against the tension of a spring) works a train of wheels attached to an air-vane, and the time elapsing between each movement can be regulated from ½ to 6 seconds by varying the length of the vane. The time is thus independent of the current. Motor-driven switches for writing and colour-changing signs for currents up to 25 amperes per way are manufactured by this firm. These consist of lever switches with carbon contacts and worked by cams. The kaleidoscopic sign of this company gives a continuous change of colouring at indefinite intervals all over the front of the sign. Another useful device for window advertisement is a small collapsible sign, which can be packed away flat when not in use.

A number of different patterns of automatic switches for continuously changing switches have been devised. Among the latest of these are the two which we illustrate, supplied by the General Electric Co., Ltd. (67 Queen Victoria Street, London, E.C.). The first of these is for a writing sign, in which the individual lamps are switched in one by one. As shown, this comprises a brass drum cut away in steps and rotated under a row of phosphor-bronze spring contacts so as to lift them in succession. No current is carried by the drum, which merely serves to lift the spring contact strips up against a row of fixed contacts. For "snake crawling"

THREE-WAY SECTION LIGHTING OR COLOUR-CHANGING SIGN SWITCH.
(General Electric Co., Ltd.)



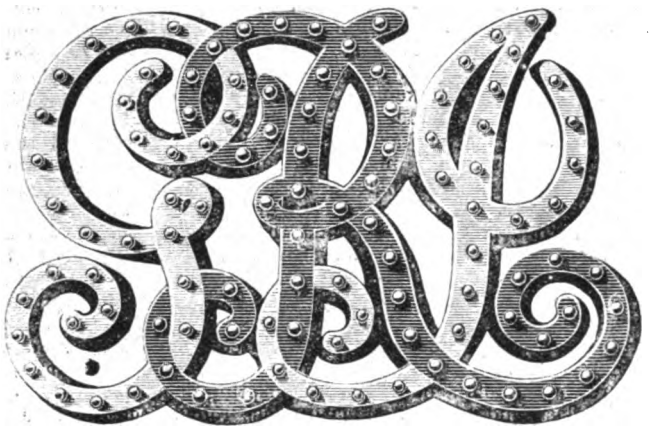
and other effects, the drum is cut spirally, so that a certain number of lamps are always on or off. The second switch illustrated is for colour-changing effects or for switching on signs in sections. It comprises from 3 to 10 knife switches which are closed successively by levers or cams. Each switch is closed against the force of a spring and is held in by a spring catch, which is released by a second cam or lever. The cams are adjustable. It may here be mentioned that the well-known "Thermo" flashers supplied by the General Electric Co. for box signs, &c., have been recently reduced in price.

A useful circular box sign which can be used separately or in the aggregate to make up a large sign for the outside of buildings is manufactured by Simplex Conduits, Ltd. (113 Charing Cross Road, London, W.C.). This comprises a conical metal reflector with a single lamp at the apex, and fronted with a circular glass plate on which is painted lettering or a design. For fixing a number of these signs (each representing one letter) in a row to the outside of a building, a system of tubular steel framework has been standardised, which is easily screwed together and erected. In an attractive modification of the Simplex box sign, the circular glass plate is of ground glass and is fixed at the side of a vertical cylinder. A lamp is mounted in the centre of the cylinder, and a cylindrical wire cage is rotated round the lamp at a slow speed by means of a small electric motor. Over the surface of the cage is fixed a patchwork cover of many-coloured gelatine paper, and the light is thrown on to the glass through this. A very pretty effect is obtained, the colours continuously changing all over the glass and blending in a most striking manner.

A useful flashing sign for shop windows illustrated herewith is made by the Electrical & Engineering Supplies Co., Ltd. (36 Upper Thames Street, London, E.C.). It consists of a solid oak frame, fixed to a sheet-metal box, containing a flasher and a 16-c.p. lamp. Transparencies comprising lettering cut out in tough black paper pasted over with strips of thin white or coloured paper and placed between two sheets of glass, are inserted in the frame. Different notices and advertisements are kept in stock, and thus the wording of the sign can be frequently changed. The whole can be hung or stood in any suitable position indoors. In the heavier signs of this firm's make for outdoor use the box is of sheet-steel, with an angle-iron framework to give the necessary rigidity. The front consists of two pieces of plate glass; the outside piece is clear, and the inside is painted on the surface facing the clear-glass front. In order to render the lettering sharply defined and durable, the glass is recessed round the letters by sand-blast, and the recessed parts are then painted, and the colouring burnt in. Alternatively, the letters may be recessed and painted, the background remaining white. In another interesting mode of manufacture, a compound plate glass, consisting of a sheet of natural red glass and a sheet of clear glass rolled together is used. The letters are sand-blasted out to the depth of the red sheet, leaving white letters on a red background, or *vice-versa*. When burnt-in coloured lettering is employed, the background may be ground glass or opal glass. The former gives a more brilliant effect when illuminated, but the latter looks better in daylight. Quite a different type of sign is that in which silvered or gilt letters are fixed radially on a circular black wood background, and are illuminated by a lamp at the centre shielded from the view of the observer. These are economical, but not so neat as the box signs.

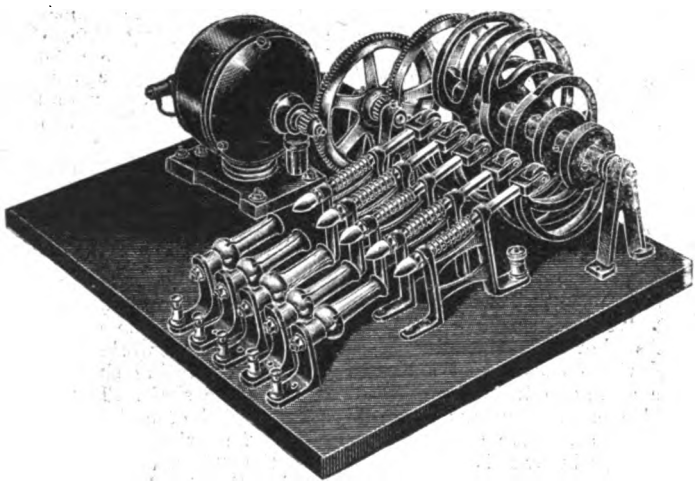
A number of the "Venner" signs, manufactured by Venner & Co. (6 Old Queen Street, Westminster, London), are to be seen about London. In these signs, the letters are outlined in small glass spheres set in the perforated cover of a metal box, in which one or more electric lamps are placed. Owing to the reflection inside the glass beads, a very brilliant effect is obtained with only one or two lamps in the box for each letter, and the effect is equally good when viewed from a fairly sharp angle. The Wardle Engineering Co. employ these signs in a modification of the reflector lanterns shown in Fig. 2 on p. 660, described in our article on the Manchester Exhibition on p. 667. An extremely good effect is produced by using three lamps for each letter, coloured red, green, and blue. For writing and colour-changing signs, Messrs. Venner supply an ingenious form of motor-driven switch. The slowly-rotating contact drum is combined with an intermediate quick-acting carbon-break switch, which comes into action immediately before the drum contacts operate, thus preventing sparking and reducing the wear at the contacts. As shown in the illustration, the switch is worked by a device consisting of a slotted disc on a rotating shaft, and a spring-controlled cam loose on the same shaft. This cam also provides means for varying the period of extinction.

An attractive style of sign suitable for fixing outside over shop windows is that known as the "Luxol" sign, and supplied by Krupka & Jacoby (11 Queen Victoria Street, London, E.C.). As shown in the example illustrated, this sign consists of one or more moulded glass letters, which are mounted in the front of a sheet-metal box. As the rounded face of each letter projects out of the surface of the box front, the sign can be read at a much greater angle than in the ordinary flush signs. The letters are of ground glass, which gives a most brilliant effect with a very small amount of light, as the whole surface of the glass is illuminated by internal reflection. If opal glass is used, a better effect is obtained by daylight, but the night effect is not so good. The "Luxol" signs are claimed to be most economical, as a single 5-c.p. lamp will illuminate thoroughly a 6-in. letter, or two 5-c.p. lamps a 12-in. letter. The depth of the letter and box does not exceed 5 in. Messrs. Krupka & Jacoby



SINGLE LETTER OF "LUXOL" SIGN MOUNTED SEPARATELY.

Digitized by Google



have recently introduced a compact flashing box sign for inside display or window advertising. It measures 5¾ by 19½ by 4½ in.

The neat and brilliant signs now much in evidence in the London streets, and comprising block or script letters of wood, painted white and studded with miniature lamps, are known in the trade as "Franco" signs. These are supplied

"Franco" Miniature Lamp Sign.

by the Franco-British Electrical Co., Ltd. (50 Oxford Street, London, W.), and also by the Imperial Lighting Co. (157 Blackfriars Road, London, S.E.). The letters are cut out in well-seasoned oak. Holes are bored, spaced from 2 to 3 in. centres, and the patent miniature lamp-holders for the screw-socket 1-c.p. 14-volt lamps are inserted in these, and connected up by rubber-covered twin cable, laid in a groove at the back. An insulating composition is run into this groove after the connections are completed, and each lamp is provided with a milled collar, which makes a water-tight joint with the socket. In this manner the whole sign is rendered thoroughly water-tight. The lamps are not con-

Plunger Contact Flashing Switch for Changing Signs.

nected in simple series, but are grouped in such a manner that if one lamp fails, the others are not extinguished. It is advisable, however, to replace a burnt-out lamp as soon as possible. Although the lamps employed have carbon filaments, the light is most efficiently utilised, and a brilliant effect is obtained for a small consumption. The coloured Coronation sign illustrated contains 105 lamps, takes about 350 watts, and thus costs 0·35d. per hour for current with a charge of 1d. per unit. Further, modifications of the "Franco" signs are made in which the lamps are arranged in trough-shaped letters of sheet-metal to confine the light to the surface of the letters. The changing signs are operated by means of a motor-driven switch. Phosphor-bronze spring contacts carrying current to the various groups of lamps are arranged in a row on a fixed bar, and a metal drum, cut away in steps so as to complete the various circuits in succession, is rotated under them. The switches consume about 60 watts, or a little over one-twentieth of a unit per hour. In the heavy pattern illustrated, solid plunger contacts are forced by cams against springs into split-tube sockets, from which a quick break is obtained when the cams release them. Such contacts will take up to 20 amperes per way, and the usual sizes have seven or eight ways.

The Electric Sign & General Advertising Co., Ltd. (36 Cowoross Street, London, E.C.), the pioneers of the electric sign industry in this country, are the makers of the famous "Bovril" signs and others of a similar nature. One design of letter sign consists of wood or metal grooved letters, with miniature lamps, spaced at short intervals in the grooves. The lamps are of three different colours, are interspersed, and those of the same colour are switched on together. By using a special rotary switch the colours can be mixed and varied in any desired manner. This switch consists of a fibre disc, slowly rotated by a worm-geared motor inside a ring. The disc has metal contacts on its periphery, and the separate lamp contacts, comprising springy strips of phosphor-bronze, are spaced round the inner periphery of the ring. A new box sign has a thermal flasher worked in combination with relays, so that separate portions of the front are illuminated in an ordered succession, as in the case of motor-driven signs. This sign requires no adjustment, and only requires to be connected up to the supply circuit.

Before concluding these notes on electric signs, it will be as well to warn our readers as to the difficulties which may be encountered by those desiring to erect large advertising signs outside their premises. A formidable obstacle is the Sky Sign Act of 1894 and 1904, which will not allow any advertisement to be erected on, or above, any building or structure if any part of it will be visible against the sky from any street. If placed on a board, however, it is permitted to extend 3 ft. above the cornice or wall on which it is fixed. Further, the London County Council have taken proceedings against the erection of several signs under the 1894 Building Act, on the ground that they were projections in front of the building line; in most cases, however, they have lost the actions. The by-laws of the L.C.C., administered by the police, have also to be considered, as these prohibit signs which "change *suddenly* in colour, intensity, or direction to the danger of the public." For this reason, the larger signs are switched off and on in sections or change from white to a dull colour before being switched off. The Advertisement Regulation Act of 1907 gives local authorities power to make by-laws to restrict or prohibit advertisements in public parks, pleasure promenades, and similar open spaces. After the five years' grace allowed by this Act, it may be that the signs seen from the Embankment, Trafalgar Square, and the parks, &c., will have to be taken down. Further obstacles at present are clauses in the leases of buildings, either forbidding advertisements of firms other than those renting the premises, as in the case of Crown property, or requiring special permission and payment of a rent. In some cases the fixing of the framework of signs to the main structure of the building is forbidden; but the clause can be often evaded by suspending the sign from the roof.

THE COST OF LIGHTING BY METAL FILAMENT LAMPS

A GREAT cheapening of the cost of electric lighting was made by the introduction of the now widely-used metal filament lamp, so that electric lighting is not only the cleanest, safest, healthiest, and most effective method of illumination, but it is actually the most economical. For shop-lighting purposes, where fairly large units of light are the rule, it has even more completely superseded the older carbon lamp than in the case of house lighting. In its larger sizes, too, it can compete with small arc lamps as regards economy, although when we come to really large units for exterior lighting there is no doubt that the flame arc lamp still holds the field.

In order to enable intending consumers to obtain readily an idea of the cost of lighting with these lamps, we have prepared two tables, showing at a glance the approximate cost of the electricity consumed by each lamp in 100 hours for all the various sizes at different prices of supply. The figures in brackets refer to the voltage of the supply. The first table gives this for Osram lamps. In these lamps the filament is made of the metal tungsten, which is now employed in the majority of metal filament lamps (*e.g.*, the Mazda, "Z," Simplex, Leuconium, Brimsdown, "Onewatt."

1000 watts *	900	25 0	29 2	33 4	37 6	41 8	45 10	50 0	54 2	58 4

* These lamps are made both for 100-135 and 200-260 volts with the same candle powers.

&c.) With the exception of the last-mentioned, which is only made in the larger sizes, these tungsten lamps are all made in sizes approximating to those in Table I., and their consumptions are about the same.

Table II. relates to tantalum lamps. These, it will be seen, are not quite so economical in current consumption as the tungsten lamps, but the cost of the lamps themselves is less, and the lamp will also stand rougher usage as the filament, which is of wire-drawn tantalum, is tougher. Tantalum lamps are rated by the makers in candle-power, and not in watts. The ratings are, however, in the German "Hefner" units, so we have added the values in British candle-power to render the two tables comparable.

Table II.—Approximate Cost of Electricity Consumed by Tantalum Lamps per 100 Hours.

Trade Designation of Lamp.	British Candle-power.	Price per Unit of Supply. 3d.	3½d.	4d.	4½d.	5d.	5½d.	6d.	6½d.	7d.

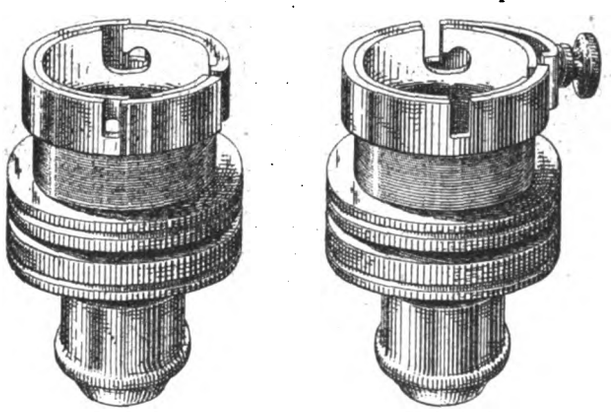
32 c.-p. 200–250 volts	28 8	1 9½	2 0½	2 4½	2 7½	2 11½	3 2½	3 6½	3 9½	4 1½
50 c.-p. 100–130, 140–160 and 20 –250 volts	45	2 1½	2 5½	2 10	3 2½	3 6½	3 10½	4 3	4 7½	4 11½

* These lamps are suited to continuous-current circuits only; all the other sizes can be used either on alternating- or continuous-current circuits.



We have not thought it necessary in these tables to include lamps for voltages below 100 volts. Lamps of 25, 50, and other low voltages are sometimes used in connection with small transformers to reduce the pressure, where small units of light are desirable. The total cost of the light obtained will be slightly more than that given in the above tables, owing to the loss of energy in the transformer, but will still be very much below that of lighting by carbon filament lamps. By far the larger amount of incandescent shop lighting is carried out by means of metal filament lamps direct on the ordinary supply circuits.

THE TELEWRITER AS AN ADVERTISER IN SHOP-WINDOWS

MOST of our readers will be acquainted with the telewriter, the ingenious apparatus that actually writes out in the handwriting of the sender many miles away messages which would ordinarily be telephoned and transmitted verbally with doubtful accuracy. The mechanism and working of the instrument was fully described in ELECTRICAL ENGINEERING, July 7th, 1910, p. 447. The telewriter has been in use for some years by a number of important business houses for inter-departmental communication, and an exchange in London enables subscribers to communicate with each other in writing or to transmit telegrams direct to the Post Office or the offices of cable companies. One of the latest applications, however, is the use of a single transmitter and receiver, connected by a short length of wire, as an advertising medium in shop windows. The receiver, which has a special enlarged writing board, is placed in the window in the view of the public, and the transmitter is worked at any convenient point in the shop or adjacent office. The arm of the instrument is caused to write out items of the day's news interspersed with advertising matter relating to special articles on sale, &c. The operator is concealed, but may have a view of the window, and may cause the instrument to write personal remarks about, or make sketches of, people in the crowd watching, to their astonishment and the amusement of the others. A complete set, comprising transmitter and receiver, can be hired from the National Telewriter Co., Ltd. (20 Bucklersbury, London, E.C.), for a small fee weekly. The terminals of the apparatus are connected by means of an adapter to a lamp-holder, and only a small amount of current is taken. Where no electrical supply is available, accumulators can be used.

NEW LOCKING LAMP-HOLDER

A NEW device, which can be easily attached to existing lamp-holders for securely locking them, and thus preventing the removal of the lamps except by authorised persons, has been introduced by the General Electric Co., Ltd. (67 Queen Victoria Street, London, E.C.). As shown in the sketch, it consists simply of a split steel ring with a small screw key. The liner of the holder has to be slotted about ⅜ in. down, in order to apply the device, but this can be readily done by the user, or, if desired, the General Electric Co. will supply separate liners ready slotted. The action of the device is evident from the sketch. The lamp is inserted

Locked. Unlocked.

G.E.C. LOCKING LAMP-HOLDER.

in the usual manner, and the catch at one end of the ring slips into the slot as the lamp is turned. To take out the lamp, a screw "key" is inserted and screwed in until the catch is lifted above the liner, and the lamp is then turned and removed in the usual way. On taking out the key, the holder is ready for the insertion of another lamp, which it locks in automatically as before. We understand that the addition of this device to the standard lamp-holder increases the price by 2s. 3d. per dozen. Keys are supplied at 6d. per dozen. The rings, which will be supplied separately if desired, are plated with brass to prevent corrosion, and to make them uniform with the holder.

Electric Smelting.—It is stated that an application is being made to the Norwegian Government for a concession for electric smelting on the Tromsö Iron Fields. If the concession is obtained it is intended to begin work in the spring.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published October 13th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

21,357/09. **A.-C. Motor-starter.** A. C. Heap. In order to obtain a gradual increase of the applied pressure when starting A.-C. motors, the starter consists of a one-to-one ratio transformer with the primary and secondary windings arranged so that their inductive relations can be continuously changed from zero to a maximum. Automatic gear is provided to prevent too sudden an increase in the applied pressure, and to cut out the transformer directly the full voltage has been applied. Fourteen figures.

1,146/10. **Motor Control.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). In the system employing "notching relays" to regulate the successive closing of the contactors, the relay series coils are arranged to serve as overload relays to open some or all of the contactors on an overload, thus protecting the motor by reducing the voltage applied. For this purpose, contacts on the "notching relays" are connected with respect to the corresponding contactors so that the circuits of the latter are opened when the relays operate on an overload. Three figures.

1,459–60/10. **Liquid Sterilisers.** H. B. Hartman (Pittsburg, U.S.A.). These specifications describe electrolytic apparatus for purifying water and other liquids by subjecting them to the action of a current flowing between aluminium electrodes, the gases and salts generated acting on the organic impurities. The circuit is automatically made with the starting of the flow of the liquid, but is not broken until shortly after the flow stops, so as to ensure a complete treatment. The liquid undergoes several successive treatments, and is mixed with the generated gases for a short time between each. Eight figures.

14,125/10. **Turbo-alternator Rotors.** Allgemeine Elektricitäts Ges. In order to assist the cooling of the rotor windings of turbo-alternators, the parts of the rotor body in the neutral zones between the poles and at the pole edges, *i.e.*, those portions not required for the field flux, are omitted. Other parts of the rotor not necessary for the support of the end windings projecting over the effective part of the rotor are also omitted, and a flow of cool air through these portions of the body is induced. Six figures.

14,961/10. **Coil Insulation.** M. Meirowsky (Cologne). This specification describes an apparatus for producing a close stratified insulating casing round former-wound armature coils. The side of the coil is partly enveloped by an endless band which passes over hot rollers at its contacts with the coil. As the coil is rotated, the mica sheets are fed in between the band and the coil, and are compressed on to the latter by the rollers. Two figures.

15,417/10. **A.-C. Solenoids for Automatic Controllers.** G. A Kohler (Chicago, U.S.A.). A.-C. solenoids with cores to move over a considerable distance and with sufficient force to work a contact device, consist of a stationary solenoid with separate coils for the different phases, and a core of laminated iron. The latter is provided with a short-circuited winding or simply a metal sheath and a return path for the magnetic flux outside the solenoid comprising two strips of laminated iron one on either side. Five figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.
Names in italics indicate communicators of inventions from abroad.
Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Lauterbach [Vapour lamps] 1,113/10; Heimann and Schäffer [Working arc lamps in series with incandescent lamps] 11,582/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Steynis [Insulating devices] 2,899/10; Von Pinterschofen [Insulating tubes] 14,459/10.

Dynamos, Motors and Transformers: Leitner [Train-lighting] 22,611/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Marine propulsion] 26,346/09.

Electric Ignition: Phillips, 29,947/09; Etablissements de Dion-Bouton (Soc. Anon.) [Distributors] 10,780/10.

Electrometallurgy and Electrochemistry: Cowper-Coles [Electroplating] 22,374/09.

Incandescent Lamps: Kuzel and Wedekind [Production of zirconium] 23,215/09.

Instruments and Meters: Cooper [Speed alarms] 21,490/09.

Storage Batteries: Pescatore and Tudor Accumulator Co. [Ventilation of cells] 4,567/10.

Switchgear, Fuses, and Fittings: Patterson [Safety-lamp for mines] 19,359/09; Feld Bros. & Co. and Sobotka [Connectors] 20,035/09; Bousfield [Standard resistances] 27,335/09; Olmsted [Control apparatus] 4,696/10; McKenzie & Holland, Ltd. and Wood [Switches] 11,281/10; Freiberg [Lamp-holders] 12,609/10.

Telephony and Telegraphy: Webb [Telephones] 22,580/09; Burns [Wireless transmitter] 22,640/09; Chisholm [Telephone system] 8,332/10.

Traction: Patterson [Automatic signalling system] 14,925/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Current-collectors] 24,016/09; Siemens & Halske A.-G. [Traffic protecting device] 18,670/10.

Miscellaneous: Day and Allen [Advertising signs] 21,782/09; Heitman [Electromedical apparatus] 22,072/09; Headland [Fire-alarms] 22,617/09; Scherl [Gyroscopic apparatus] 27,687/09; Brennan [Gyroscopic apparatus] 30,417/09; James (*Compagnie Générale de Phonographes et Cinematographs*) [Machine for manufacturing films] 2,998/10; Stevenson [Boxes for metal filament lamps] 3,900/10; Tas [Signs] 6,361/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: Sagaer [Magnetos] 20,306/10.
Incandescent Lamps: Carangelo, 21,740/10.
Instruments: Spalazzi [Transmitting angular movements to a distance] 2,633/10.
Miscellaneous: Presser [Electric welding] 14,859/10; Hanss [Tidal hydraulic power plants] 21,221/10.

Opposition to Grant of Patent

27,380/09. **Recording Instruments.** H. Hammarlund (Svängsta, Sweden). Opposition has been entered to the grant of this patent, which describes a mechanism for producing a lateral as well as a longitudinal movement of the inking band of recording instruments, so that the marking styles may come into contact with different parts of its surface.

Application for Amendment

24,643/08. **Storage Battery Plant.** A. M. Taylor desires to amend this specification, which covers special designs of boosters and methods of controlling them. Each booster set has two separate armature windings on the same or separate cores, and is controlled by a series-parallel grouping switch and an automatic switch which short-circuits the booster fields. This arrangement provides for an increased range of voltage, and the automatic switch protects the boosters against excessive rushes of current. The use of a "bucking" booster in conjunction with an extra set of cells is also covered by this patent. The proposed amendments are detailed in the Official Journal of the Patent Office of October 12th, 1910, p. 1703.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

23,765 of October 26th, 1896. **Miners' Lamps.** W. Ackroyd and W. Best. This patent covers a magnetic unlocking arrangement, and also an igniting electrode which can be turned out of the flame after the wick has been ignited.

23,872 of October 27th, 1896. **Coal Cutters.** F. W. Hurd. Mechanism for electrically-driven coal-cutting machines with rotary and reciprocating cutter bars is covered by this patent, which also describes gearing for machines of the disc and chain-cutter type.

23,942 of October 27th, 1896. **Circuit-breakers.** R. Belfield (*A. J. Wurts, U.S.A.*). The single claim of this patent is as follows:—"In a switch or circuit-breaker having more than one set of contacts, the provision of metallic contacts through which the current flows after the main contacts have been opened and before the circuit is finally broken through infusible contacts provided for the purpose."

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: J. Y. Johnson (*Badische Anilin und Soda Fabrik*) [Improving power-factor of A.-C. distribution systems] 14,460/04.

Dynamos, &c.: Siemens Bros. & Co. and H. Berry [Ventilation of commutators] 13,589/05.

Instruments, &c.: J. M. Tourtel [Prepayment meters] 13,430/05.

Switchgear, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Overload protective devices for compounded self-exciting alternators] 13,379/05.

Telephony, &c.: S. G. Brown [Wireless telegraphy] 14,190/05; C. J. and F. X. Belin [Phototelegraphy] 13,470/05.

Traction: E. Rothwell [Stud-switches for surface-contact system] 14,792/04.

Miscellaneous: Edison Ore-milling Syndicate (*T. A. Edison, U.S.A.*) [Magnetic separators] 14,295/03.

Digitized by Google

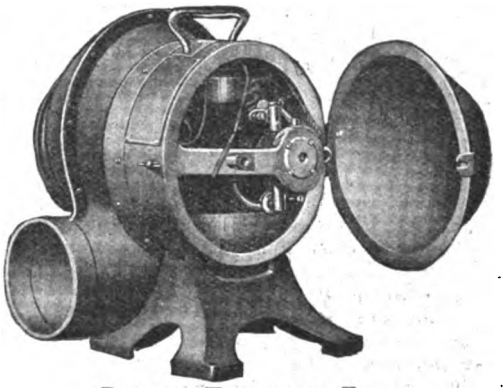
ENGINEERING AND MACHINERY EXHIBITION IN MANCHESTER

AN engineering and machinery exhibition, organised by the *Engineering Review*, is being held at the City Exhibition Hall (Liverpool Street, Deansgate, Manchester); it was opened last Friday, and will remain open until November 5th. Although nothing of a strikingly novel character is shown to distinguish the exhibition from others of a similar nature, yet there is much to interest Manchester engineers, who will not find a visit to the exhibition wasted time.

The chief electrical engineering exhibit is that of Ferranti, Ltd. (78 King Street, Manchester, and Hollinwood, Lancs.), who have some good specimens of their switchgear on view. Their larger switchgear is represented by an example of their three-panel ironclad high-pressure switchboard, suitable, for instance, for a large manufacturing works supplied at high pressure, but we were particularly struck with the attention given to the smaller classes of switchgear, of which admirable examples were shown. Among these were motor starters of all sizes, and with the high finish and workmanship characteristic of all Messrs. Ferranti's manufactures, and a new pattern of small ironclad circuit-breaker to conform with the new Home Office Rules for workshops and factories, and also suitable for use as a house-service cut-out in place of fuses. Resistance "dimmers," and field regulating switches of the compressed carbon dust type, and of good solid design, are also exhibited in various sizes and shapes. In addition, samples of the firm's usual types of switchgear, instruments, and meters are on view.

The Wardle Engineering Co., Ltd. (196 Deansgate, Manchester) have a good selection of their electric lanterns prominently displayed on a stand near the door. These fittings are particularly well suited for shop front and outside shop-window lighting, and also for the illumination of workshops and other large spaces. For the former purpose, an innovation has been introduced by fixing letters on the "Venner" glass sphere principle, either in the back of the reflector or in the lower part of the hood, so that the light shines through and the lantern serves at the same time as a first-class illuminated sign. We prophesy great popularity for this pattern.

Some excellent specimens of machine tools are exhibited by various makers. Messrs. Drummond Bros., Ltd. (Churchill Works, near Guildford, Surrey) show, in addition to a collection of their usual lathes and other machine tools of a smaller size, a "Drummond-Barreto" universal screw-cutting, turning, boring, drilling, milling, and gear-cutting machine, which although primarily designed for ship-repair work, should have many other useful applications.



Among other exhibitors, we may mention Messrs. Ackroyd & Best, Ltd. (Morley, near Leeds), whose miner's lamp with electromagnetic lock and machine for safely relighting lamps underground is demonstrated; Messrs. Aiton & Co. (Derby), whose automatic exhaust valve should be inspected by visitors; and the "Auto" Recorder Co. (Leicester), who have a CO_2 recorder in operation.

A paper was read at the Exhibition on Monday by Mr. Frank Nasmith entitled, "The Electrical Engineer and the Textile Machinist." After some general remarks as to necessity for special knowledge of textile conditions on the part of electrical engineers preparing schemes for the electrical driving of spinning mills, an example was taken of the way in which electrical driving could even be made to improve the conditions as in the Brown-Boveri system of variable speed drive of ring spinning machines by the Deri motor, in which a constant tension can be kept on the yarn by varying the speed of the spindle according to the diameter of the cop under the ring. Another way in which electricity had helped the textile manufacturer was in the Carver system of replacing the cards in a Jacquard loom by designs in a metal band forming contact and non-contact surfaces under a series of contacts controlling the hooks which produce the pattern electromagnetically. A further example mentioned was the Chapman electric neutraliser for counteracting the effect of static charges on the yarn by means of high tension alternating charges produced by a small transformer.

The Municipal Wiring Bill.—Ealing is now to be added to the list of towns which have agreed to give financial support. It will be remembered that there was considerable local excitement in Dundee with regard to the proposal that the Corporation should support the Bill, and it has now been decided that the Corporation will support it with the exception of the wiring clause.

PORTABLE VENTILATING SET

A HANDY little portable ventilating set comprising a small D.C. motor, direct-coupled to a centrifugal fan, has been introduced by the Sturtevant Engineering Co., Ltd. (147 Queen Victoria Street, London, E.C.). As shown in the illustration, the fan casing is composed of two light steel stampings, and as the motor is of a specially light construction, the whole can be conveniently carried about. The blade wheel of the fan is of the Sturtevant "Multivane" pattern, and supplies a large volume of air at a fairly low velocity with small power consumption. The set can be connected to the lighting circuit, and costs to run only a few pence per day. It is supplied in three sizes with D.C. enclosed motors, wound for 220 or 110 volts. The set can be placed on a window-sill or can be fixed up permanently for blowing fresh air into a room or for exhausting the air out of the room. It should be particularly useful for smoking rooms, kitchens, laboratories, telephone boxes, lavatories, engine-rooms, boat cabins, &c., and can be employed with advantage in offices, schoolrooms, and sick rooms.

PORTABLE VENTILATING FAN.

ELECTRICITY AT THE BUSINESS EXHIBITION

A GOOD display of the ways in which electricity is of use in offices is made by Electrical Installations, Ltd. (27 Martin's Lane, Cannon Street, E.C.), at their stand at the exhibition now being held at Olympia. Electric lighting is represented by an extensive display of Osram lamps, including a demonstration of their ability to withstand vibration in the form of a little hammer worked by a trembler continually knocking against a lamp bulb. Attention should also be drawn to the collection of holophane glassware, the superiority of which in being able to make the most of the light where it is actually wanted is most effectively shown. The Laurie and Inglefield system of "travelling" pendants hanging from a little trolley on an overhead wire is shown in combination with an ingeniously constructed spring extensible flexible lead for hand lamps, where the conductors are coiled round a central covered spring, which can also be used as an earth lead. There is also a good display of "Quartz" heating apparatus (see ELECTRICAL ENGINEERING, Vol. V., p. 631), and one corner of the stand is devoted to telephone apparatus, including a new secret inter-communication system. The Ozonair system of ventilation and air purification is also demonstrated, and the application of electricity to accurate timekeeping is exemplified by the latest system of Aron electric clocks, in which two master clocks are employed which can check each other, and either of which can automatically take control of the system if the other becomes deranged.

The company have an interesting system of maintenance contracts applying to lighting as well as telephone installations, by which they take whole charge of an installation, and are responsible for all lamp and fuse renewals, &c., and keeping apparatus in good condition at very moderate rates.

Manchester Section of the Institution of Electrical Engineers.—The new session of the Manchester Section was well inaugurated last Friday by a conversazione held at the Whitworth Institute. Mr. Peck (Chairman of the Section) and Mr. Ferranti (President-Elect of the Institution) received the guests with Mrs. Peck and Mrs. Ferranti, and over 200 people were present. The majority of the prominent members from Manchester and the neighbouring towns were there, and a number of members had also come from a distance to make use of the opportunity to meet old friends. Some excellent vocal and instrumental music had been provided, and the function, which is a new departure for the Manchester Section, was a decided success.

CORRESPONDENCE

MUNICIPAL WIRING BILL.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I notice that it has been stated in your paper that amongst the Corporations who have promised moral and financial support to the above Bill are Glasgow and Barnes.

I beg to inform you that in neither of these cases has the recommendation of the Electricity Committee to support the Bill been confirmed by the Council.

I am, dear sir, yours truly,

LEONARD G. TATE.

Electrical Contractors' Association,
20 Bucklersbury, E.C.
October 15th, 1910.

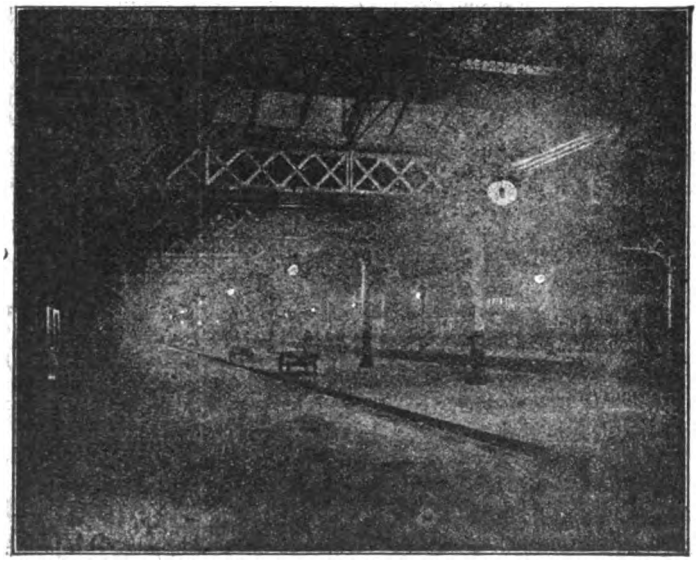
DIESEL ENGINES.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—As a user of Diesel engines, I am naturally interested in the announcement by Messrs. Willans & Robinson and also a letter from the Diesel Co. in your current issue.

I have always understood, however, that the Diesel Engine Co., have no works of their own, and do not manufacture engines, but that they merely act as an intermediary between the manufacturer and the user. Further, I believe that in some cases they recommend foreign-made, and in others British-made engines as being superior one over the other.

The Diesel plant in my charge is British-made, purchased direct from the manufacturers, and gives every satisfaction.



I believe I am correct in saying that the original Diesel patents have now expired, and it is therefore competent for any firm to enter the lists.

Yours faithfully,

ALL BRITISH.

OSRAM LAMPS FOR RAILWAY STATION LIGHTING

THE accompanying illustration, which has been sent us by the General Electric Co., 67 Queen Victoria Street, E.C., represents an installation of Osram lamps recently put up at the Mayfield Street station—the new station recently built by the London and North-Western Railway Co. to deal with Manchester local traffic. The platforms are lighted

OSRAM LAMPS AT MAYFIELD STREET STATION, MANCHESTER.

throughout by Osram lamps, and thirty-six 400 c.p. 200-volt lamps are used, arranged in fittings which have been supplied by the General Electric Co., Ltd., hung on chains from girders 15 ft. from the bottom of globe of fitting to ground, and arranged 60 ft. apart. The work has, we understand, been carried out by Messrs. Collier & Co., 29 King Street West, Manchester.

Theft.—The late traffic manager of the Lanarkshire Tramways Co., John Downes, is being charged with embezzling sums of money, amounting to £550, which had been entrusted to him by various persons for the purchase of shares in the company.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

METAL FILAMENT LAMPS.—A useful blotting slip from Messrs. Drake & Gorham, Ltd. (66 Victoria Street, S.W.), calls attention to the fact that they can give immediate delivery of Osram and tantalum lamps. Affixed to it is a most effective miniature reproduction of the firm's new large catalogue, by turning over the folding front of which are revealed the prices of the complete range of sizes of both Osram and tantalum lamps in a more convenient form than we have yet seen them arranged.

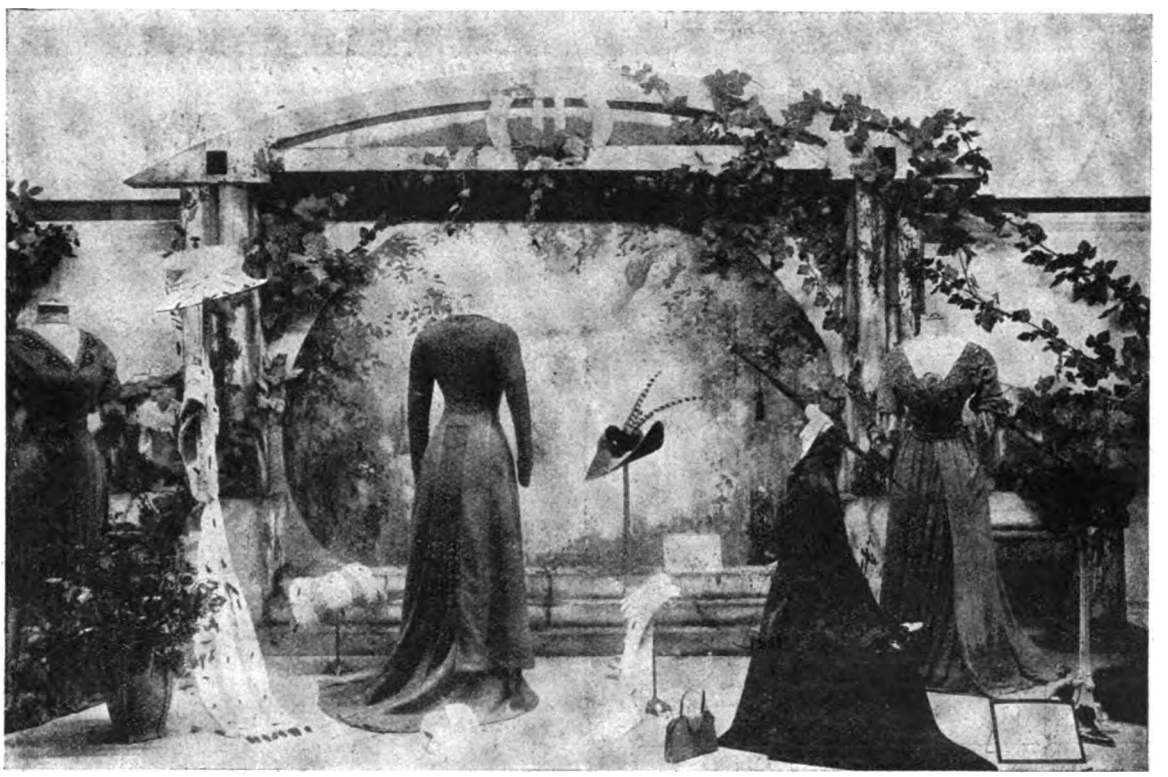
ARC LAMPS.—The Jandus Arc Lamp & Electric Co., Ltd. (Hartham Road, Holloway, London, N.), have issued a revised edition of their arc lamp catalogue. This contains full particulars of the well-known Jandus enclosed flame lamp, with which a burning life of 70 to 90 hours on one trim is obtained with low running costs. A new small pattern lamp of this type, taking from 200 to 300 watts and with the same burning hours, is described. Ordinary enclosed lamps, miniature enclosed lamps, and special colour-matching lamps are also listed, as are various accessories, including the Jandus self-replacing automatic cut-out.

CAST-IRON AND STREET LIGHTING FITTINGS.—We have received from the Cable Accessories Co., Ltd. (Britannia Street Works, Tinidale, Tipton, Staffs.), a comprehensive catalogue of cast-iron and other electric light fittings. These include a very complete range of watertight single-light pendants, brackets, &c., mill fittings, and hand lamps, as well as a great variety of ships' fittings. Particular attention should be drawn to the "Sceaco" series of cluster light fittings for metal filament lamps, one of which is illustrated in Fig. 1 of our special article on shop front lighting. In addition to these cast-iron lanterns, a few designs with spun sheet metal tops are included. The street lighting fittings for metal filament lamps comprise a number of complete lanterns, swan-neck fittings, brackets, &c., as well as conversion fittings for gas-lamp posts.

MOTOR STARTERS.—A leaflet from the Adams Manufacturing Co. (Bedford) describes a series of new types of alternating-current solenoid motor-starting switches. These include double or triple-pole solenoid switches for motors capable of being thrown directly across the line to start, as well as equipments in which relays are employed to actuate groups of solenoid switches in the motors requiring resistance or auto transformer starters.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

INSTALLATION MATERIAL.—The Electrical Company, Ltd. (122-124 Charing Cross Road), are issuing a new list of materials for electric light and power installations in a very convenient pocket form, which should be of use to contractors. The first section deals with continuous and alternating-current motors and starters of small and moderate size, electric crane equipments, lift controllers and accessories, fans, high and low-tension switches, &c., distribution boards, plugs, hand lamps, and flame and other arc lamps and accessories. Other sections are those of the meter department, including switchboard and portable instruments, meters, &c.; the cable department, with particulars of wires, cables, conduits, &c., and the lamp department illustrating applications of the Aegma and Nernst lamps and various forms of strip, chain, &c., for decorative lighting signs, &c.



PETROL LIGHTING SETS.—An illustrated booklet in German, published by the Allgemeine Elektricitäts Gesellschaft of Berlin describes the working and management of small lighting sets with direct-couped two- or four-cylinder petrol engines.

HOUSE SERVICE FUSE-BOXES.—A leaflet which has been recently issued by the Edison & Swan United Electric Light Co., Ltd., Ediswan Buildings, Queen Street, London, deals with an improved form of house service cut-out. The base is of vitreous porcelain, fixed in an asbestos-lined cast-iron case. The cover, which is also of cast-iron, asbestos lined, is provided with a small inspection window, through which the fuse may be viewed. All live metal parts are, of course, thoroughly shrouded. Insulating bushes are provided, and the case can be sealed in the usual manner. A complete range of standard cut-outs for motor and house-service work is now made in this type, with 3 in., 4 in., and 6 in. break, according to the current with which they are to work. The pattern with 3 in. break is made in 25 and 50 ampere sizes for use on non-inductive circuits up to 250 volts pressure; the 4 in. break is used for 25, 50, 100, and 250 amperes on non-inductive circuits up to 250 volts; whilst the 6 in. break is made in the 25, 50, 100, and 250 ampere sizes for use on inductive circuits up to 500 volts pressure.

IRON AND STEEL.—The Consett Iron Co., Ltd., Durham, have sent us a set of circulars describing the company's manufacture of steel plates, angles, channels, bars, &c. A description is given of the company's staiths at Derwenthaugh on the Tyne for shipping coals and coke, and a list of fire-bricks and quarls manufactured by the company is also included.

OSRAM
LAMPS

FOR SHOP WINDOW LIGHTING

REDUCE ILLUMINATION EXPENSES TO A MINIMUM.

The above Photograph, reproduced by kind permission of Messrs. Selfridge & Co., Oxford St., W., was taken at midnight, the sole lighting effects being obtained by **OSRAM LAMPS** used in conjunction with scientifically designed reflectors, providing perfect illumination and an even distribution of light.

UNRIVALLED FOR BRILLIANCY AND LONG LIFE.

Contractors should write for a supply of OSRAM Advertising Literature, printed with name and address FREE, for distribution amongst customers.

All Voltages 2 to 260. All candle-powers 1 to 1000. Average life over 2000 hours.

ELECTRICAL EXHIBITION AT OLYMPIA

We have been favoured with an advance copy of the floor plan and prospectus of the 1911 Electrical Exhibition, which will be held at Olympia (London) from September 23rd to October 21st, under the auspices of the National Electrical Manufacturers' Association. The organising managers are the International Trade Exhibitions, Ltd., Broad Street House, London, E.C. The last electrical exhibition, held at Manchester under the same auspices and management in 1908, was a great success, and coming, as this one does, at a time of a general revival of trade, it should benefit the electrical industry considerably. Arrangements are being made to create a special interest among manufacturers in every industry utilising power, and the management is making special endeavours through Government channels to bring the exhibition to the notice of likely users of electrical equipment in all parts of the world. Applications for space should be made to the organising managers as soon as possible if the best positions are desired.

THE WELLMAN AIRSHIP

The only possible means for news of the Wellman airship, during her unsuccessful attempt to cross the Atlantic, to be transmitted to shore was by wireless telegraphy, and apart from the purely aeronautical aspects of the venture it was of interest as a completely successful experiment in wireless telegraphy from dirigible balloons. We have already given some notes on the wireless equipment (see Electrical Engineering, October 6th, page 635), from which it will be remembered that the installation was designed for a maximum range of 100 miles, and utilised the equilibrator or trailing rope as an earth connection. A number of messages were sent successfully up to a certain point, but for some days these appear to have ceased as the ship was carried by unfavourable winds further than the hundred miles range of her apparatus from the "track" of the liners. There was considerable trouble with the equilibrator, and notwithstanding the serious jerking in the heavy seas which have been encountered, this could not be cast off, as this would at once remove the earth connection and reduce the range of communication to almost nothing. In face of these difficulties, however, the wireless equipment remained in working order to the end, and it is entirely due to its efficiency that the daring crew attracted the attention of a passing ship before they took to their lifeboat and were finally saved.

NATIONAL ELECTRICAL MANUFACTURERS' ASSOCIATION

The committee of this Association a short time back decided that in future in addition to the ordinary annual general meeting of the Association, half-yearly meetings should be held, and that these should preferably be held in towns other than London, where the annual general meeting has to be held. The first of these half-yearly meetings was held on Tuesday last week at Manchester. It has been felt for some time by nearly all the members that the old Articles of Association did not confine the management of the Association sufficiently to British manufacturers, and Mr. Butler, of the Electrical Power Storage Co., Ltd., who was elected to take the chair, pointed out to the meeting the somewhat drastic alterations which had been made in the new Articles of Association, and proposed a resolution in favour of their being passed, which was duly carried, as was also the second resolution put by the chairman for the purpose of empowering the committee to re-classify the existing members as soon as the new Articles come into force.

Manufacturing sections consisting of members of the Association who manufacture similar goods have recently been formed, and many points were decided on as to the constitution and management of such sections, the main object being the bringing together of competing manufacturers for the purpose of getting matters of common interest settled. A resolution was passed regarding the desirability of joint action in view of the great increase in the number of exhibitions which are now being promoted, and another was agreed to relating to the formation of a co-operative exhibit by members of the Association at the Turin Exhibition.

The last item on the agenda related to the action of certain municipalities who were out-stepping the bounds of merely using their shops as repairing shops, and were doing a certain amount of manufacturing. A resolution was passed to the effect that it was undesirable for extended powers for manufacturing and trading purposes to be granted to local authorities.

During the last twelve months the membership of the Association has nearly doubled itself, and as most of the new members are large firms, the capital represented by the members of the Association is now some three or four times that which it was.

THE BLACKENING OF METAL FILAMENT LAMP GLOBES

The appeal of Messrs. Marples, Leach & Co. (now Adnil Electric Co., Ltd.) against the judgment of Mr. Justice Parker in the action against them early this year by the "Z" Electric Lamp Manufacturing Co., Ltd., was dismissed by the Master of the Rolls, and Lords Justices Fletcher-Moulton and Farwell on Tuesday, without calling upon counsel for the "Z" Co. to reply. The action was for infringement of patent No. 21,654 of 1906, which covers a process for removing the last traces of carbon in filaments manufactured from compounds of tungsten by combining the carbon with the nitrogen in the ammonia given off by heating suitable phosphorous compounds in vacuo. Phospham is said to be particularly suitable. Messrs. Bergmann, who are the makers of the infringing lamps, did not deny the use of phospham, but claimed that it was not used for removing carbon, inasmuch as in their opinion the blackening of metal filament lamp globes is not due to carbon, but is a tungsten deposit. It was argued that if by their use of phospham to produce phosphorous gases for the improvement of the insulation of the interior of the lamp and so prevent blackening, they did remove carbon, they did not infringe the "Z" Co.'s patent. They did not aim at removing the carbon, and it was immaterial for their purpose whether it was removed or not. The case was reported fully in our issues for February 17th and 24th and March 10th, Mr. Justice Parker holding that there was infringement.

In putting the case before the Appeal Court, Mr. Terrell, K.C., occupied nearly three days in arguing (1) that the Bergmann Company did not aim at removing carbon by the use of phospham, (2) that phospham did not remove carbon, and (3) if it did, it would not prevent blackening, whereas the patent specifically stated that it was one for the removal of carbon to prevent blackening. He also asked permission to call further evidence on the point that by cintering the filaments in an atmosphere of hydrogen, instead of hydrogen, nitrogen, and ammonia, without using any phospham, the carbon contents of the filament were removed to an extent ten times greater than the process used by the "Z" Company, in which phospham was used. Since March of this year all the Bergmann lamps had been manufactured in this way, and a much improved filament obtained, but at the trial before Mr. Justice Parker, he was in ignorance of this fact. This request was not acceded to on the ground that the Bergmann Co. were obviously in possession of this information, and that consequently they could have put it forward at the trial.

G.B. SYSTEM IN MILE END ROAD

In the King's Bench Division on Thursday the libel action Griffiths *v.* Lloyd and others, relating to the experimental installation of the G.B. surface-contact system in the Mile End Road by the London County Council, was announced as settled. It will be remembered that whilst the experiment was being carried out, considerable criticism of the action of the London County Council was made by a number of daily newspapers, including the *Daily Chronicle*, the *Star*, and the *Morning Leader*. Mr. Justice Lawrance was informed that a settlement had been arrived at on the terms of the newspapers in question making an apology and paying a substantial sum in damages. The apology took the form of it being pointed out that the criticisms of the system made by the papers were only intended to refer to the system as laid down by the London County Council, who had introduced certain modifications, against which the G.B. Co. had protested. It was never intended to attack the G.B. system *per se*, but only the modified system as installed by the London County Council. Prominence was given in the apology to the fact that the G.B. system is working most successfully at Lincoln. Consequently the action for libel was withdrawn.

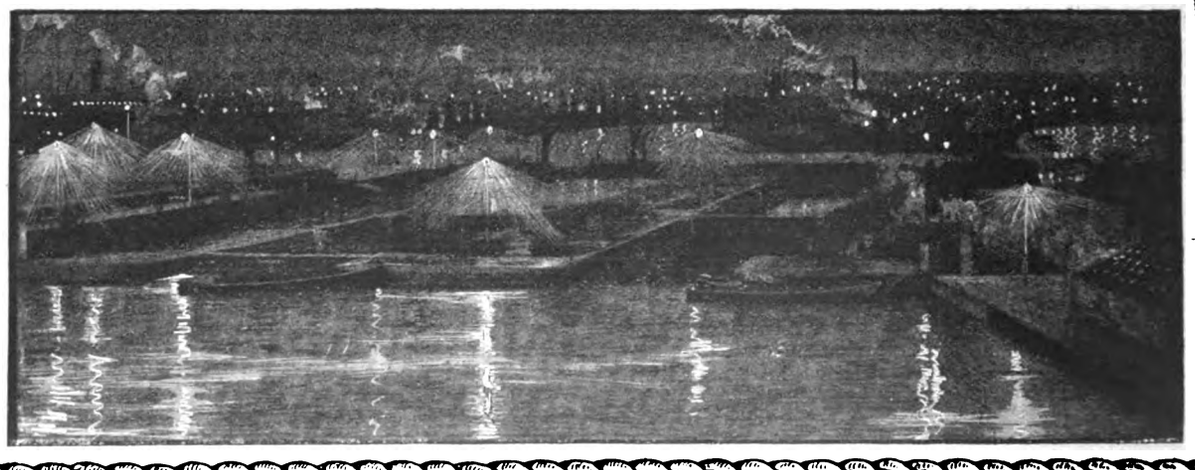
CONRADTY'S CARBONS

"NORIS" C. CONRADTY

for Flame Arc Lamps give a Light which for Brilliance, Steadiness and Reliability, is unequalled.



Conradty Carbons are well known in the Electrical World and their adoption never fails to give satisfaction. For the effective Lighting of Public Thoroughfares, Railway Stations and Docks, Conradty's Carbons are admittedly superior to all other makes. They are of Better Quality, they give a Stronger, Steadier and more Brilliant Light and last longer than other Carbons. Conradty's Carbons are Durable, clean in use, and as free from deposit as possible. They are made in the largest Carbon Factory in the World. They are used by the War Office, the Admiralty, General Post Office, Colonial Governments, the Railways, Dock Companies, Municipalities and Leading Manufacturers of Arc Lamps in the United Kingdom. These large users, by their constant custom, give practical expression to their high opinion of Conradty's Carbons.

Full Particulars will be supplied on applying to the

SLOAN ELECTRICAL CO., Ltd.

LOCAL NOTES

Argentine: *Electric Supply.—The Review of the River Plate* states that the electric power station at San Francisco (Cordoba) has been inaugurated. The Sociedad Co-operativa Luz Electrica de General Belgrano has been formed with a capital of $70,000.

River Plate Telephones.—The change over to central battery working at the Avenida exchange of the United River Plate Telephone Co. has now taken place. About 4,000 subscribers are connected to the exchange.

Ashton & Hyde: *Tramway Purchase.*—The 21 years' lease of the Oldham, Ashton & Hyde Electric Tramways Co. will expire in a few years, and the various Councils concerned in the lease are now holding meetings to consider the advisability of undertaking a joint purchase when the time arrives. It is understood that the Company are prepared to double the track, which is at present single line, on condition that a new lease for 21 years is granted.

Birmingham: *Completion of Power Station.*—The second portion of the Summer Lane power station has now been completed. Alderman Bowater, Lord Mayor of Birmingham, last week ascended the 230 feet chimney stack and laid the last brick. The Summer Lane power station was opened four years ago with a plant capacity of 8,500 kw., but the capacity of the completed station is 19,000 kw. It may be mentioned that in connection with the proposed extension of Birmingham, the King's Norton Council have consented to agree on condition that the King's Norton electric lighting provisional order is put into force by the Corporation.

Buenos Aires: *Electric Supply.*—According to the *Review of the River Plate* a number of French and English business men residing in the Argentine propose to form a limited company for the supply of electrical energy in Buenos Aires. It is proposed to ask for a concession for 40 years. Our contemporary adds that they are not aware of the capital of the new company, but "it will be exceedingly venturesome to commence a competition against the existing company, which has its mains extended in every direction, and also seven power stations.".

Burry Port: *Electric Supply.*—An electric lighting provisional order is to be applied for.

Burton-on-Trent: *Meters on Tramcars.*—The Tramways Manager reports that the introduction of meters on the tramcars has resulted in a saving of electrical energy amounting to between £10 and £20 per month for the 20 cars in use.

Cheltenham: *Municipal Wiring.*—The Electric Lighting Committee are still undecided whether to recommend the Council to support the proposed Bill of the Municipal Electrical Association conferring wiring powers upon all municipalities. At the last meeting of the Corporation the matter was again discussed, and referred back to the committee in order that they may hear the further objections of the local contractors to the Bill.

Croydon: *Meters on Tramcars.*—It is stated that the experiment of fixing meters on every tramcar to check unnecessary waste of current has resulted in a saving of £6,000 a year.

Edinburgh: *Electricity Revenue.*—A document has been prepared by the City Treasurer dealing with the finances of the various departments of the Corporation. In regard to the electric light undertaking he points out that the rates have never been called upon in any way; indeed, since 1897 no less than £49,242 have been transferred to the relief of rates out of the profits of the undertaking. It is pointed out that the interest and redemption charges average over 6 per cent. per annum, and that thus the undertaking does not get the benefit of cheap money. The City Treasurer expresses the opinion that it is open to serious question whether such a system of indirect taxation, which bears on the small number of consumers of electric light, and which does not apply to either the gas or water undertaking, is justifiable in itself and fair to the electric light undertaking and the consumers.

Street Lighting.—According to the annual report of the Inspector of Lighting in Edinburgh, the streets are at present lighted by 1,229 arc lamps, 22 incandescent lamps, and 10,293 gas lamps. The cost of arc lamps has been decreased from £20 per lamp in 1895 to £9 per lamp at present.

Hastings: *The Dolter System.*—An agitation has been started with the object of substituting the overhead system for the Dolter system along the sea front.

India: *Street Lighting.*—The Calcutta Corporation have put in an experimental street lighting installation. Flame arc lamps have been adopted, and the experiment is to be continued, with the assistance of the Calcutta Electric Supply Co., for two months.

Japan: *Imports of Electrical Machinery.*—In a British consular report dealing with the trade of Kobe last year, it is stated that whilst the proportion of British imports of electrical goods to German and American machinery has increased greatly, and British electrical machinery is much esteemed by the Japanese, the great difficulty to contend with in Japan is that cheapness is likely to outweigh considerations of quality. Many new electric light and tramway companies were started during 1909, and these have increased the demand for British-made wires and cables. There are now many small cable manufacturing stores in Japan, but only one can be said to compete in quality with the imported goods, and this one is equipped with British machinery and has the services of a British cable expert.

Jerusalem: *Electric Supply.*—It is stated that tenders have been invited from European firms for the erection of an electricity works. It is intended that the undertaking shall be run by a company, but that the municipality have the right to purchase at the end of a term of years.

Liverpool: *Tramway Receipts.*—During the nine months of the present year the tramways receipts show an increase of £15,000 over those of the corresponding period of last year.

London: *London County Council: New Tramways.*—In addition to the tramways for which powers are to be sought in the next session of Parliament, the Highways Committee have made some further recommendations involving a total length of seven miles at an estimated cost for construction, exclusive of cars, car sheds, sub-stations, &c., of £163,290.

Camberwell: Electricity Accounts.—The Council have made representations to the London County Council as the purchasing authority of the County of London Electric Supply Co.'s undertaking, calling attention to the absence of statements in the company's accounts relating to each of the undertakings authorised by the company's various Provisional Orders. The London County Council support the views of the Borough Council that the accounts should be kept separate, and are in communication with the Board of Trade on the matter.

Marylebone: Current for Electrical Vehicles.—The Electricity Committee propose that current for electrical vehicles should be supplied at ½d. per unit between 11 p.m. and 6 a.m. for a minimum consumption of 100,000 units per annum. Between 6 a.m. and 11 p.m. the price is to be 1d. per unit. The General Manager is to have the right to cut off the current altogether in case of emergency.

Tramways.—The Improvements and Housing Committee recommend that the Council should not give their consent to the tramways proposed by the London County Council from Marble Arch to Cricklewood; Marylebone Road to Swiss Cottage; and Edgware Road to Upper Baker Street.

Street Lighting.—A total of 3,367 gas lamps have now been converted to electricity.

Matlock: *Electric Supply.*—Messrs. Bullen, of Bradford, propose to apply for an electric lighting Provisional Order.

Newcastle: *Trolley Omnibuses.*—The Castle Ward Rural District Council have refused to give their consent to the running of trolley omnibuses through the Westerhope district by the Corporation.

Peru: *Proposed Electric Railway.*—It is stated that a concession to use the waters of the River Chancery, or Pasamayo, has been granted to a syndicate for the purpose of an 80-mile electric railway between Hancon and Huacho.

Scarborough: *Stoppage of Tramways.*—A conference took place in London last week with regard to the proposal of the Scarborough Tramways Co. not to run a service during the winter. The company are strongly opposed to a continuation of the service during the winter, and threaten that if this is imposed upon them, they will discontinue the whole service. It is possible that a local inquiry will be held by the Board of Trade.

Swansea: *Tramway Purchase.*—A committee has been formed to carry on negotiations for the purchase of the Swansea Improvements & Tramways Co. Notice has been given to acquire compulsorily two sections of tramway, the periods for which will shortly fall in.

Torquay: *The Dolter System.*—It is anticipated that the conversion of the whole of the tramways to the overhead system will be completed by next Easter.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bury St. Edmunds.—A loan of £1,430 has been granted for additional machinery and mains.

Carlisle.—A new feeder is to be laid in Lowther Street.

Sanction has been given to a loan of £7,645 for new plant, and £5,000 for additional mains.

Kinross.—A proposal to light the street by electricity is under consideration by the Town Council.

Liverpool.—The West Derby, Liverpool, and Toxteth Park Joint Hospital Committee invite tenders for a complete installation of electric lighting at the Hospital for Consumption at Heswell. Particulars from the Clerk to the Committee, Brougham Terrace, Liverpool, and tenders by October 24th.

London: *Battersea.*—The L.C.C. have advanced £9,004 for extensions at the electricity works.

Stepney.—The L.C.C. have advanced £7,150 for electrical extensions.

Shoreditch.—The sum of £350 is to be expended upon new meters and demand indicators, and £311 upon a main in Regent's Row.

Oldham.—A loan of £12,544 has been sanctioned for feeder cables, repayable in 20 years.

Roumania.—Tenders are invited by the Town Council until November 22nd for the erection of an electricity works for the town of Focshani.

Spain.—The Spanish Government have decided, owing to the high cost of obtaining such apparatus in Spain, to invite foreign competition for electric lighting and other supplies required by the various Government departments.

Swindon.—The Electrical Engineer has been instructed to prepare a report upon extensions at the electricity works.

Wednesbury.—A loan of £4,600 for extensions at the electricity works has been granted without a local inquiry.

Yarmouth.—A Local Government Board inquiry was held last week concerning a loan of £5,800 for street lighting, cooling tower, and mains.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Reconstruction of the Miller General Hospital, Greenwich.

Additions to Cottage Homes, Goldie Leigh, Plumstead.

Eight houses, Aurelia Road, Croydon. W. Langridge, Brighton Road.—Eleven houses, Bingham Road. R. Palmer, Sherwood Road.—Six houses, Parchmore Road. H. C. Reynolds, Kensington Avenue.—Eleven houses, Leander Road. C. Bradford, Brixton, S.W.—And nineteen houses, Portland Road. J. W. Hall, 54 Ashchurch Road, Croydon.

The architect for Mr. Hammerstein's new opera house in Kingsway is Mr. Bertie Crewe, 75 Shaftesbury Avenue, W.C.

A loan of £17,500 has been granted for the erection of an elementary school in Pitshanger Lane, North Ealing.

New headquarters for Salvation Army at Hackney.

Additions to Stoke Newington Co-operative Society's premises.

Rebuilding of Jewish Synagogue, Mile End, recently destroyed by fire.

PROVINCES.

Ayr.—Alterations to County Hospital.

Bacup.—Secondary School and Technical School at Waterfoot. Architect, Mr. H. Littler, Ribblesdale Place, Preston.

Chadderton.—New Town Hall.

Dundee.—New Hospital. Medical Officer of Health.

Edinburgh.—Additions to factory of Messrs. T. & H. Smith & Co., chemical manufacturers.

Glasgow.—Conversion of building in Hopehill Road to electric theatre.—Warehouse and offices in Bishop Court. J. G. Deans, Bishop Street, Anderston.—Electric theatre at 592 Dobbiesloan.—Laundry at Royal Samaritan Hospital for Women.

Govan.—Rebuilding of Messrs. M'Ilwraith's works in Broomloan Road.

ELECTRICAL OUTBREAKS.

"KYL-FYRE" THE FIRE EXTINGUISHER

¶ It is the only Fire Appliance that can be used with safety on a live Cable.

¶ It is now installed in nearly all the largest Electricity Works throughout the Kingdom, and numerous letters have been received stating that it has been the means of preventing serious loss.

¶ It is a non-conductor, therefore is unequalled for all Electrical Outbreaks.

Price 5/- each.

Guaranteed to remain effective for a number of years.

TESTIMONIALS.

THE POTTERIES ELECTRIC TRACTION CO., Ltd.
Tramway Depot, STOKE-ON-TRENT,
October 3rd, 1910.

Messrs. Kyl-Fyre, Ltd., Eastbourne.

Dear Sirs,

On two occasions we have had fires behind the main switch-board due to the fusing of cables, and these were quickly stopped by the use of your Extinguishers. In one case at least considerable damage would have been done had the fire not been quickly got under.

Yours faithfully,
(Signed) W. THOM, General Manager.

THE CLYDE VALLEY ELECTRIC POWER CO.,
55, Bothwell Street, Glasgow.
August 11th, 1910.

Dear Sirs,

We recently had occasion to use two of your "Kyl-Fyres" for an electrical outbreak at Bellshill Switchhouse, and these were found to do their work satisfactorily. We shall feel obliged if you will let us have renewal charges for two extinguishers.

Yours faithfully,
For the CLYDE VALLEY ELECTRIC POWER CO.
(Signed) D. M. MACLEOD, Resident Engineer.

FULL PARTICULARS—

KYL-FYRE, Ltd., Eastbourne, and 92, Market St., Manchester.

Digitized by Google

Hull.—Additions to Gourock Rope Co.'s warehouses.—Extensions to British Oil and Cake Co.'s mills.—Theatre, Anlaby Road Assembly Hall, Spring Bank. Mr. W. H. Bingley.—Additions to works of Messrs. T. Jackson and Co. —New works for Messrs. Reckitt & Sons at St. Mark Street. —Additions to the Hull Hide, Skin, & Fat Co., Maxwell Street.

Hyde.—Town Hall and police buildings.

Leeds.—Alterations and additions to Union Infirmary, Becket Street. Architects, J. M. Bottomly & Welbourn, 13 Bond Street, Leeds.

Liverpool.—New sorting office, Rice Lane. W. Gilruth, H.M. Office of Works, Liverpool.

Loughborough.—Proposed Concert Hall. Parks Committee.

Macclesfield.—Council school on Byron Street site. Builders, Messrs. G. Roylance & Co., Ltd.

Manchester.—Tenders are invited for the electric lighting of the Corporation power station, Whitworth Street, West Manchester.

Middlesbrough.—Home, in place of cottages in Benjamin Street. Holy Cross Mission.

Nelson.—Public baths.

Newport (Mon.).—Higher Elementary Schools, Stow Hill.

Newton Abbot.—Infirmary.

Northampton.—Post Office in St. Giles's Street.

Penzance.—New pavilion.

Scarborough.—Conversion of Salisbury Hotel into music hall.—Alterations and additions at Secondary School.

Sussex.—Cottage Hospital at Hayward's Heath.

Weston-super-Mare.—Proposed centralisation of County Council Offices.

Windsor.—New reception station at Victoria Infantry Barracks. Director of Army Contract, London.

Wolverhampton.—Workshop for Chillington Tool Co., Ltd., Willenhall Road.

MISCELLANEOUS

Australia.—The Deputy Postmaster General at Sydney invites tenders by November 16th for telephone, telegraph, and electric light material. Particulars from 72 Victoria Street, London, S.W., or 73 Basinghall Street, London, E.C.

Ayr.—The Council have approved of a scheme for lighting "the front" at a cost of over £400.

Beckenham.—A Local Government Board inquiry is to be held concerning a loan of £11,000 for free wiring purposes.

Dublin United Tramways Co.—Tenders are invited for stores, including electrical supplies, for the year to December 31st, 1911. Particulars from the Secretary, and tenders by November 7th.

London: *London County Council.*—Tenders are invited for the supply of various stores during 1911, including electrical fittings, carbons, insulating materials, cables, wires, and electric lamps. Particulars from the Clerk to the Council, and tenders by October 31st.

New Zealand.—The Invercargill Town Council invite tenders for an electric tramway system. Specifications may be seen at Messrs. W. Coward & Co., 91 Finsbury Pavement, London, and Messrs. Alfred Dickinson & Co., Central House, New Street, Birmingham, and Gresham House, Old Broad Street, London.

Norwich.—The Electricity Committee recommend that the scheme for substituting electricity for gas in the public streets be carried out in two portions, and that the first shall include the displacement of 750 gas lamps.

Rawtenstall.—Tenders are invited by October 31st for six single-deck tramcars, complete with trucks and electrical equipment. Particulars from the Borough Electrical and Tramways Engineer.

Law Relating to Engineering.—The first of six lectures on this subject was delivered at Caxton Hall, Westminster, on October 10th, under the auspices of the Society of Engineers and the Junior Institution of Engineers. The lecturer, Mr. L. W. J. Costello, M.A., LL.B., dealt with the authority of the engineer and his duties and liabilities, and at the conclusion of the lecture a number of questions were answered. Tickets can still be had from the Secretary of the Junior Institution of Engineers, 39 Victoria Street, S.W. The fee for the course is 6s. for members of either society, and 12s. for non-members. The second lecture is on Tuesday next at 7.30 p.m.

Stannos Wiring.—The *Cleckheaton Guardian* describes an electric lighting installation at "Fir Dene," Gomersal, the residence of Major H. S. Atkinson, which is being carried out by Messrs. Saville & Walton (Chancery Lane) on Messrs. Siemens Brothers and Co.'s now well-known Stannos system. The saving in time of installations with this system is well shown by the fact that the whole installation of 52 lamps is expected to be complete within 14 days from the commencement of the work.

TENDERS RECEIVED AND ACCEPTED

Calcutta.—Bruce, Peebles & Co., Ltd., have received an order for sixteen 475-kw. La Cour converters for the Calcutta Electric Supply Co.

Folkestone.—The tender of the Folkestone Electricity Supply Co. has been accepted at £36 18s. for re-arranging the electric lighting, and the installation of new fittings, &c., at the Library.

General Post Office.—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained the contract from the General Post Office for "Tantalum" and "Onewatt" lamps.

Gillingham.—An air compressor for the Diesel engine plant is to be purchased from Messrs. Mirrlees & Co. at a cost of £30.

London: *London County Council.*—The tender of Messrs. Kirk & Randall at £22,386 has been accepted for the road work and platelaying in connection with the reconstruction of the tramways from Kentish Town Road *via* Highgate Road to Swains Lane.

The tender of Messrs. Medway's Safety Lift Co. at £282 has been accepted for the provision of an electric lift at 23 Belvedere Road for the tramways department.

Messrs. Reid Bros. are to carry out the duct-laying for the Battersea Park Road to King's Road, Chelsea, and Putney Bridge to High Street, Wandsworth, tramways at £2,140. The cables will be supplied by W. T. Henley's Telegraph Works Co., Ltd., at £7,045, and the switch panels by Messrs. Johnson & Phillips, Ltd., at £200.

The Highways Committee recommend the acceptance of a tender by Messrs. Charles Wall, Ltd., for the erection of the third portion of the Hammersmith car shed at £2,280. The track work, electric lighting, and overhead equipment, &c., is to be carried out by the staff of the tramways department.

Lewisham.—The contract for the complete electrical equipment of the Lewisham Hippodrome has been placed with Messrs. Siemens Bros. Dynamo Works, Ltd. The wiring work has been sub-let to Messrs. G. E. Taylor & Co., Bush Lane, Cannon Street, London, E.C. Siemens' fittings and tantalum lamps will be used throughout. "Stannos" wiring has been specified, and the circuits will be protected by Siemens "Zed" fuses.

Newport (Mon.).—The Corporation has recently accepted tenders as follows:—Carbon filament lamps, Edison & Swan United Electric Light Co., Ltd., and General Electric Co., Ltd.; radiator lamps, Edison & Swan United Electric Light Co., Ltd.; meters, Electrical Co., Ltd., Bat Meter Co., Ltd., British Westinghouse Co., Ltd., and Electrical Apparatus Co., Ltd.; rubber cables, General Electric Co., Ltd.; single paper cables, Callender's Cable & Construction Co., Ltd.; sale of superseded plant, C. D. Phillips, Newport; steel girder work, T. H. Howell, Ltd., Newport; cast-iron pipes, Jordans, Ltd., and Thos. Spittle, Ltd., Newport; and cast-iron stanchions, W. A. Baker & Co., Ltd., Newport.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. N. Bailey, of the British Westinghouse Electric & Manufacturing Co., Ltd., has been awarded by the Manchester Association of Engineers the Constantine Gold Medal for the best Paper read during the year. Mr. Bailey's Paper, which was read during the session 1909-10, was entitled "The Exhaust Steam Turbine."

A lecturer on electric wiring is required at the South Western Polytechnic Institute. (See an advertisement on another page.)

Cable Engineer and Works Manager wanted for a new factory in England (see an advertisement on another page).

An improver is wanted at the Watford electricity works (see an advertisement on another page).

Meters Approved.—The Board of Trade have approved of the Electrical Company's continuous current watt-hour meter, type K.G., and of the means provided for fixing same.

The Board have also approved of the Wright Miniature electricity meter manufactured by the Reason Manufacturing Co., Ltd., of Brighton, and of the means provided for fixing same.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 5s. to £59 10s. per ton (last week, £58 15s. to £59).

Siemens' Rubber Tapes and Solution.—We are informed by Messrs. Siemens Brothers & Co., Ltd., that the net prices for their india-rubber tapes and solution (in Catalogue No. 510 and Reprint No. 510 A), which came into force on April 8th, 1910, have been reduced by 20 per cent., as from Monday, October 17th.

Agencies Wanted.—A Montreal firm of importers wish to be placed into communication with British manufacturers of electrical plant and supplies. Further particulars from 73 Basinghall Street, London, E.C.

Liquidations.—The Appleby Crane & Transporter Co., Ltd., is to be wound up voluntarily. Mr. W. B. Peat, 11 Ironmonger Lane, London, is arbitrator.

A meeting of the Telegraph Printing Co., Ltd., will be held at Krause's Cafe, Bank Street, Manchester, on Nov. 16th at 4 p.m., to hear the liquidator's account of the winding up.

"Zed" Fuses.—Amongst the buildings which are being equipped with Messrs. Siemens Brothers Dynamo Works, Ltd.'s well known "Zed" fuses are the Royal Liver Buildings, Liverpool, the new Y.M.C.A. Buildings, Manchester, the Newport Technical Institute, and the Palladium Theatre, London. At the Stafford works a new shop is now being equipped exclusively for the production of these fuses, and two new sizes to be called "ZIV" and "ZV" respectively, with cartridges for a normal capacity of up to 100 and 200 amps. will be placed on the market in the course of the next few weeks. Those interested should write for particulars to the firm's showrooms and stores at 39 Upper Thames Street, London, E.C.

The Wellman Airship.—We understand from the Holophane Co. (12 Carteret Street, Westminster, S.W.) that the lamps on the Wellman airship were equipped with Holophane steel reflectors.

NEW COMPANIES

SWANN GARLAND.—Registered by Harwar & Son, 22 Chancery Lane, London. Capital £5,000. Dealers in electric light fittings, &c.

FURNACES.—Palace Chambers, Westminster, London. Capital £12,000. Electrical and mechanical engineers.

ELECTRIC FIRE PREVENTION APPLIANCES & GENERAL MANUFACTURING CO.—Registered by H. Dade & Co., 14 Queen Victoria Street, London. Capital £1,000. Electricians, &c.

ELECTRIC POWER PLANTS, Caxton House, Westminster, London.—Capital £15,000 (10,000 preference shares). Contractors for electric plant, turbines and apparatus, suppliers of electricity for light and power, &c., and to adopt an agreement with A. H. Gibbings and P. J. Mitchell. The subscribers are C. O. Bastian, 91 Palmerston House, London, E.C., electrical engineer; A. H. Gibbings, 17 Gambier Terrace, Liverpool, electrical engineer; P. J. Mitchell, Caxton House, Westminster, electrical engineer; and D. Bennett, Caxton House, Westminster, engineer. The first directors are P. J. Mitchell, C. O. Bastian, and A. H. Gibbings.

CARLTON ENGINEERING CO.—Carlton House, Regent Street, London. Capital, £6,000. Electrical, mechanical, and general engineers.

UNITED SHERARDIZING.—Registered by Hills, Godfrey & Halsey, 23 Queen Anne's Gate, Westminster, London. Capital, £60,000 (14,000 five per cent. preferred ordinary). To acquire the right to use the process known as "sherardizing" and to acquire certain patents, and to adopt an agreement with Mr. T. H. Nelson.

TELEPHONE SUBSCRIBERS' PROTECTION ASSOCIATION.—144 St. Vincent Street, Glasgow. Capital limited by the guarantee. To combine telephone users and to protect their interests

ALLIANCE ELECTRICAL STORES.—Registered by Messrs. Slaughter & May, 18 Austin Friars, London. Capital, £25,000 (47,500 preferred ordinary shares of 10s. each, and 1,250 deferred ordinary shares of £1 each). To acquire the business of the Alliance Electrical Co., Ltd. (in liquidation).

LLANGEFNI ELECTRIC LIGHT & POWER CO.—66 Victoria Street, London. Capital, £3,000 (2,750 five per cent. cumulative preference). To supply electricity in Llangefni.

PROGRESSIVE ENGINEERING CO.—Registered by A. H. Atkins, 27 Fetter Lane, London. Capital, £500. Electrical and mechanical engineers.

WHIPPLE & CO.—9 Cook Street, Liverpool. Capital, £2,500. To acquire the business of electrical engineering contractor now carried on by C. R. Whipple at the above address.

LYNESS SYNDICATE.—Registered by Jordan & Sons, 116 Chancery Lane, London. Capital, £3,500 (2,000 deferred). To develop the Lyness patent electric motor control finger and tip.

J. B. SAUNDERS.—9 York Street, Westminster. Capital, £20,000. Electrical and Mechanical Engineers.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Deutsche Gasglühlicht A.-G. (Auergesellschaft), Berlin.—The report for the past year shows a net profit of £512,000, as against £202,000 for the previous year. A dividend of 50 per cent., as in the previous year, is recommended.

New St. Helens & District Tramways Co.—The accounts for the year to June 30th show a net profit of £1,589. After paying a dividend of 1½ per cent. per annum, the sum of £390 is carried forward.

Cleveland & Durham Electric Power Co.—It is proposed to reduce the capital from £1,000,000 to £700,000 by cancelling the 1,081 £5 deferred shares held in trust for the company for the purpose of surrender; reducing the remaining deferred shares from £5 to 10s. each; and reducing the ordinary shares from £5 to £4 each.

Callender's Cable & Construction Co.—Dividend at the rate of 10 per cent. per annum on the ordinary shares, less tax.

Drake & Gorham.—There was a net profit of £5,757 for the year to June 30th, and after payment of a dividend at the rate of 4 per cent. per annum, a balance of £1,142 is carried forward.

Stothert & Pitt.—Dividend of 2½ per cent. for the half-year, making 7½ per cent. for the year, and placing £900 to reserve, carrying forward £2,455.

Montevideo Telephone Co.—There is a net profit of £20,564 for the year to July 31st. £11,000 are transferred to depreciation, and final dividends at the rate of 5 per cent. per annum on the preference shares and 6 per cent. per annum on the ordinary shares are recommended, carrying forward £3,921.

Pachuca Light & Power Co.—An issue of £800,000 five per cent. first mortgage fifty-year bonds is being made, for which the principal and interest are unconditionally guaranteed by the Mexican Light & Power Co. The price is 88½. The latter company will supply the Pachuca Co. with power.

The Electro-Harmonic Society.—The first concert of the season will be held at the King's Hall, Holborn Restaurant, on Friday evening, October 21st, Mr. S. Z. de Ferranti in the chair. Succeeding concerts are fixed for November 21st, December 16th, January 13th, February 21st, and March 24th. The ladies' nights will be November 21st and February 21st.

Telegraph Traffic.—Owing to a violent cyclone, communication with Cuba has severely suffered, all the land-lines being down. It has also affected through traffic to the West Indies beyond the Island, which is being sent by other routes. The Cuba Submarine Telegraph Co.'s cables along the south coast of Cuba have not, so far as it is known at present, been damaged. Telegrams to Portugal *via* Spain are subject to delay, excepting by the direct line and *via* Bordeaux. The Rome-Constantinople line was down on October 17th, but restored on the 18th inst.—The Réunion-Mauritius cable was repaired on the 17th, having been inoperative since May 19th last.

Workman's Compensation.—In the King's Bench Division on Monday before Mr. Justice Channell, a case was commenced in which a Mr. Settle sued the Sheerness & District Electric Power & Traction Co. and the Queensborough Wharf Co. for the refund of £300 paid by him to the widow of an employee who was killed through coming into contact with an overhead main. It appears that the Power Company, without the consent of the Board of Trade, and contrary to the regulations concerning high-tension wires, carried a cable over the building, and within 5 ft. of the roof, in which the employee in question was working. In the course of his duties he came into contact with the wire and was killed, and Mr. Settle, as his employer, was ordered to pay £300 as compensation. He claimed that the accident was due to the negligence of the two companies mentioned above for not fixing notices as to the danger, and also for having put up the wire contrary to the law. When the case for Mr. Settle was concluded the judge intimated that he was not at all clear on the law relating to such a case, and suggested that the best way would be for the parties to come to terms. Acting on this suggestion the parties conferred together, and settled the action, but the terms were not disclosed.

SUMMARY

OUR special correspondent in Ceylon sends some particulars of such scope as there is for electric light and power in the island, and describes the recent advances in the telegraph and telephone systems. (Page 677.)

A NEW pattern of petrol-electric omnibus chassis is described, in which the road wheels are driven through differential and worm gear by a single series-wound motor supplied by a dynamo coupled to the petrol engine. Direct-drive is not resorted to at any speed, and starting and speed control is effected by means of the engine throttle valve and the dynamo field. The motor field is shunted at top speed. No storage battery is carried, and the maintenance costs are claimed to be exceedingly low. Two such vehicles have recently been dispatched for public service in India, and a modified pattern is to be employed in London. (Page 678.)

A SHORT description is given of the stage lighting control arrangements at the "Little Theatre." (Page 680.)

MR. A. W. Gamage made some very cogent remarks on the subject of gas *v.* electric street lighting at the head of a deputation to the Holborn Borough Council. (Page 680.)

WE are able to give some particulars of the street lighting installation with overhead mains which has been put down at Dowlais by the Merthyr Electric Traction & Lighting Co. (Page 681.)

AN ampere-hour meter, recently introduced by the British Thomson-Houston Co., is described on page 682.

THE Marylebone Electricity Department are making very rapid progress in the replacement of gas fires by electric radiators in their district. (Page 683.)

IN his presidential address to the Institution of Automobile Engineers, Mr. F. W. Lanchester spoke in favour of petrol electric drive, on the "auto-mixte" system for vehicles of moderate speed. (Page 683.)

A WELL-KNOWN maker of arc lamps criticises our figures for cost of carboning in our special articles on shop lighting. (Page 684.)

AN anti-vibration metal filament lamp for use in mills, factories, ships, &c., has been introduced. The tungsten filament is divided up into a larger number of short loops than is usual, and has a specially elastic suspension. (Page 684.)

STEPS are being taken by the Marylebone Electricity Department to encourage the use of electric vehicles by giving special rates for current for accumulator charging during non-peak hours. A new service of electric omnibuses is contemplated, and there are rumours of the extended introduction of electric vans. (Page 685.)

A REVISED standard specification for steel wiring conduit has been issued by the Engineering Standards Committee. The specified length of the thread on the end of tubes is shorter, so as to avoid the butting of the tubes in coupling pieces. (Page 685.)

THE Lodge-Muirhead Wireless & General Telegraphy Syndicate, Ltd., will shortly petition the High Court for an extension of term of a patent granted to Sir Oliver Lodge in 1897, relating to wireless telegraphy, and claiming the use of inductances in the oscillating circuits for tuning. (Page 685.)

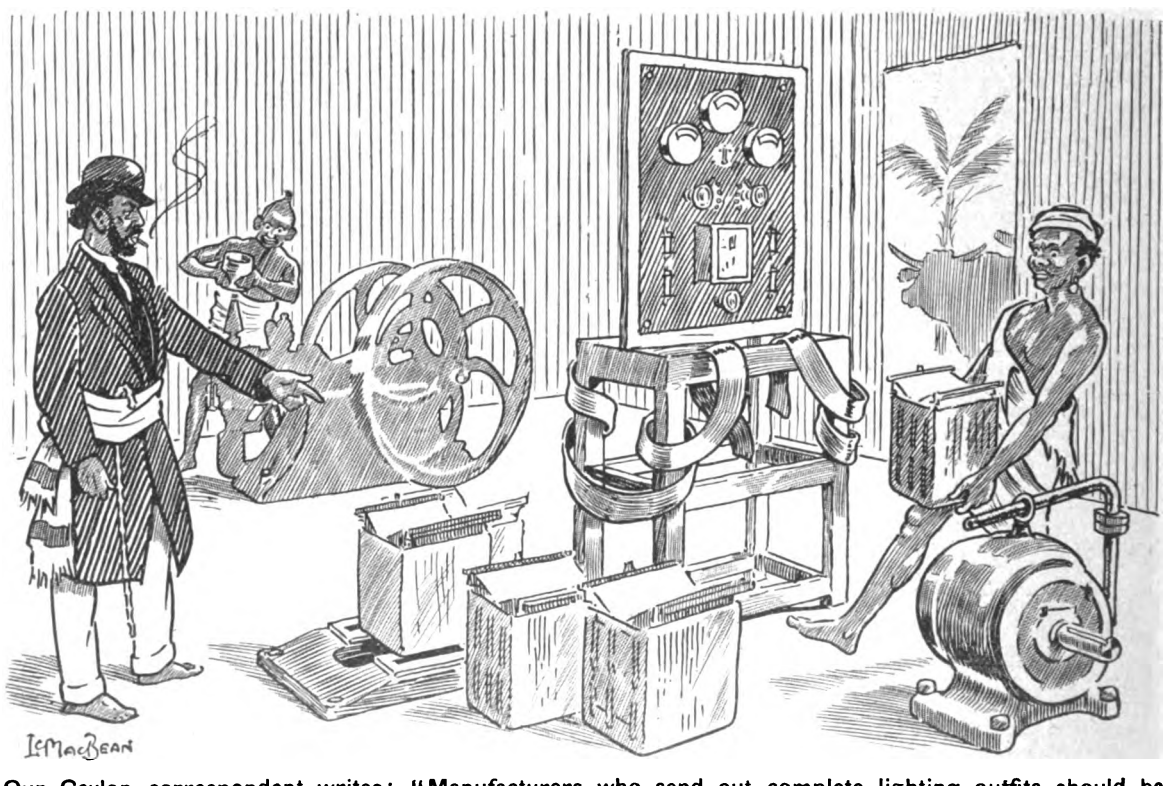
IN the Appeal Court on Thursday, the decision of Mr. Justice Parker early in the year, in which he declared the Ilgner patent for the electrical driving of reversing rolling mills to be invalid for want of subject matter, was upheld. The Court expressed the opinion that the Ilgner patent merely combined the Ward-Leonard system with the addition of a fly-wheel, and that no

Digitized by Google

new result was obtained by the combination. (Page 686.)

The arbitration to determine the price to be paid for electrical energy by the Paisley District Tramways Co. to the Paisley Corporation was continued in London on Tuesday. The Corporation urge that comparisons between the prices paid in other towns and in Paisley are quite irrelevant to the question now being considered, and that the only basis upon which the charge should be calculated is the cost to the Corporation. It was stated in evidence that at present the profit made by the Corporation from the tramway supply is only 0·65 per cent. on the capital expenditure. On the other hand, the Company claim that the power-station, which contains over 4,000 kw. of plant for a load which has never yet reached 2,000 kw., is very much overloaded with plant, and that this accounts for the inability of the Corporation to decrease the price. (Page 686.)

A room eight yards square in London is to be lighted by gas instead of electricity. The *Journal of Gas Lighting* is jubilant. (Page 687.)



Negotiations between manufacturers of electric motors and of machine tools in America have resulted in certain rules being recommended with regard to the standardisation of outputs, speeds, and dimensions of small D.C. and A.C. motors. (Page 687.)

Among the specifications published by the Patent Office on Thursday last were two by the British Thomson-Houston Co. describing respectively a trolley head for a railless electric vehicle, and a system of electrical marine propulsion in which a special turbine is provided for reversing.—W. R. Bousfield, K.C., covers a mercury standard resistance combined with a thermometer tube which may be graduated to read direct in ohms.—The ventilation of storage battery cells for boats is the subject of a patent by The Tudor Accumulator Co.—Application has been made for the restoration of two patents by H. Pieper covering respectively the combined operating lever and the automatic solenoid control of the Pieper Auto-Mixte petrol-electric system for motor-cars. The patents expired last March owing to non-payment of renewal fees.—Opposition has been entered to the grant of a patent to Siemens Bros. & Co. for an automatic telephone exchange system employing two-fold selection. (Page 688.)

Bushey Council are recommended to support an application by the Hertfordshire County Council to run trolley omnibuses.—The London County Council have passed a large scheme of tramway extensions. The veto of the Borough Councils may be the subject of a conference.—Opinions on the Brighton Council are divided as to the proposed tramways to Worthing.—There is a possibility that the new St. Paul's Bridge may be designed without provision for running tramways over it.—In consequence of certain insinuations regarding the management of the electricity undertaking, the Borough Electrical Engineer at Worthing has demanded an inquiry. (Page 689.)

Extensions are to be carried out at Bahia Blanca, Birmingham (£143,250); Edinburgh (£14,000); Islington (£19,365); Southwark (£1,830); Woolwich (£5,285); New Zealand (£50,000); Pembroke (£14,000), and Southend (£17,859). Motors and transformers are required at Warrington, cable at Peterborough, and tramway stores at Bradford. (Page 690.)

Messrs. Ferranti made a profit of £31,236 during the past year. Satisfactory results were recorded at the meetings of the Clyde Valley Electric Power Co. and Messrs. Drake & Gorham. The proposals to reduce the capital of the Cleveland & Durham Electric Power Co. have been approved. (Page 692.)

Our Ceylon correspondent writes: "Manufacturers who send out complete lighting outfits should be more careful in sending full instructions for their erection. In one case a high-class London firm sent out a very complete plant without *any* instructions whatever. As the writer found it, everything, including oil engine, dynamo, and even accumulators, had been erected all together in a small galvanised iron shed." The above is our artist's conception of the manner in which the plant may have been disposed.

ARRANGEMENTS FOR THE WEEK

FRIDAY, OCTOBER 28TH.

Physical Society.

5 p.m. At Imperial College of Science, South Kensington. Exhibition of a New Method for Producing High-tension Discharges, by Prof. Ernest Wilson and W. H. Wilson.

Institution of Electrical Engineers: Manchester Local Section.

7.30 p.m. At Midland Hotel. Inaugural Address by Chairman, Mr. J. S. Peck.

SATURDAY, OCTOBER 29TH.

Association of Mining Electrical Engineers.

3.30 p.m. Notts and Derbyshire Branch. At University College, Nottingham. Discussion on Presidential Address.

5.30 p.m. Warwickshire Branch. Imperial Hotel, Birmingham. Discussion on "The Resistance of the Human Body to Electric Currents," by Mr. W. Foster, and on the Presidential Address.

6.30 p.m. Lancs. Branch. Grand Hotel, Manchester. Discussion on the President's Address with reference to examinations.

MONDAY, OCTOBER 31ST.

Institution of Electrical Engineers: Newcastle Section.

8 p.m. At Armstrong College. Address by the Chairman, Mr. C Faraday Proctor.

TUESDAY, NOVEMBER 1ST.

Electrical Contractors' Association.

3 p.m. At Frascati's Restaurant, Oxford Street, London. Discussion on "Means to be taken to improve the status and efficiency of our Association."

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. Supper and Smoking Concert, Mosley Hotel.

Institution of Civil Engineers.

8 p.m. Presidential Address by Mr. Alexander Siemens and presentation of medals and prizes.

ELECTRICAL ENGINEERING IN CEYLON

(From Our Special Correspondent)

CEYLON can hardly be described as a profitable field for exploitation by manufacturers of electrical machinery and apparatus, but all the same, there is a steady stream of imports of an electrical character. These in 1909 reached the total of £15,000, and the figure shows a fixed tendency to advance. The largest importer is the Government, with £8,700 to its credit for telegraph, telephone, and electric lighting material. It is satisfactory to note that of the total only £300 worth of material was obtained outside the United Kingdom. Ceylon is an island of practically the same area as Ireland, and it might be expected to show a greater consumption of electrical goods than is actually the case. But this cannot be, so long as the country remains, as it is, principally agricultural, and that largely of a primitive type. Manufacturing industries scarcely exist, and although there are plumbago mines, they are worked in very primitive fashion by hand labour. In one of these mines, owned by a European near Kandy, however, an electrically-driven pump has been installed, supplied from an oil-engine-driven generating set. A certain amount of power is used in the tea industry, but the scope for electricity here is very restricted, as the type of machinery is not specially adapted for electrical driving, either from its high speed or scattered distribution. As water-power is plentiful in the tea country, the usual power outfit for a tea factory consists of a water turbine of, say, about 50 h.p., with a crude oil engine for occasional and reserve use during the dry season. Crude oil is obtained at cheap rates from the Burmah and Borneo oil fields, and forms in all respects the most suitable fuel for Ceylon. The rubber industry is a rapidly developing one in Ceylon, but this, again, calls more for cheap primitive labour than for the aid of electrical machinery.

Electric lighting of tea factories and estate bungalows has been indulged in to an increasing extent since the introduction of metal filament lamps, but the units required are very small, a 10 h.p. plant sufficing for a large factory and adjoining bungalows. Unlike sugar mills, tea factories do not continue operations day and night. Manufacturers who send out complete lighting outfits of this description should be more careful in sending full instructions for their erection. In one case a high-class London firm sent out a very complete plant without *any* instructions whatever. As the writer found it, everything, including oil engine, dynamo, and even accumulators, had been erected all together in a small galvanised iron shed.

Practically the only heavy electrical machinery imported is that required for the upkeep of the small electric lighting and tramway systems of Colombo and Kandy. The price of electrical energy is so high (8d. per unit) that it is useless to expect any rapid development in this field, more particularly so as the local companies make no reduction in the price of energy supplied for fans.

The Government appears to have made a start with the water-power development at Blackpool for the electric lighting of Nuwera-Eliya, the hill sanatorium of Ceylon. The installation will only be a small one—enough for lighting the principal hotels, Government offices and private bungalows in the town.

More rapid development is to be noticed in the telephone system of the Colony. Late last year two new exchanges were opened in Kandy and Nuwera-Eliya respectively; and this year trunk lines are being constructed to link these towns with the capital—Colombo. Early in the present year the planting centre of Galaha was linked up to Kandy by means of silicum bronze trunk wires run on the existing telegraph poles. Some of this special construction work would look strange to English eyes; in this last instance the country is extremely hilly, and the spans extend from hill-top to hill-top, in some cases covering a quarter of a mile in one span. The planting community is very much alive to the value of telephonic communication between and among its scattered estates and districts. Considerable enterprise has been shown in the starting of small exchanges, each serving its district within a radius of about ten miles, and of these there are now a fair number in operation. The attitude of Government towards these enterprises has been one of friendliness, and on the understanding that they are not worked on a profit-making basis, they have been supplied with telephone material by the Telegraph Department at cost price. A circular letter to the planters, recently issued by Government, shows that it is their intention gradually to take over such local systems, and weld them into the general telephone system of the Colony as opportunity offers.

The Colombo telephone system continues to grow at the rate of about 20 per cent. per annum. If this rate continues it will soon be the largest system in the East. According to the last Administration Report some difficulty has been experienced in keeping level with the demand for new connections, and this is caused, not so much by the normal growth of the European community, as by the sudden realisation by the native mercantile classes of the fact that the telephone is a valuable aid to business.

Early in the year a commencement was made with the laying of underground paper-insulated cables, the contract for this work having been secured by the Helsby Cable Co. Where the routes run parallel or adjacent to tramway tracks, the cables are laid solid in bitumen and earthenware troughing, but apart from such routes the cables are simply armoured and buried direct, with a tile covering for a warning. These cables will only form the main arteries of the network, local distribution remaining on the overhead system. It is apparently intended to retain the existing magneto system—the C.B. system not yet being a favourite in the tropics.

The proposal for wireless telegraph communication between Colombo and Minicoy has been definitely abandoned in favour of a station in Ceylon only. This station will probably be situated on the south-west coast, somewhere between Colombo and Hambautota. From such a position it will have practically unimpeded communication with all shipping, whether to the west, south, or east.

The new building for the Telegraph and Telephone Department is nearing completion, and will form a worthy addition to the many fine modern buildings now going up in Colombo. It is understood that accumulators will replace the primary batteries now in use for telegraphic purposes.

Electric Lighting for Shops and Shop Windows.—The name of Messrs. Drake & Gorham, Ltd., 66 Victoria Street, London, S.W., should have been included among the list of the firms who lent us illustrations for the various articles on "Shop Window and Shop Front Lighting, &c.," in our last issue. This firm has made a particular speciality of fittings for this class of work, and supplies some of the most suitable designs for the purpose, and they also hold very large stocks of Osram and Tantalum lamps for supplying to central station engineers and the electrical trade generally.

Digitized by Google

NEW PATTERN OF PETROL-ELECTRIC OMNIBUS CHASSIS

A NEW pattern of omnibus chassis with petrol-electric drive has been designed by Messrs. W. A. Stevens, Ltd. (Victoria Works, Maidstone), and two have already been despatched to India for public service under a concession granted by the Maharaja of Gwalior. The following is a description of this design, which, we understand, is being adopted, with some slight modifications to reduce the weight, for some public omnibuses for the London street service. It will be remembered that a petrol-electric vehicle under the name of the "Hallford-Stevens" omnibus was fully described in ELECTRICAL ENGINEERING, Jan. 16th, 1908. In that design, there were two electric motors, each driving one of the back wheels through worm gear. A "dead" back axle was employed, and the differential gear was eliminated. This pattern, which has been used by Thomas Tillings, Ltd., has proved highly successful, as regards its running properties and wear. them to consider that the smoothness and charm of the electric drive is spoilt by the introduction of a direct drive at any speed, and that the elimination of the electrical losses by a direct drive is not worth while for the following reason. Under normal conditions of level running at full speed with electric drive, the engine does not require to revolve at the same speed as the cardan shaft, but can be run at a slower and more efficient speed from the point of view of petrol consumption. The efficiency from the petrol tank to the road wheels is claimed to be better than with a direct drive, notwithstanding the electrical losses. With only a light body, a consumption of 11 miles to the gallon has been attained. The reduced engine speed has also advantages as regards comfort of running and wear and tear. As shown in Fig. 1, the dynamo and motor are mounted centrally end to end, and a ventilating fan is attached

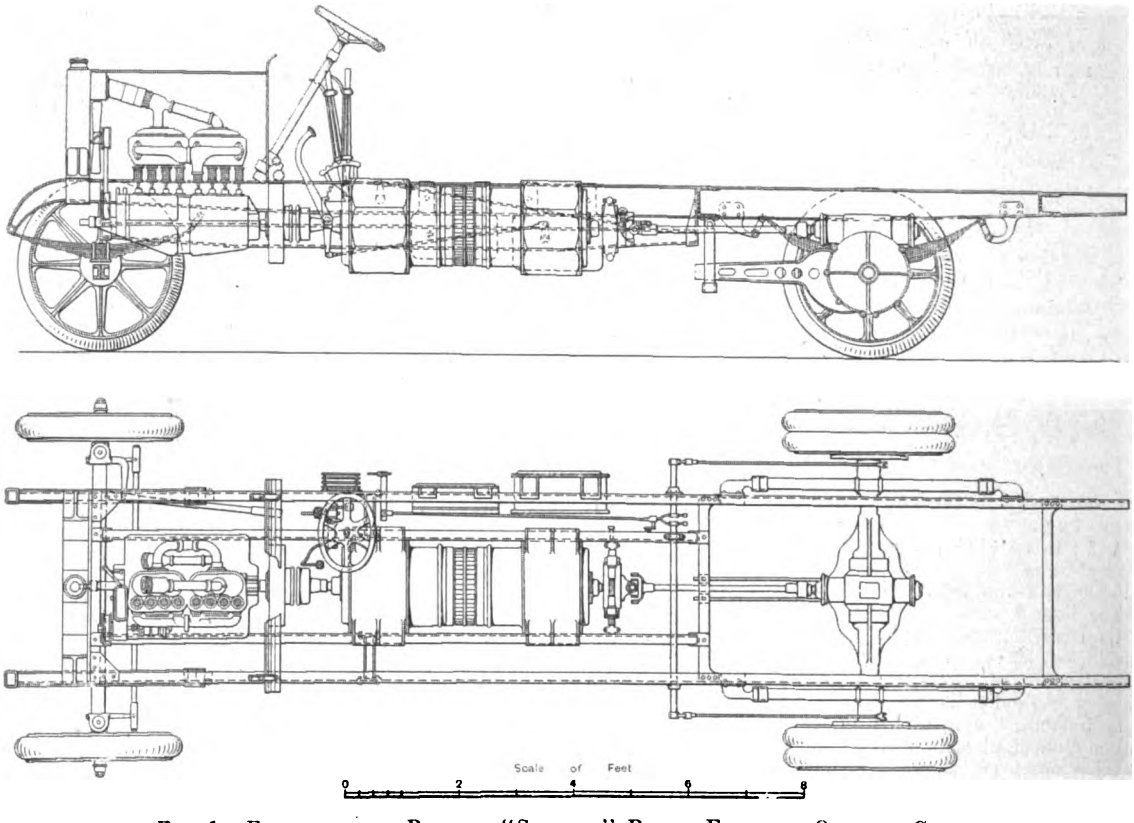

FIG. 1.—ELEVATION AND PLAN OF "STEVENS" PETROL-ELECTRIC OMNIBUS CHASSIS.

The following is an improvement on it as regards efficiency and weight.

In the present design, only one motor is employed, and this is coupled to the road wheels by means of a cardan shaft, differential and worm gear driving on to a "Dennis" 3-ton back axle. The engine is of the four-cylinder (100 mm. bore by 150 mm. stroke) type, developing 35 h.p. at 1,000 r.p.m., and drives a 22 kw. interpole generator through a flexible coupling. The motor, which, like the dynamo, is fitted with ball bearings, is a four-pole enclosed series-wound machine, closely resembling a tramway motor in design, and is controlled without series resistances, by varying the voltage of the generator. A certain amount of control is effected by the engine throttle, however, and on the highest speed the series field is shunted. The transmission is purely electrical even at top speeds, and no direct connection is ever made between the dynamo and motor shafts. Messrs. Stevens' experience has led to the dynamo shaft. The elimination of the clutch and the absence of many of the severe strains associated with direct drive conduce to economical maintenance. The vehicle is provided with a foot brake on the motor shaft, and the ordinary internal expanding side-brakes on the rear wheels.

The main controller and the generator field rheostat are mounted side by side on the outside of the frame, and are easily accessible for cleaning or adjustment. The former is worked by a side lever corresponding to the change-speed lever of a gear-driven vehicle, and has two forward speed positions and one reverse. The generator field regulating rheostat is worked by a small lever moving over a quadrant on the steering column. As can be seen in Fig. 4, the main controller box also contains a main switch actuated by a pedal. This is interlocked with the main controller lever in such a manner that the latter can only be moved when the main circuit is broken, and consequently arcing at the

Digitized by Google

controller contacts is entirely avoided. The engine control is effected by an accelerator pedal, by which the throttle can be opened by foot control, and which, on being released, throttles the engine down to such a speed that the dynamo does not generate even with a full field. It might be thought that only two speed positions would not be sufficient, and with mechanical

The control of the speed of the vehicle is effected almost entirely on the accelerator pedal and the field switch, and under ordinary conditions the main circuit is never broken, even at stopping. Before starting, unless the gradient is very steep, the controller lever is put into the second speed position with the engine running slowly and the generator field reduced, and as

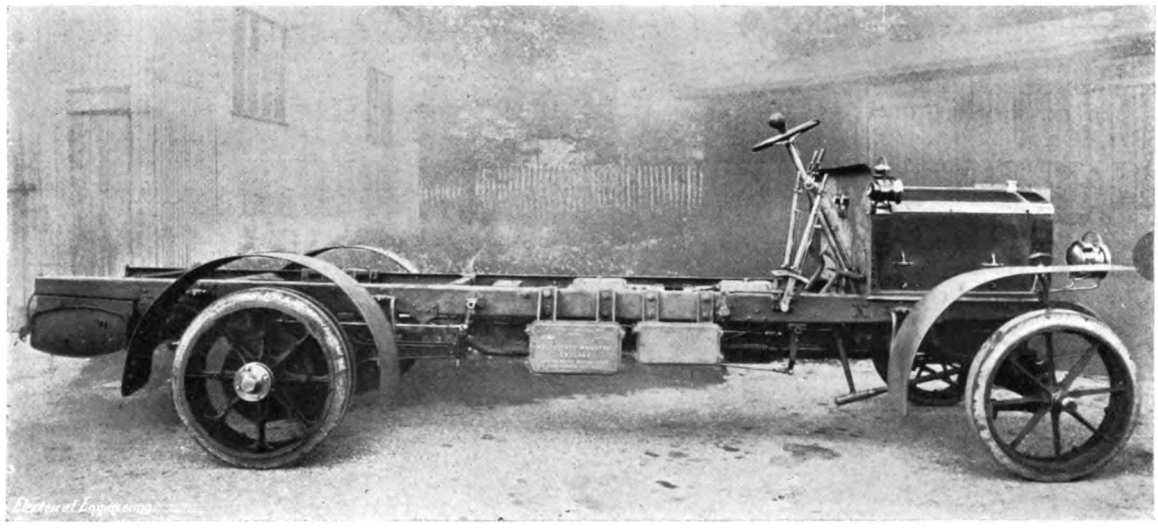

FIG. 2.—"STEVENS" PETROL-ELECTRIC OMNIBUS CHASSIS.

gearing this would certainly be so, but the flexibility of the electrical transmission, owing to the voltage control of the dynamo, and the smoothness with which it takes up its work, go far to eliminate the necessity for a number of steps on the controller. In practice it is found that, except on very steep hills, the controller can be left permanently in the top speed position, upon which all starting and manœuvring in traffic can be done.

The main controller is contained in an aluminium

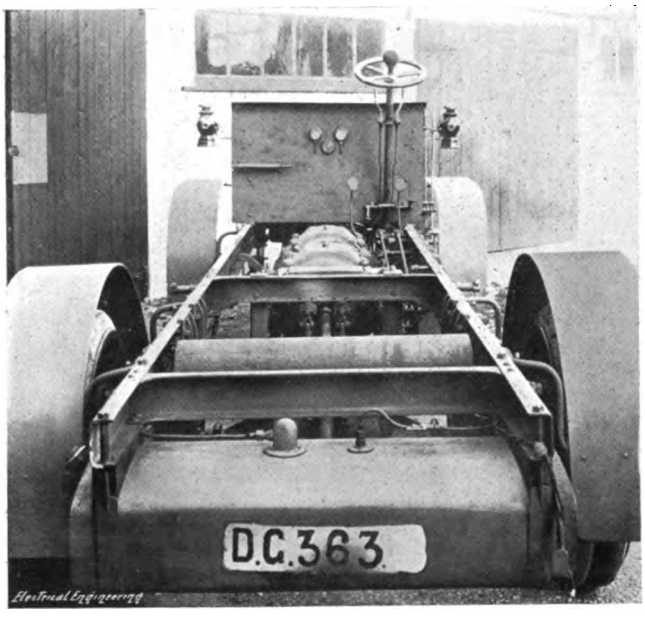

FIG 3.—VIEW OF CHASSIS LOOKING FORWARDS.

case, and consists of an inner and an outer ring of metal contacts on a slate base, arranged as shown. Over these contacts moves a four-arm brush holder connecting the inner and outer rings. The separate main switch, referred to already, is fitted with carbon contacts and a magnetic blow-out. The shunt, which is inserted across the motor fields at the top speed, can be varied to suit the local speed conditions.

no current is generated at this engine speed the vehicle remains stationary. In order to start, the brakes are released, and the engine is accelerated by opening the throttle with the pedal, so that with the increased speed the dynamo excites. The field switch is then gradually brought round to raise the voltage as the vehicle gains speed. The running speed is thus controlled by the throttle pedal. To stop the vehicle, the throttle pedal is released, and the brake applied, without, however, breaking the main circuit. Both the accelerator and main switch pedals are worked by the driver's right foot, and cannot be depressed at the same time. It is thus impossible for the main circuit to be broken when the engine is running fast. Although the prin-

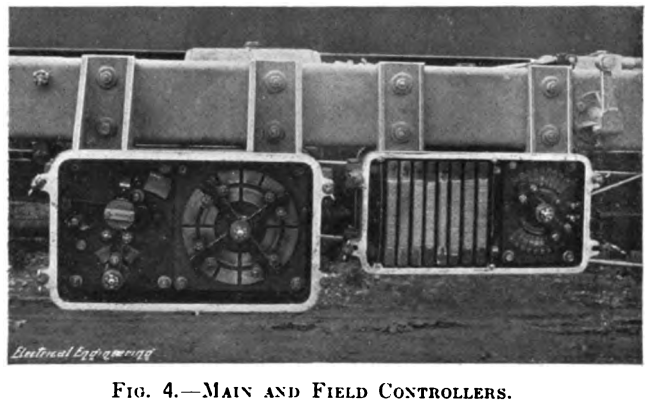

FIG. 4.—MAIN AND FIELD CONTROLLERS.

cipal control is by means of the throttle lever, attention has also to be paid by the driver to the handling of the field switch. If, for example, the field is too strong during acceleration, when the motor is taking a heavy current, the voltage for that particular engine speed will be too high, and the engine will be overloaded. In like manner, when climbing a steep hill at a low speed, a reduction of the field current is necessary in order to allow the engine to get away with the load. A very small amount of practice will enable the driver to know the best position of the field switch for different circumstances. The manner in which it is handled is

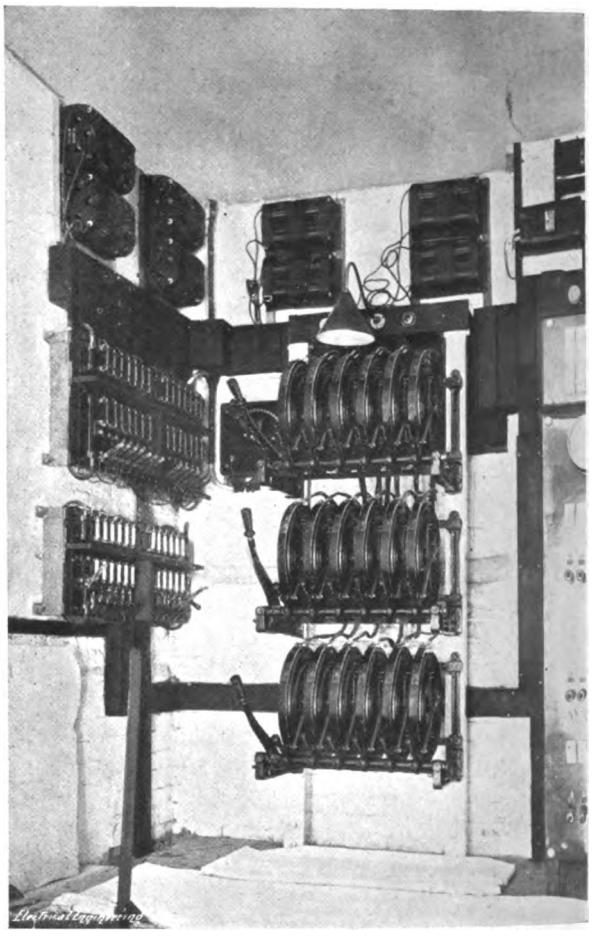
Digitized by Google

not unlike that of the ignition of a petrol engine, which should be retarded when the engine is running slowly and heavily loaded, and advanced for high engine speeds. We had the pleasure of inspecting one of these chassis, and a short ride on it demonstrated the quietness and smoothness of starting and running. We understand that a speed of 40 miles per hour on the level has been attained with this chassis with a testing body.

The "Hallford-Stevens" omnibus already referred to, run by Messrs. Thomas Tilling, Ltd., of Peckham, S.E., has now covered more than 85,000 miles in London public service, and, according to Mr. P. H. Frost Smith, Chief Engineer to Messrs. Tillings, is giving every satisfaction and showing a considerable saving in cost of running as against the company's gear-driven omnibuses. Vehicles of this type are in use by H.M. War Department, the Brighton, Hove, & Preston United Omnibus Co., Ltd., and the Loughborough Omnibus Service, and others of a rather smaller pattern are now running in public service at The Hague.

The chassis illustrated will carry a char-a-banc body to accommodate 40 persons. The weight of the present chassis is 2 tons 17 cwt., which is too heavy for London omnibus service, but we understand that no difficulty will be experienced in building a chassis which will come well within the chassis weight (2 tons 10 cwt.) required to meet the regulations of the Metropolitan Police, as an engine and electrical equipment of less power of that in the present vehicle will be ample for London conditions.

For the past two years these petrol-electric vehicles have been manufactured jointly by J. & E. Hall, Ltd., of Dartford, and W. A. Stevens, Ltd., of Maidstone, under the patents of Mr. W. A. Stevens and the "S. B. & S" Syndicate, the vehicle being known as the "Hallford-Stevens," but owing to the great increase of the business of Messrs. J. & E. Hall, Ltd., it has been arranged that the whole of the petrol-electric work shall be carried out by Messrs. Stevens, Ltd., who now construct the chassis at their Maidstone works, and hold the whole of the electrical patents relating to the vehicle, which will be known in future as the "Stevens" petrol-electric chassis.



STREET LIGHTING IN HOLBORN

INCIDENTALLY upon consideration of improvements in street lighting by the Holborn Borough Council, a valuable testimony came up in favour of electric lighting. At present Holborn is lighted by gas, and a deputation waited upon the Council, urging the need of improvements, and strongly supporting that the street lighting should be brought up to date by being changed over to electricity. The deputation was headed by Mr. A. W. Gamage, who made a very forceful speech, strongly supporting electricity for street lighting. The testimony is especially valuable, coming, as it does, from one whose successful achievements quite properly give his utterances the weight of authority. Mr. Gamage said that he held no brief for electric light or gas companies, nor had he any interest in either. He simply spoke out of his experience as a large consumer of electric light, as his business spent over £3,000 per annum on electric light. He maintained that electric light penetrated fog better than gas. Walking from Chancery Lane to Oxford Circus (which is electrically lighted), Mr. Gamage said, was like stepping from darkness into sunshine. Where they had light they were bound to get the public. To find the value of electricity over gas, they had only to take the borough of St. Marylebone: during the past year they had changed a part of their street lighting from gas to electricity, and effected a saving of £1,500 (see ELECTRICAL ENGINEERING, August 25th, p. 547). Mr. Gamage went on to ask what would be the opinion of him if he lighted his up-to-date premises with farthing dips instead of electric light? This, he considered to be the case in Holborn. They were lighting the streets with dips instead of modern lights. Light meant prosperity for the tradespeople of Holborn, and where there was prosperity there was happiness.

STAGE LIGHTING AT THE LITTLE THEATRE

WE are able to illustrate the bank of theatre dimmers which control the stage lighting at the new "Little Theatre," which has been established by Miss Gertrude Kingston in John Street, Adelphi. The whole scheme of stage lighting and dimming was designed and carried out by Mr. W. E. Siday, electrician to the theatre, and several new features have been introduced. The dimmers themselves are of the Adams Manufacturing Co.'s "Simplicity" type, and on the switchboard the now well-known Siemens "Zed" cartridge fuse has been used for the first time for theatre work. The whole control gear is very compact. Owing to the very small amount of space available, the ordinary liquid type of dimmer was out of the question, and after several tests the Adams Co.'s "Simplicity" dimmer was chosen as presenting many advantages in compactness and flexibility.

These dimmers are mounted up in banks and are operated by means of levers from the front. These levers are arranged with a very neat interlocking movement, so that the whole

BANK OF DIMMERS AND PART OF STAGE SWITCHBOARD AT THE LITTLE THEATRE.

bank can be operated by means of one master lever, if necessary. This interlocking is achieved by one-half turn of the handle. The drive from the operating handle to the dimmer plate is by means of a rigid rod. The advantages of this over the old-time flexible cable drive or tracker wire are at once apparent.

The other features are easy renewal of any faulty plate. Any one plate can be immediately withdrawn, and a new one inserted, without disturbing any other plate. It is possible with this form of dimmer to obtain an instantaneous flash, an effect which is quite impossible with the old form of liquid dimmer, with its acid pots and long length of tracker wire. Further, the resistances are so designed that they can be kept in circuit for long periods without overheating. Anyone who has endeavoured to do the same thing with the old liquid type must know the trouble and difficulty of keeping a steady light, owing to the boiling of the liquid.

The installation is further noteworthy inasmuch as mercury-vapour lamps have for the first time, been successfully employed to give winter and night effects.

STREET LIGHTING BY OVERHEAD MAINS AT DOWLAIS

THE new system of public lighting which has recently been inaugurated at Dowlais is interesting as one of the examples, rare in this country, of public lighting by overhead mains, embodying certain modifications and improvements in the construction of the aerial lines, and also as another case where a victory has been won by electricity over gas for street lighting.

Dowlais is by no means an unimportant district, historically or at the present time, having one of the largest iron and steel works in its midst, and being an important coal centre and market town. Three years ago the enterprising Corporation of Merthyr Tydfil (incorporated some five years ago), saw, after some experiments, the advantages of metal filament lamps for street lighting, and straightway gave the Merthyr Electric Traction & Lighting Co. the order to light the two miles of main street connecting the towns of Merthyr and Dowlais, by means of lamps on brackets fixed to every tramway-pole throughout the route between the termini of the tramways—the lamps being supplied with current from overhead wires attached to the tramway poles, arranged to be switched on and off from the works, and forming an entirely separate circuit. Following this came a contract for the street lighting of the main street from Pontmorlais to Cefn Coed, and likewise from Pontmorlais to the north-west boundary of the Corporation area on the Swansea Road. All the lamps in these two branches also are fed from overhead lines, fixed in the case of the route to Cefn Coed on the poles of the Cefn route of the tramways; and in the case of Swansea Road, on wooden poles, and controlled by "Venner" time switches.

At the end of 1909 the company were asked by the Council to tender for the lighting of the whole of the Dowlais district. This was by no means a simple problem, as the area is very congested in Dowlais itself, and it did not seem feasible to design a network to suit the local conditions on the methods of aerial construction usually adopted. A scheme was, however, put forward whereby about one-third of the lamps would be fed from underground mains, and the remaining two-thirds from overhead mains. After considerable local opposition, this scheme went through with only slight modifications.

The area covered by the new network is within four square miles, and in this area there is a multiplicity of streets and cross-streets, into nearly every one of which the mains had to be taken.

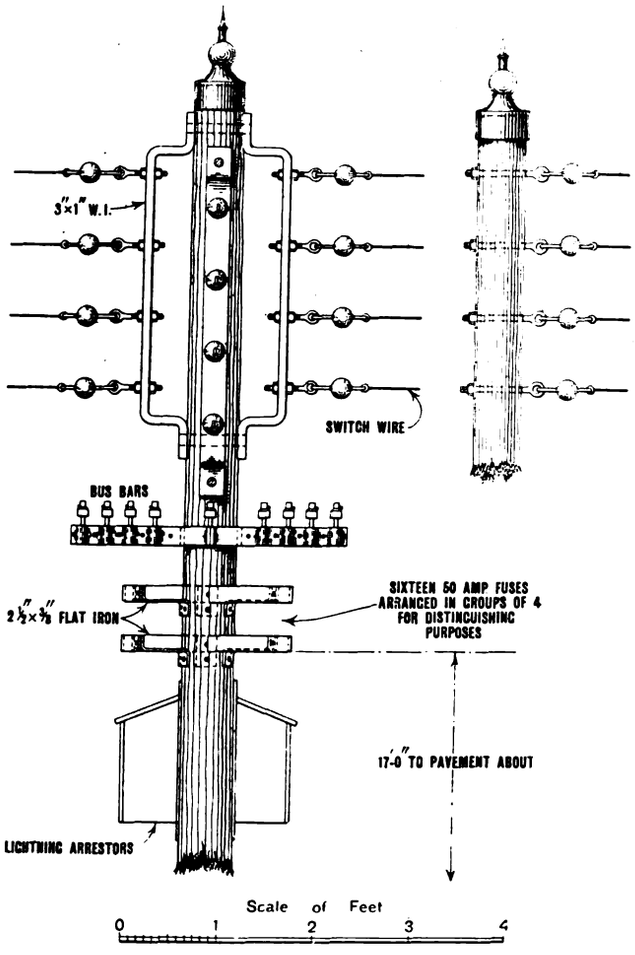

FIG. 1.—FOUR-WAY DISTRIBUTING POLE AND FOUR-WIRE TERMINAL POLE.

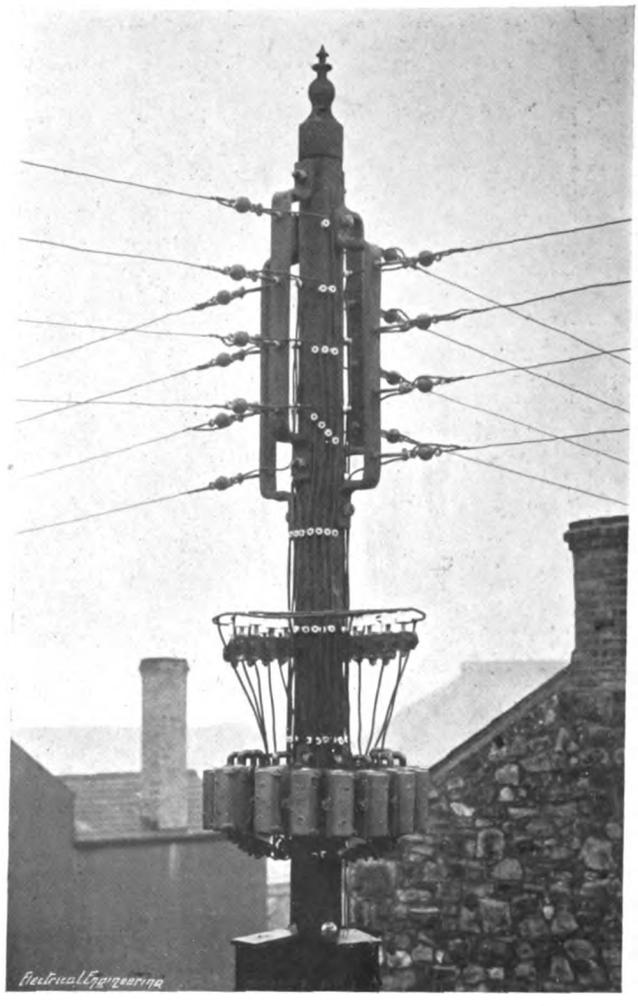

FIG. 2.—FOUR-WAY DISTRIBUTING POLE, SHOWING FUSES, 'BUS-BARS, &C.

The details shown in Fig. 1 will indicate the way in which the difficulty was got over without the use of unsightly cross-arms and shackle insulators that would otherwise be needed to branch a set of wires four or more directions if necessary. It was also the endeavour to make the work look symmetrical, and as pleasing to the eye as possible. The pole illustrated on the left is a four-way pole with fuses and lightning arresters. The 'bus-bars are of 19 18s rubber-covered cable, arranged on their insulators in circular form, and a 50-amp. fuse is provided for each circuit.

The factor of safety of the brackets and the steel bolts attaching them to the poles is very high, but although the work is heavy it does not look out of proportion. The two- and three-way poles are generally

Digitized by Google

similar, and the simplest form; the terminal pole is shown on the right.

Fig. 2 is a view of the top of a pole carrying a set of 'bus-bars, fuses, and lightning arresters to deal with the disconnecting, &c., of four sets of wires branching in four different directions taken from a tower-wagon. The fuses are of heavy pattern supplied by Messrs. Johnson & Phillips, with suitably protected porcelain handles. The 'bus-bars will be seen above the fuses, and the lightning arresters underneath. The arresters used throughout the system are the B.T.H. adjustable magnetic blow-out type.

Fig. 3 is a view at Caeracca, showing three wires branching off at right angles from four wires, and an ordinary straight line pole with outrigger stay is shown in Fig. 4. These illustrate some of the methods

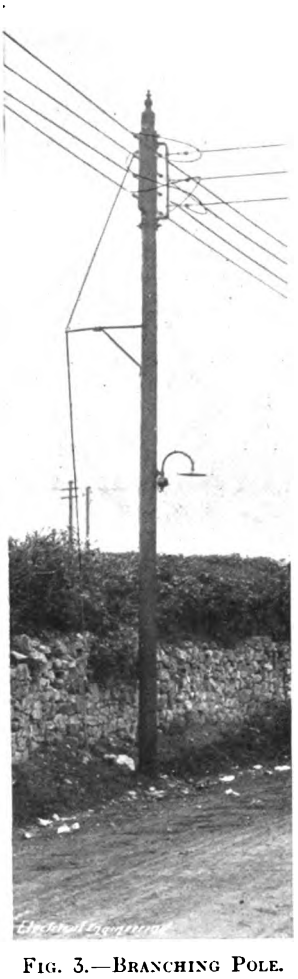

Fig. 3.—Branching Pole.

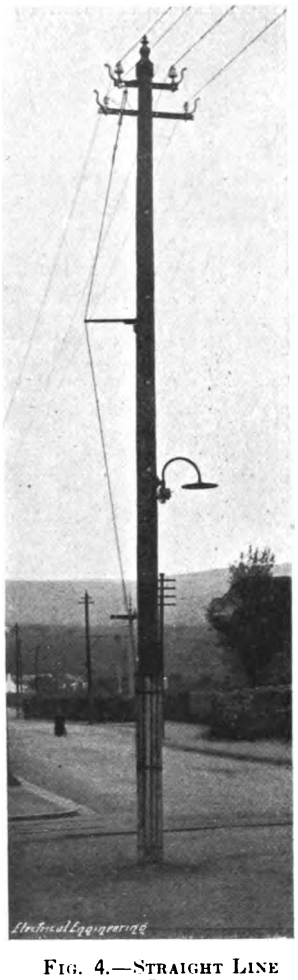

Fig. 4.—Straight Line Pole.

generally adopted, but the types of poles required for the various arrangements of corners are naturally very numerous. It was suggested that some of the mains should be attached to brackets fixed to the houses, but unfortunately time did not permit of the necessary arrangements being made.

The lamps in Dowlais which are fed from the overhead mains are switched on and off from three points. This is accomplished by utilising one of the neutral wires specified in Reg. No. 5 of the Board of Trade, for conductors on the three-wire system, as a switch wire, insulating it from the other neutral wire by means of small ball insulators inserted in the bridles, and connecting one side of the street lamps to it. The process of switching on is then by simply closing a single-pole switch or a time switch, joining the insulated neutral switch wire with the other neutral. In streets where a service of 230 volts is required three wires are used.

The advantage thus obtained is that the networks are always alive for private supply, yet the public lamps can be switched on simultaneously and independently in the different districts.

The total number of lamps in Dowlais is at present 241. Some are single lamps, others double, ranging from two —32 c.p. to two —50 c.p. This, together with the other contracts in Merthyr gives an approximate total of 550 points lit by electricity. Both tantalum and Osram lamps are used with success.

The life of some of the Osram lamps has been known to exceed 3,000 hours, which is very good, considering that no globes are used to protect them. The brackets which are attached to the poles were supplied by Messrs. Lucy & Co., of Oxford, and they include a very practical and serviceable switch-fuse, which a man can re-fuse without any danger of shock. The ironwork has been made at the company's own depot. In fact, everything possible has been done locally by the company.

The whole installation has been put in from the designs of Mr. Lewis W. Dixon, managing engineer, Merthyr Electric Traction & Lighting Co., Ltd., to whom we are indebted for these particulars and the photographs with which this article is illustrated.

AN IMPROVED AMPERE-HOUR METER

An improved type of continuous-current house-service mercury ampere-hour meter has been developed and placed on the market by the British Thomson-Houston Co., Ltd., which is claimed to possess material advantages over other designs, in that its characteristic curve closely approximates a straight line from full-load down to one-twentieth of full-load, the meter starting to register easily with a load equal to half per cent. of its rated capacity.

The design of this meter has been so carefully worked out that it has been found unnecessary to employ the compounding coils which are a feature of many other meters of this type. This meter therefore has the advantages of a very

B.T.-H. Ampere-Hour Meter.

small voltage drop and watt loss, has no hysteresis error, and is unaffected by short-circuit currents.

The meter is calibrated by altering the electrical circuit and not by distorting the magnetic field, so that a very permanent calibration is obtained. All parts of the meter are made of metal which will not warp with changes of temperature or excessive heat, and as they are made standard and interchangeable, any part can be readily replaced from stock. The B.T.-H. mercury ampere-hour meter, which is illustrated herewith, has been approved by the Board of Trade, and is calibrated to read in B.O.T. units at any specified pressure up to and including 600 volts.

ELECTRIC v. GAS HEATING IN MARYLEBONE

THE Marylebone Electricity Department must be creating a record in the installation of electric radiators in substitution for gas fires, for since the middle of September orders have been coming in on the average for eight radiators per day. The department has standardised, so to speak, the Dowsing lamp radiators as the result of experience, and now fit only these. The sizes being put in are the eight, six, and four lamp. Among the most noteworthy instances of the change from gas to electricity in this connection is that of a doctor who conducts a large nursing home, where gas fires were used throughout. Radiators have been put in on trial and tested for the amount of heat given out, and found to be quite satisfactory. The Borough Council guaranteed the cost based on 1d. per unit, and the doctor has now decided to install radiators throughout. Even on the question of price alone, the price of gas, which is at present 2s. 8d. per thousand in the district, would have to be reduced to 1s. 8d. per thousand in order to compete with electricity. Another instance is that of a large house where a short time ago £50 per annum was paid for electricity for lighting, whilst the gas company's bill for heating was £150 per annum. The Marylebone Electricity Department is now receiving at the rate of £100 per annum for light and heat, and the gas company £50, whilst within the next fortnight Mr. H. H. Holmes, the Sales Manager of the Marylebone Electricity Department, expects that the gas heating will have been done away with. The keenness which is being shown at Marylebone at present in pushing radiators is well justified by the results, as this class of business is so fully occupying the staff that certain developments in regard to electric cooking have had to be put on one side to some extent. Tests made of gas fires have in many instances proved that they were costing as much as 4d. per hour, and it has been amply demonstrated that, under normal conditions, a 12- or 8-light radiator costs less per hour, with electricity at 1d. per unit, than gas.

PETROL-ELECTRIC DRIVE FOR AUTOMOBILES

IN the course of his presidential address to the Institution of Automobile Engineers on Wednesday, October 12th, Mr. F. W. Lanchester made some remarks on the possibility of the usual mechanical change-speed gear, which he admitted was the weakest point in the chain of mechanism, being superseded by other methods. The alternatives which he considered were hydraulic transmission, electrical transmission, and what he defined as electrical auxiliary. On the basis of efficiency alone, purely hydraulic transmission was stated to be far superior to purely electric transmission, and the opinion was expressed that it was improbable that the latter would ever come into use in exceptional cases. He was more hopeful with regard to the use of electrical drive as an auxiliary as applied in the Pieper or "automixte" system, which has often been described in the technical press. In this system a continuous-current machine is coupled direct to the engine, and can act either as a dynamo or a motor.

The petrol-electric installation so constituted is arranged to operate through the medium of a magnetic clutch either on the usual differential, or may be fitted in duplicate and arranged to act by duplicate worm or bevel drives direct on to the road wheels. A storage battery is provided usually of about 5 per cent. of the total weight of the vehicle, which takes up any excess power when going down hill or on a level, and which gives up the energy so stored when required to ascend a gradient. The alternative function of the dynamotor is determined automatically by the speed variation: when the petrol engine is slowed down by excessive resistance the voltage in the armature falls and the battery begins to assist to drive the vehicle; when, on the contrary, the engine attempts to race away, the voltage rises as a consequence, and current flows in the opposite direction and spends itself in the charging of the battery. Likewise when stopping part of the energy is thrown into the battery, and is drawn out again when getting under way.

It will be appreciated, continued Mr. Lanchester, from the detailed discussion of the subject that the future application of the electric auxiliary system more widely than at present in contemplation must rest largely with the question of accumulator weight, not the weight per h.p. hour, that is the energy content, but rather the h.p. output, *i.e.*, the rate of doing work; at present the best results commercially attainable for brief discharges of but a few minutes' duration is the equivalent of one h.p. per 40 lbs. weight. This is reasonably satisfactory for vehicles of moderate speed—less than 20 m./h.—but it is not good enough for the pleasure vehicle. If the battery weight could be reduced to 20 lbs. per h.p. the latter as a proposition would be worthy of serious consideration.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

Glasgow Section of the Institution of Electrical Engineers.—The ninth annual dinner of the Glasgow Local Section of the Institution of Electrical Engineers will be held on Wednesday, December 14th, at the Grosvenor Restaurant, Gordon Street, Glasgow. Tickets, price 7s. 6d., to be obtained of the Secretary.

Single-phase Traction in America.—It is announced that the New York, New Haven, and Hartford Railway have decided upon the electrical equipment on the 11,000-volt single-phase system of the Hoosac Tunnel section of the Boston and Maine line, which is now under their control. This section is double track, and is 25,000 ft. in length. The company have also decided upon the electrification of the New York, Westchester and Boston line, 21 miles in length, partly two and partly four track, and the Harlem River and Stamford and New Haven branches on the same system. The electrification of the terminous and neighbouring lines in Boston is also being considered, but the system is not yet decided upon. Locomotives will be used in the Hoosac Tunnel, and there is room for a clearance of 4 ft. under the overhead conductors. Power will be supplied from a new 6,000 kw. station. The second line mentioned will be run with multiple unit cars, also working direct off the 11,000-volt circuit. Work is commenced upon some of these extensions already.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ELECTRIC WORKS DRIVING.—Messrs. Dick, Kerr & Co., Ltd. (Abchurch Yard, Cannon Street, E.C.), are issuing a handsome new pamphlet, entitled "The Electric Motor in Various Industries," illustrated with an interesting collection of photographs of motors as applied to a great variety of classes of drive, such as pumps, shafting, individual machine tools, textile and other machinery, lifts, printing presses, air compressors, &c. A number of typical power installations are described, and a series of actual wattmeter records are reproduced, showing the way in which the energy drawn from the mains depends on the work being done, and at the same time giving a good idea of the amount of power required for various classes of machinery, which, like much of the information contained in the pamphlet, should be of considerable use to those seeking economy in the driving of their works.

VERTICAL PUMP MOTORS.—A profusely illustrated *brochure* is to hand from the Allgemeine Elektricitäts Gesellschaft of Berlin, describing several patterns of vertical motors, direct and alternating current, for direct coupling to centrifugal pumps for mines, docks, irrigation and sewage works, and other purposes. The motors may be of the open ventilated type, or of the totally enclosed water-tight pattern, as in the case of pump equipments for shaft sinking. A long list of installations completed by the company is appended.

SEMI-ENCLOSED MOTORS.—A leaflet from the A.E.G. Electric Co., illustrates a "protected," or "semi-enclosed" D.C. motor. The inspection plates are of strong design, and allow of free ventilation. The motors are built in standard sizes from 0·15 h.p. up to 30 h.p. Semi-enclosed motors are not supplied for A.C. circuits, the difference in output over totally enclosed A.C. motors being so small.

WIRES AND CABLES.—A new leaflet, which forms an advance price list supplementary to their catalogue section V., dealing with wires and cables, is to hand from the Edison and Swan United Electric Light Co., Ltd. (Ediswan Buildings, Queen Street, E.C.). In addition to the vulcanised rubber wires and cables described as "made by an associated firm in accordance with the standards of the Cable Makers' Association, and sold under a distinct label," a cheaper make of "non-association" cable is also included.

H.-T. OIL SWITCHES.—A leaflet from the A.E.G. Electric Co. illustrates their latest pattern oil switch for circuits up to 15,000 volts.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

GAS ENGINES.—A handsome new gas engine catalogue (in English) has been brought out by the Maschinenfabrik Augsburg-Nürnberg A.G. (M.A.N.), London office, Caxton House, Westminster, dealing very thoroughly with the Nuremburg type of gas engine, of which many illustrations are given, and with the development and applications of the large gas engine generally. Interesting statistics are given of the utilisation of power by gas engines in different countries, and working costs of steam and gas engines are contrasted. The details of gas producer plants as well as engines are discussed, and information is given as to the running and running expenses of actual installations.

TANTALUM LAMPS.—Messrs. Siemens Bros.' Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), and a number of firms and local electricians dealing in tantalum lamps are distributing an ingenious folder representing a miniature packing-case and containing a little paper tantalum lamp. The inside of the folder gives "five reasons why tantalum lamps should be used," and an abbreviated price list.

FITTINGS.—A catalogue from the Benjamin Electric, Ltd. (1A Rosebury Avenue, E.C.), contains particulars of a large range of the well-known Benjamin wireless cluster fitting, special lampholders, reflectors, &c., for shop lighting, and a variety of other fittings, shades, accessories, &c.

ARC LAMPS.—A fully-illustrated catalogue with interesting details of the construction and special features of "Excello" arc lamps, is to hand from the Union Electric Co., Ltd. (Park Street, Southwark, London, S.E.). The deposit-free inner globe and the patent system of ventilation now applied to the "Excello" flame lamp are described. These and the Duplex Excello lamp for long burning hours were fully described and illustrated in Electrical Engineering, February 25th, 1909, Vol. V., p. 179. In the present catalogue, particulars are given as to the adjustment and treatment of the lamps to obtain the best results, and a table giving the mean hemispherical candle-powers which can be obtained with the different sized lamps is included. A number of new patterns of covers for special purposes, including some with square and half-ball reflectors for shop-lighting, and one with a protected globe for factory lighting are illustrated.

GLASS SHADES AND FITTINGS.—A new catalogue from Messrs. W. & R. Jacobs (39c King William Street) illustrates a number of new designs of artistic glass fittings and shades. These include small hanging "lanterns," mostly with translucent glass tops, and the lamps covered by a fringe of glass tubes. Drop pendants and hall lamps are also illustrated, in which the glass is also a more important part of the decorative scheme than the metal work. Some table standards with glass pillars and domes of very original designs are also exemplified. There are also very numerous forms of glass shades for the more ordinary styles of fittings. A useful feature of the list is a series of order forms at the end.

METAL FILAMENT LAMPS.—We have to thank the Imperial Lamp Works, Ltd. (Kingsway House, W.C.) for an excellent coloured reproduction of their striking poster representing John Bull carrying a British-made Brimsdown lamp, in an effective frame.

CORRESPONDENCE

COST OF ARC LAMP LIGHTING.

To the Editor of "Electrical Engineering."

Sir,—With reference to your article on "Shop Front Lighting" in last week's issue, and your remarks about the cost of carbons in flame arc lamps, we beg to state that your figures are, firstly, far in excess of the actual cost, and, secondly, that your statement that employing cheaper carbons runs the risk of having rather an unsteady light is quite erroneous, at least for our lamp.

We can supply an 8 amp. lamp to run absolutely steadily with a carbon cost of 0·18d., the carbons being taken in quantities, of course. You also state in your article that flame lamps can be obtained in various sizes from 300 to 600 watts, but we can supply them to consume only 200 watts with most satisfactory results.

The Gilbert Arc Lamp Co., Ltd.,
J. S. Hecht.

Chingford, October 24th, 1910.

[Our rather wide limits of 0·2d. to 2d. per lamp-hour for the cost of carbons consumed in arc lamps were meant to apply to all patterns of lamps, from those burning the cheapest carbons to those necessitating the use of carbons of perhaps a special shape with copper wires to increase the conductivity and special impregnated cores. We are glad to know that a Gilbert lamp can be obtained for which the carbon cost can be reduced to only 0·18d. per lamp-hour, *i.e.*, 0·02d. below the lowest figure we gave, without the steadiness of the light being affected by the necessarily cheap carbons employed. Our figures of 300 to 600 watts were meant to include the loss in the series resistance.—Ed. *E. E.*]

AN ANTI-VIBRATION METAL FILAMENT LAMP

A MODIFIED pattern of the "Metalik" lamp has been introduced by G. M. Boddy & Co. (15 Gray's Inn Road, London). This has a strengthened filament, and is recommended by the firm for situations where the lamp is subjected to a considerable amount of vibration. The composition of the filament itself is the same as that of the original "Metalik" filaments, and the efficiency is the same, namely 1·25 watts per Hefner c.p., but the filament is arranged in a larger number of shorter loops. Thus for a 100-volt 16-c.p. lamp there are seven short loops in series instead of four long ones. The bulb in this case measures 4½ in. long from end of cap to pip, and the maximum diameter is 2 in. (*i.e.*, about the same dimensions as a 16-c.p. carbon filament lamp). Each loop is supported at the bend by a hooked wire with a wave or loop at its centre to give increased elasticity. This lamp is made for voltages up to 125 volts, and in 16, 25, 32, and 50 c.p. sizes. We are informed that Messrs. Boddy & Co. have already supplied a large number of these lamps to a mill-owner in Yorkshire, who has not previously thought it advisable to use tungsten lamps owing to the vibration in the mills. A special apparatus which subjects the lamps to vibration and jolts is being exhibited at the Brussels Exhibition and elsewhere to demonstrate the immunity of the lamps to such treatment.

The South African Institute of Electrical Engineers.—The last number to hand of the Transactions of the South African Institute of Electrical Engineers contains a paper by Mr. E. D. Brunner on the selection and types of induction motors, in which he compares the field of utility of the squirrel cage and slip ring motor, and discusses the various methods of starting. Stator windings are also dealt with, and the developed lap form with former wound coils, the closed slot arrangement with hand wound coils, and the chain and bar windings are described and compared. Contributions to the discussions on various other papers are also included.

ELECTRIC MOTOR VANS AND OMNIBUSES

Encouragement given by the Marylebone Electricity Department

AS announced in our last issue, the Marylebone Borough Council have had placed before them a scheme for the supply of current to electrical vehicles. The Electricity Committee in their recommendation stated that inquiries are frequently being received in this connection, and, as a result, the Council have approved the following tariff, viz.: A minimum consumption of 100,000 units per annum, to be taken at Aybrook Street, Rathbone Place, or the generating station; the rate to be ½d. per unit between the hours of 11 p.m. and 6 a.m.; this price also to hold good for Saturday afternoons, Sundays and holidays; but no supply to be taken during the evening lighting peak; on other days, between 6 a.m. and 11 p.m., the price to be 1d. per unit, provided that no supply is taken during peak hours. The general manager has the right to turn the current off altogether in case of emergency. For a less quantity than 100,000 units per annum, or for the delivery of current in any other part of the Borough than the stations named above, a higher price will be charged.

We are now in a position to place before our readers some information regarding the circumstances which have led up to this movement on the part of the Marylebone Electricity Department. In short, there is about to take place in London a considerable increase in the number of electrically propelled vehicles, both for private and public use. As a factor in levelling the load curves of electric power stations, a supply for charging the batteries of electrically driven vehicles would prove a boon to central station engineers, and, with characteristic energy, Mr. A. H. Seabrook, Chief Electrical Engineer to the Marylebone Borough Council, is not only making a strong bid for this business at the very inception of what may prove to be quite an important revival of accumulator street traction, but, with the example of Berlin, New York, and other European and American towns to guide him, is taking steps to foster the use of electrically driven delivery vans and travellers' carriages among the large business houses of Marylebone. In spite of the failure of the London Electrobus Co.—which was not wholly attributable to technical difficulties—and the comparative failure of several other forms of electrically driven vehicles in the Metropolis, this problem has been receiving close attention in certain quarters. The conclusion come to is that the running of them is a distinctly commercial proposition, and that, as regards working expenses alone, the margin in favour of petrol driven cars is not so large as is generally supposed. It is in an endeavour to get on the other side of this margin that Mr. Seabrook has evolved his low tariff. As evidence of this, it may be mentioned that a company who are developing the idea, and as a result of whose inquiries the Marylebone tariff has been partly framed, have only just lost by a very small margin a large contract in London, in respect of which a considerable number of delivery vans would have been required. A number of large van users are giving the use of electric vans most serious attention. We understand also that one of the big railway companies have under consideration a scheme for running a service of electric delivery vans in the Metropolitan area.

In regard to public vehicles, a well known firm are going ahead with a project to place a number of electrically driven omnibuses on the routes over which the 'buses of the old London Electrobus Co. used to run. In this case, as with the delivery vans, we understand that Tudor batteries will be used, under special maintenance contracts. As a garage for these 'buses, there is the old boiler house of the Metropolitan Electric Supply Co. at Aybrook Street, which it is intended to reconstruct for this purpose, and then let to the new 'bus company. For ordinary private or traders' vehicles, the Borough Council will provide all the necessary accommodation incidental to the charging of the batteries, in which it is confidently anticipated that a large business will be done in the near future. The opinions of those now moving in the matter are that electrical engineers have not, in the past, given sufficient attention to the working of electrical road vehicles, and have not realised under what conditions they can be commercially successful.

STANDARDS FOR WIRING CONDUIT

THE Engineering Standards Committee have just issued a revised Specification for steel conduits for electric wiring. It is only different in two respects to the previous (1906) edition. In order also to provide a better joint at couplings, the length of the thread on the end of the tube has been slightly shortened so as to prevent the tubes butting inside the connecting piece. The gauging of galvanised iron conduit is to be done after, instead of previous to, galvanising, as difficulties have arisen in the practical carrying out of the Specification owing to the obliteration of the Inspector's stamp by the galvanising process; ordinary conduit is, however, to be gauged at the manufacturers' works before enamelling, as hitherto.

A LODGE WIRELESS PATENT

Application for Extension

THE Lodge-Muirhead Wireless & General Telegraphy Syndicate, Ltd., will shortly petition the Chancery Division of the High Court of Justice for an extension of the term of Patent No. 11,575 of 1897, granted to Sir Oliver Lodge, and any opposition to this extension must be made on or before December 10th, 1910.

The patent in question relates to a syntonised system of wireless telegraphy, in which the receiving apparatus resonates in response to a sufficiently prolonged series of waves of a definite frequency, and various arrangements of transmitting and receiving apparatus are described and illustrated in the specification. For example, a simple oscillating circuit, comprising two capacities with a spark-gap between, is used, and inductance coils are inserted between the gap and each capacity (one of which may be the earth) in order to prolong the oscillations and to secure the emission of a continuous series of waves of a definite frequency. Various methods of setting this circuit in oscillation are described, and a number of constructions for the capacity areas are illustrated.

The first of the eleven claims of the patent is as follows:—"In a system of Hertzian wave telegraphy, the combination with a pair of capacity areas (of which one may be the earth) of a self-inductance coil inserted between them electrically, for the purpose of prolonging any electrical oscillations excited in the system, and constituting such a system a radiator of definite frequency or pitch." The other claims are for means for adapting such an arrangement for the purposes of receiving and giving a cumulative or resonating effect, the use of variable inductances for tuning the circuits to different frequencies, a coherer comprising a needle point resting upon a flat metallic surface, and the use of a transformer in the receiving circuit.

The ground upon which an extension of the term of a patent may be granted is that the patentee has been inadequately remunerated for his invention, and the period of extension may be seven years, or in exceptional cases fourteen years. It will be remembered that Mr. Marconi applied for an extension of his first wireless patent last year, but later decided not to proceed with the application. (See ELECTRICAL ENGINEERING, June 16th, 1910, p. 386.)

Electric Traction on the Prussian State Railways.—According to the last Prussian railway-loan act, a sum of £2.000.000 will shortly be due from the Diet for railway electrification purposes. Of this, £850,000 will be devoted to the equipment of the Lauban-Dittersbach section of the Silesian mountain railway, and £1,150,000 to the continuation of the equipment of the Dessau-Bitterfeld section of the Magdeburg-Leipzig-Halle line, which was commenced last year, a sum of £100,000 having been voted for that purpose.

ELECTRICAL DRIVING OF REVERSING ROLLING MILLS

In March last Mr. Justice Parker, in the Chancery Division, declared the Ilgner patent for the electrical driving of reversing rolling mills invalid for want of subject-matter, on the ground that it involved nothing more than the Ward Leonard system of control, in which the pressure applied to the motor armature is gradually increased by altering the excitation of the generator supplying the current, plus a flywheel applied in a manner suggested in a patent taken out by Ferranti in 1895. The action which brought about this decision was one for infringement of the Ilgner patent in respect of an installation at the works of Messrs. Hickman, Ltd., Bilston, which was put in by the Electric Construction Co., Ltd. (Electrical Engineering, 1909, Vol. V., p. 305, and February 3rd and 10th, and March 3rd, 1910).

The case was carried to the Appeal Court, and was disposed of on Thursday.

Mr. A. J. Walter, K.C., for the owners of the Ilgner patent, argued that the selection of a motor which dropped in speed as the load increased and thus enabled the flywheel to give up energy, and the combination of such a motor with Ward-Leonard control of the generator coupled to this motor, were new, and were subject-matter for a patent. This selection and combination rendered possible the electrical driving of reversible rolling mills, and no other method could be employed, or had been suggested. The selection of such a type of motor was new, as for other purposes motors were designed so as to prevent as much as possible the drop of speed on load. Further, the Ward-Leonard control enabled the available energy of the flywheel to be spread out over any desired period of time, and thus used to the best advantage. Lord Justice Fletcher Moulton, however, stated that he could see no difference either in the means or the consequences of the systems described in the Ferranti and Ilgner patents; in either case, if the heavy load persisted, it would eventually be thrown direct on to the primary generator. In reply, Mr. Walter pointed out that no special means were provided by Ferranti to produce the necessary drop in speed of the flywheel motor, and that there was no intention of applying Ward-Leonard control to the generator of the flywheel set. It was also pointed out that neither Ferranti nor Ward-Leonard mentioned the use of a flywheel for rolling mill purposes, and that it was hard upon the patentee to read in to these documents something which, even if obvious, was not mentioned at all.

Lord Justice Fletcher-Moulton, who delivered judgment, said he came to the conclusion that Mr. Justice Parker was right. In considering the matter they had to find out whether what Ilgner proposed was due to existing knowledge or did it require invention. If any engineer used the knowledge of the time and did not have recourse to invention, he had no more right to a monopoly than anyone else who judiciously used that which science had put in his hands. He was of the opinion that although the problem of electrically driving reversing rolling mills illustrated on a greater scale than any other a certain type of difficulty, yet the means by which this difficulty had been met in the Ilgner patent did not involve any exercise of invention in the legal sense. Ilgner had taken means known to the world and used them on a suitable scale to meet the difficulties with which he had to contend. The only difference was the addition of heavier flywheels, and he protested against any suggestion that a heavy flywheel was patentable. The whole object of putting in the flywheel was to store up kinetic energy, and that was what Ferranti did. As a matter of fact, he did not think even the Ferranti patent was a good one on subject-matter, as the effect of using flywheels, in his opinion, was well known in 1895. The Master of the Rolls and Lord Justice Farwell concurred, and the appeal was therefore dismissed with costs.

The Municipal Wiring Bill.—The Battersea Electric Light Committee recommend the Council to decline to express an opinion on the proposals of the Bill of the Incorporated Municipal Electrical Association relating to wiring, &c., until it has been drafted, and the Council have had an opportunity of considering its provisions.

New Water-power Station in Sweden.—According to the *Zeitschrift für das gesamte Turbinenwesen*, a water-power station has just been completed at the Bullersfors Falls in Dalafluss by a company which are supplying most of the electrical energy to the Domnarfoet ironworks (where important experiments in electrical smelting and refining have been recently carried out) and to the Kvarnsveden paper mills. The total output of the station will be 24,000 h.p. There are six generating sets of 4,000 h.p. each, running at 180 r.p.m. Three-phase current is generated at 7,000 volts, 60 cycles.

THE PRICE OF CURRENT FOR TRAMWAYS

THE arbitration to determine the price which the Paisley District Tramways Co. shall pay the Paisley Corporation for electrical energy was resumed in London on Tuesday. We reported the previous proceedings on page 649 of our issue for October 13th. It may be remembered that the price now paid by the company averages 1·4d. per unit, which it has been paying for the last seven years under the terms of the Act of Parliament authorising the tramways. The period for revision has now arrived, but the Corporation resist any reduction in the price, hence the arbitration.

On Tuesday the case for the company was completed by figures showing that for a maximum load of 575 kw., one 500 kw. generating set should be sufficient, whereas the Corporation actually have a 720 kw. set, two 500 kw. machines, and a 200 kw. motor-generator; consequently the price charged was said to be excessive owing to the capital charges for this unnecessary machinery. Mr. Balfour Browne, K.C., in opening the case for the Corporation, argued that the only basis upon which the charge could be calculated was the cost of generation at the municipal power station, where special machinery had to be put in some years ago to meet the tramway demand. The fact that if they were dealing afresh at the present time with such a load they could generate more cheaply was totally irrelevant to the issue. If the proposals of the Tramway Company were adopted, the Corporation would be losing £4,000 per annum compared with the present revenue from the tramways, and at the present time the profit upon the sales to the Tramway Company was only 0·65 per cent. on the capital expenditure involved, or £313 per annum.

Mr. C. F. Parkinson, the Borough Electrical Engineer, gave evidence in support of having so much tramway machinery in the station. He admitted that there was more machinery than was absolutely required, but declared that this was due to the requirements of the Tramway Company having been originally put at from 70 to 80 cars, whereas it had not exceeded 50 cars. One of the 500 kw. sets, he said, was reserve to the 720 kw. set, whilst the second 500 kw. set had been put in as an alternative to taking out an insurance policy to protect the Corporation against damages from failure of supply. The lowest price for power supply in Paisley is 1·29d. per unit, whilst the tramways supply is metered at the 'bus-bars, leaving the Tramway Company to bear transmission losses. The company put the actual cost to them, taking these losses into account, at about 2½d. per unit, and argue that this is excessive. In cross-examination, it was pointed out that at one time the Corporation had offered to supply energy for one section of the line at 1d. per unit, and, presumably, would have made a profit upon it, but Mr. Parkinson pointed out that this was on the basis of getting a considerably larger demand than at present, and it was only in respect of the additional units necessary for the particular extension. Another point brought out in cross-examination was that the Tramway Company had to suffer by reason of the fact that whilst the station contained plant having a capacity of 4,200 kw., the maximum load had not exceeded 1,720 kw.

Wireless Telegraph Notes.—The Brazilian Government has erected a wireless telegraph station at Amaralina, close to Rio Bermelho. The Telefunken system has been adopted, and the station has a guaranteed range of 400 miles, although its actual working range is far greater. During the trials recently conducted communication was readily established with the wireless station near Rio de Janeiro (about 730 miles) and with a vessel more than 1,000 miles distant. The height of the mast is 197 ft.

It is stated that wireless telegraphy has been introduced among German fishing vessels.

Wireless telegraph stations have been erected on the Sanday and North Ronaldshay Islands in the Orkney group. By this means, it is hoped to maintain communication between the islands during the winter, which has been very difficult with the ordinary submarine cable, owing to constant damage caused by the rocky nature of the sea-bottom.

Consequent upon the acquisition of the Marconi Company's coast stations by the Government, the one at Waterloo, near Liverpool, has been removed to the Seaforth Barracks, and in future will be used solely for the purposes of coast defence. A new station will shortly be constructed at Formby for ordinary commercial messages.

It is stated that the representation of the colonies at the next International Radiotelegraphic Conference will be discussed at the next Imperial Conference. Votes may be allotted to the colonies on the basis of the representation laid down in the Postal Union Convention. At present Newfoundland is the only British colony not participating in the International Radiotelegraphic Convention.

A GAS VICTORY EIGHT YARDS SQUARE

GAS lighting has now to be satisfied with very small triumphs in the matter of interior lighting, and in consequence the *Journal of Gas Lighting* has been very jubilant about the adoption of gas in the place of electricity for the illumination of a room about 24 ft. square in London. It seems that this room is occasionally used for meetings, and is sometimes packed with 150 members. It is only 13 ft. high, and, owing to insufficient ventilation, one can hardly be surprised that the temperature and state of the atmosphere in the room became unbearable, although electric lighting was employed;—it would obviously become equally unbearable during meetings held by daylight. It was decided to employ a new system of heating and ventilation, and, for convenience, gas-heated boilers were employed in connection with the Glover-Lyon heating and ventilating system. The owners of the hall (the Society of Medical Officers of Health, of which, according to the *Journal for Gas Lighting*, Dr. Glover-Lyon is a member) probably thought that as they were putting in gas they might at the same time employ it for lighting, and they did so.

In the description published in our contemporary, it is stated that the Society "had for some years been using the electric light, with the result that, on meeting nights, the rooms became stuffy and unbearable." We may point out, however, that a hall such as this could be quite sufficiently lighted with about five 55-watt metal filament lamps, which could not by any conceivable possibility make the room stuffy, and the increase in temperature that they would produce would be negligible compared with that produced by the presence of 150 members, even if the debate were of the most placid description. There can be no doubt, moreover, that the society would have been far better advised had they employed an ordinary system of heating without unnecessary complications, and had put in an electric fan with an outlet into the open air for ventilating the hall during the meetings.

We can, however, understand their desire to experiment with an elaborate system of ventilation, but we shall not be surprised if the members find the hot draughts exceedingly unpleasant in such a small room. They have adopted the precaution of employing a special ventilating outlet duct to take away the fumes from the gas lighting, but nevertheless we are confident that if they had employed metal filament lamps for lighting, an electric fan for ventilation, and simple ordinary steam heating or even coal fires, the results would have been far more agreeable, and far more economical. Two electric motors are used as it is in connection with the Glover-Lyon ventilating system. The initial cost of the ventilating system employed must also have been far greater than the simpler electrical arrangement which we advocate, but possibly as Dr. Glover-Lyon is a member of the society he has made them a present of the installation.

MOTORS FOR MACHINE TOOLS

THE subject of the standardisation of electric motors for machine tool driving has been engaging the attention of American manufacturers, and it appears that negotiations between the National Machine Tool Builders' Association and the Association of Electrical Motor Manufacturers have resulted in certain rules being recommended. The following is a summary of the more important of these, abstracted from a recent issue of the *Iron and Coal Trades Review*, London.

Machine tools should be equipped with motors with standard ratings of 1, 1½ (D.C. only), 2, 3, 5, 7½, 10, 15, 20, or 25 h.p. Motors outside this range of capacity are not yet to be standardised. The standard voltages recommended are 115 and 230-volts for direct-current, and 110 and 220 volts for alternating-current motors, these voltages being the nominal pressures of the system. The rating of the motors shall be the continuous horse-power output, with standard load conditions. For variable-speed motors used for intermittent work, the rated output shall be the maximum continuous output for two hours, within the prescribed heating limits. Such motors shall have the time as well as the horse-power ratings of the motor for high and low speeds on their name-plates. It is recommended that variable-speed motors, with speed ranges of 2 to 1 and 3 to 1, be included with constant-speed motors in the attempt at standardisation. The following speeds are recommended for variable-speed D.-C. motors:—25 and 20 h.p. motors, 900 to 450 r.p.m. and 900 to 300 r.p.m.; 15, 10, 7½, and 5 h.p. motors, 1,200 to 600 r.p.m. and 1,200 to 400 r.p.m.; 3, 2, 1½, and 1 h.p. motors, 1,500 to 750 r.p.m. and 1,500 to 500 r.p.m. These speeds, it is thought, will be within the limits fixed by the gear or chain drive, while at the same time giving the comparatively high speed desired by the manufacturer of the motor. For polyphase 60-cycle induction motors, the following speeds are recommended:—25, 20, and 15 h.p. motors, 900 and 600 r.p.m.; for 10 h.p. motors, 1,200 and 600 r.p.m.; for 7½ h.p. motors, 1,200 and 900 r.p.m.; for 5, 3, and 2 h.p. motors, 1,200 r.p.m.; and for 1 h.p. motors, 1,800 and 1,200 r.p.m. It is recommended that the shaft diameter should be according to a definite formula; that there should be a fixed proportion between diameter and length of shaft; that keyways be made for square keys, and that the key be equal to one-fourth the diameter of the shaft. It is further suggested that all motors should be held down by four bolts, the bolt-holes being drilled one-sixteenth above size of bolt required. The bottom of the motor should be planed parallel with the shaft. It is further recommended that the bolt-holes be placed in a square, and that the dimensions of this square should be made a function of the horse-power divided by the speed, and further that all dimensions be given in the nearest higher ¼ in. The feet of the motor should extend beyond the body sufficiently to allow for drilling and reaming of the dowel pin-hole while the motor is in place.

Automatic Fog Signals on the District Railway.—An automatic fog signal system which has now been installed on all the above-ground sections of the District Railway is described in the *Railway Gazette*. The apparatus consists of a magazine holding 50 detonators, which is provided with an arm interlocking with the signal mechanism. In normal working the fogging apparatus is disconnected from the signal, but on the approach of foggy weather an inspector or other employee pulls the lever actuating the connection with the signal. The automatic signals work on the "normal clear" system, and on a signal reverting to "danger," a detonator is automatically extracted from the magazine and placed on the track. On the signal clearing again, the detonator is replaced in the magazine, whether used or not, thus reducing the risk of non-explosion through damp or other causes. On the stock of detonators in the magazine being reduced to ten, a whistle of peculiar shrillness is set up until the stock is replenished, the whistle serving as an additional safety factor by warning the motorman of the position of the signal.

Telegraph Traffic and Movements of Cable Ships.—The interruptions to land lines in Cuba and Florida still exist, although the route *via* Havana is now again open, messages going by cable to that city.—The cable between Bonny and Duala is down, and telegrams for Cameroon are sent *via* Bonny. Communication between Rome and Constantinople has been restored, but owing to a cloudburst and flow of mud from Vesuvius, telegraphic lines in the provinces of Naples and Salerno are broken.—There is a rumour of difficulties in connection with the new Atlantic cable of the Western Union Co., but even if it be true, they can only be of a temporary nature.—The Anglo-American Telegraph Co.'s c.s. *Minia* had recently to proceed to mid-Atlantic to repair one of the Company's cables.—The cable steamer of the Commercial Cable Co. was engaged in picking up the abandoned cable from Canso to the point where the cable was diverted to Newfoundland, viz., near Flemish Cap. The *Mackay-Bennett* may soon be in home waters.—By order of the Compagnie Française des Cables Télégraphiques, the *Contre Amiral Caubet* has recently repaired the New York-Cape Haiti cable.—The cable steamer *Pouyer-Quertier* is being overhauled at New York, and it is expected she will leave in a day or so for the West Indies, where she is generally stationed.—The cable between French and Dutch Guiana is awaiting repair.—The cable steamer *Colonia*, of the Telegraph Construction & Maintenance Co. arrived at New York at the end of last month after completing the laying of the Western Union Telegraph Co.'s new Atlantic cable.—The Brest-St. Pierre cable has been attended to by the *François Arago*; the repair is likely to be a costly one.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published October 20th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

24,016/09. **Trolley Head for Railless Traction System.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). A trolley head for collecting current from overhead positive and negative wires run parallel consists of a conical or pyramid-shaped head of insulating material which projects upwards between the wires, and is attached to the pole by a ball joint. Two collector shoes attached to opposite sides of this head engage with the undersides of the trolley wires. Three figures.

26,346/09. **Electrical Marine Propulsion.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). The motor on the propellor shaft is used for forward running only, and is connected direct without switchgear to the generator, which is driven by a high-speed turbine. For reversing, a special low-speed turbine is used. This is coupled to the propellor shaft direct or through gearing, and a clutch enables it to be disengaged when the ship is running forward. One figure.

27,335/09. **Standard Resistance Unit.** W. R. Bousfield, K.C. A standard resistance unit suitable for heavy currents consists of a glass tube filled with mercury, and provided with platinum contacts at each end. These contacts extend into glass cups at each end which may contain mercury and serve as connectors to the rest of the circuit. A vertical tube of fine bore is attached to the main tube, and the mercury rises in it according to the temperature of the whole. This tube may be graduated in degrees of temperature or in ohms. One figure.

4,567/10. **Ventilation of Accumulators.** A. B. Pescatore and Tudor Accumulator Co., Ltd. Cells for boats, &c., are provided with a system of ventilation for removing the gases evolved during charging and for cooling the electrolyte. The gases are removed through an aperture in the centre of the lid, and cool air is introduced by means of pipes passing through the lid near this central aperture and terminating in the corners of the cell. Air may be blown in or suction applied, as is most convenient. Two figures.

11,281/10. **Mercury Contact Tubes.** McKenzie & Holland, Ltd., and S. P. Wood. This covers curved tubes of glass with one flattened end, in which are inserted two short pieces of platinum wire. These wires are fused to stout copper connecting wires, the fused junction and short lengths of the copper wires being enclosed in the glass. A globule of mercury completes the circuit on the tube being tilted. Three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.
Names in italics indicate communicators of inventions from abroad.
Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Hirst and Angold, 24,566/09; Carbone, 5,561/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Marshall [Armouring for cables] 6,706/10.

Dynamos, Motors and Transformers: Crompton & Co., Macfarlane and Burge [Dynamos and motors] 824/10; Siemens Bros. Dynamo Works, Kieffer and Schaeffer [Ventilation of machines] 5,117/10; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Motor control] 13,521/10; Siemens Bros. Dynamo Works and Kieffer [Ventilation of machines] 19,164/10.

Electric Ignition: Chapman [Battery and commutator for starting engines with magneto ignition] 23,319/09; Thompson (*Ernst Eisemann & Co. Ges.*) [Control of ignition period] 9,488/10.

Electrometallurgy and Electrochemistry: Johnson (*Chemische Fabrik Griesheim-Elektron*) [Purification of magnesium] 23,439/09; Hartman [Electrical purification of liquids] 28,552/09.

Incandescent Lamps: Damey, 22,823/09; Ruhstrat [Manufacture of metal filaments] 24,437/09; Westinghouse Metallfaden-Glühlampenfabrik Ges. [Decarbonising of metal filaments] 2,983/10, and [Manufacture of tungsten filaments] 3,610/10; Urbain, Feige and Seal [Electric lamp] 4,098/10.

Instruments and Meters: Armour [Indicating and recording pyrometers] 22,764/09.

Storage Batteries: Taylor [Charging systems] 22,518/09.

Switchgear, Fuses and Fittings: Damey [Lamp-holders] 22,823/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Voltage regulation of A.-C. systems] 23,415/09; Hirsch [Switches] 10,474/10; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [A.-C. electromagnets] 11,614/10.

Telephony and Telegraphy: British Radio Telegraph & Telephone Co. and Balsillie [Wireless telegraphy and telephony] 22,930/09; Clarke [Telephone mouthpieces] 30,352/09; Petersen and Sem [Long-distance telephony] 6,895/10; Widegren and Widegren [Control of telegraph apparatus from a distance] 13,991/10.

Traction: Unverricht [Safety devices] 19,265/10.

Miscellaneous: Dobson and Henry Pooley & Son, Ltd. [Electrically indicating weighing machines] 22,539/09; Bouchard-Praceiq [Wave-motion generating plant] 22,725/09; Boult (*Electric Meat Curing Co.*) [Preserving process] 23,059/09; Callender's Cable & Construction Co., and Petersen [Combined cable-drum and jointers' cart] 23,307/09; Schnorrenberg [Operating gas-valves from a distance] 26,217/09; Bumiller [Lighting Christmas trees] 5,127/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: Riese, 22,517/10.

Electrometallurgy: Langbein-Pfanhauser-Werke A.G. [Manufacture of sheets and wire of electrolytic iron] 22,204/10.

Switchgear, &c.: Smith and Larsen [Controllers] 15,343/10; Forsberg [Electromagnetic device] 22,394/10; Case [Motor control] 22,708/10; Milch [Regulating apparatus for induction motors] 22,717/10.

Traction: Westinghouse [Air-brake joints] 21,558/10.

The following amended Specifications can now be obtained.

Schwarz [Exhaust steam plant] 3,881/08; Michaud and Delasson [Filaments of refractory oxides] 8,104/08; Thompson (*Ges. für Drahtlose Telegraphie*) [Wireless oscillation generator] 6,424/09; Rausch [Electric time alarm] 12,195/09.

Application for Restoration of Lapsed Patents

7,526-7/04. **Petrol-Electric Systems.** H. Pieper. The Société Anonyme L'Auto-Mixte has applied for the restoration of these two patents, which expired on March 30th, 1910, owing to non-payment of the renewal fees. Notice of opposition must be given before December 19th, 1910. The first patent covers the employment, in petrol-electric drive, of a single lever or pedal controlling the starting and speed control switchgear, and mechanically connected to the air-valve of the carburetter and the ignition control lever. In an alternative arrangement, a separate lever controls the starting resistances only. The second patent covers a solenoid for automatically regulating the petrol supply. It has two windings, one in shunt, and one in series with the battery, and they assist each other when the battery is being charged.

Application for Extension of Term.

11,575/97. **Wireless Telegraphy.** O. J. Lodge. The Lodge-Muirhead Wireless Co. will shortly apply for an extension of the term of this patent. (See another page of this issue.)

Opposition to Grant of Patent

27,458/09. **Automatic Telephone Exchanges.** Siemens Bros. & Co., Ltd. (*Siemens & Halske A.-G.*). Opposition has been entered to the grant of this patent. It relates to an automatic exchange, in which the subscribers' lines are subdivided into groups, and the line of a calling subscriber is connected automatically with a disengaged first group selector by means of a step-by-step switching mechanism. According to this invention, this switch co-operates with a second step-by-step switch in such a manner that a subscriber's line is connected with a disengaged group selector over both switches, so that a larger number of the first group selectors common to several groups are available for each calling subscriber owing to the two-fold automatic selection.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: Allgemeine Elektricitäts-Ges. [A.-C. commutator motors on D.-C. circuits] 13,706/05.

Electrometallurgy and Electrochemistry: E. Andreoli [Ozone generator] 15,813/97; C. A. Keller [Electric smelting furnace] 24,234/01; W. T. Mercier [Treatment of flour] 14,757/03.

Instruments, &c.: Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Induction motor meters] 13,981/99; C. G. Garrard and Ferranti, Ltd. [Induction motor meters] 15,290/04.

Switchgear, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Fuse boxes] 13,974/05; and [Detectors for indicating live H.-T. wires] 13,976/05.

Traction: G. Hardingham (*Felten & Guilleaume Carlswerk A.-G.*) [Rail bonds] 15,119/02; E. A. Stanley and T. F. Thomson [Tramcar bodies] 14,906/04.

Miscellaneous: B. P. Haigh [Marine steering gear] 13,856/05.

Digitized by Google

LOCAL NOTES

Bath: *Electric Lighting Order Extended.*—The Corporation have been granted a provisional order authorising them to supply electrical energy in a larger area, having a radius of three miles from the Guildhall.

Bingley: *Electric Supply.*—The District Council, which is contemplating an electric supply scheme, have decided to apply to the Board of Trade for an Order depriving the Yorkshire Electric Power Co. of their powers to supply electrical energy in the district. The Power Company have had these powers for some years, but have not yet put them into force.

Bognor: *Electric Supply.*—In consequence of the Chichester Electric Light & Power Co. having intimated its intention of applying to the Board of Trade for an electric lighting provisional order, the Council have called in a consulting engineer who reports in favour of the Council carrying out the work itself. A special meeting is to be held to consider the expediency of the Council applying for a provisional order.

Bradford: *Electricity Accounts.*—The net profit from the electricity undertaking for the year to March 31st was £7,399. The number of units sold for bulk supply, power, and heating increased by 1,164,497 units, and the increased revenue of the undertaking during the year is entirely derived from these supplies.

Brighton: *Proposed Worthing Tramways.*—The General Purposes Committee will recommend at to-day's meeting of the Council that the proposal of the British Electric Traction Co. to construct a system of tramways in connection with Worthing, should be rejected, but it is understood that several members on the Council favour the idea, and that an amendment approving the proposal will be moved.

British Columbia: *Electric Traction Development.*—The British Columbia Electric Railway Co. have recently opened a new line between New Westminster and Chilliwack, a distance of 64 miles. Electric traction on this railway substitutes steam traction.

Bushey: *Trolley Omnibuses.*—The Committee, who, in conjunction with four representatives of the Watford Urban District Council, visited the Continent to inspect various systems of trolley omnibuses, presented its report at the last meeting of the Council. The report recommends the Council to pass a resolution approving the principle of railless traction, and that subject to certain conditions, the Council should agree to support any application which the Hertfordshire County Council may make for powers to work a service of cars on this system in the Bushey district. After discussion it was decided to postpone any action until after a conference with the County Council.

Carnoustie: *Provisional Order Revoked.*—The Board of Trade have revoked the electric lighting Provisional Order granted to the Council in 1902.

Greenock: *Power Supply.*—The question of the Council supplying electrical energy in Port Glasgow has advanced a stage. A meeting of power users in Port Glasgow will be held shortly, and afterwards Mr. J. A. Robertson, the Borough Electrical Engineer, will report to his Council.

Heywood: *Tramway Accounts.*—The tramway accounts for the year to March 31st show a deficiency of £1,188 after meeting capital charges. The General Manager points out that the interest and sinking fund charges on the award to the old Tramway Company practically accounts for the whole loss. The number of passengers carried was 2,181,751, against 2,291,147 in the previous year.

Hull: *Tramways Assessment.*—The assessable value of the Tramways Committee's property in Sculcoates has been increased by £4,574, and the rateable value by £3,473, and an appeal is to be made.

Kingston-on-Thames: *Electricity Accounts.*—In his report upon the electricity undertaking for the past year, when a loss of £1,644 was incurred, Mr. J. E. Edgcome, the Borough Electrical Engineer, attributed it to the use of metal filament lamps, the lighting load at Kingston being nine-tenths of the whole. He believes, however, that the lowest point of this set-back has now been reached, as indications point to an appreciable increase in revenue from the new consumers now being connected.

Launceston: *Provisional Order Revoked.*—The Board of Trade have revoked the electric lighting Provisional Order granted to the Council in 1903.

London: *London County Council: Tramways.*—The Highways Committee recommend that the assembly, fitting, and testing of the car ploughs required for 250 additional electric tramcars be carried out by direct labour.

At the ordinary weekly meeting of the Council on Tuesday the recommendations of the Highways Committee to apply to Parliament for powers for new tramways next session was discussed. The proposals, which have already been given in ELECTRICAL ENGINEERING, involve an expenditure for construction and equipment of £832,040, whilst street improvements will cost £346,860. In the discussion Sir John Benn complained that the Highways Committee were not going on to work expeditiously enough with the tramways, and pointed out that whereas Glasgow carried its entire population 222 times in the year, Manchester 172 times, and Sheffield 165 times, in London the population was only carried 86 times. Mr. Hayes Fisher, M.P., referred to the disadvantage which the Council were suffering under by reason of the veto given to the London Borough Councils, and suggested that a conference should be held to discuss this matter. The report of the Committee was eventually adopted.

City of London: New St. Paul's Bridge.—The proposal to construct a new bridge over the Thames, commencing near St. Paul's Cathedral, at an estimated cost of £1,646,983, was adopted at the City Corporation meeting on Thursday. During the discussion upon it, the terms proposed by the London County Council for the construction of tramways over the new bridge were commented upon in severe terms. As the matter at present stands, the City Corporation threaten to proceed with the scheme for the construction of the bridge, and bar the running of tramways over it.

Menston (Yorks.): *Electric Lighting.*—A Company is being formed for erecting a generating station.

Newark: *Electric Supply.*—As certain firms desire to set up works in Newark, but are prevented from doing so owing to lack of a supply of electricity, the Council are endeavouring to make arrangements with a Company to work the Council's existing electric lighting provisional order.

Ogmore: *Proposed Tramways.*—It is proposed to hold a conference of the Ogmore, Maesteg, Bridgend, and some other neighbouring Councils with a view to preparing a joint tramway scheme.

Preston: *Tramway Accounts.*—The report and accounts of the Corporation Tramways Department for the year to March 31st show a net profit of £3,994, after meeting capital charges, all of which is transferred to reserve fund. The revenue per car mile was 10d., against 9·95d. last year, whilst the working expenses were 6·16d., compared with 6·09d.

Southend: *Street Lighting.*—The Highways Committee have adopted a scheme of public lighting, which provides for fixing 100 c.p. lamps on the traction poles.

Sunderland: *Electric Power at a Shipyard.*—The electricity department have arranged for a supply to the shipyard of Messrs. J. L. Thompson & Sons for driving a 280-h.p. motor, which is being installed to take the place of a Diesel engine.

Wakefield: *Electricity Accounts.*—There was a loss of £802 upon the working of the electricity undertaking for last year. The Borough Electrical Engineer says the bulk of this is attributable to the use of metal filament lamps.

Worthing: *Position of Electricity Undertaking.*—As the result of certain statements recently made by some members of the Council regarding the position of the electricity undertaking, Mr. G. Porter, the Council's Electrical Engineer, has written stating that these statements are derogatory to his professional reputation in the highest degree, and demands a full inquiry at the hands of an independent expert. The statements in question allege gross mismanagement, although not directly against Mr. Porter or the Committee. The Electricity Committee state that any such allegation is entirely without foundation, and it will be left to the Council to decide whether an inquiry shall be held. Notice of a motion has been given suggesting the engagement of an engineer to make an exhaustive survey of, and full report upon, the electrical undertaking, and its management, and that a special committee should be appointed to deal with the matter.

Proposed Tramways.—The British Electric Traction Co. are putting forward a scheme for constructing tramways from Worthing and through Portslade to Hove. Inter-communication with the Brighton Corporation tramways is proposed.

Digitized by Google

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Accrington.—An inquiry was held last week concerning a loan of £16,041, mainly for the supply of Haslingden. Mr. C. D. Taite, Chief Engineer of the Lancashire Electric Power Co., was present in order to oppose, as Haslingden is within their area of supply, but their tender was not so advantageous as that of Accrington. Mr. H. R. Hooper, the Inspector, held that the company had no *locus standi*.

Argentine.—An electric power-station is to be erected in connection with some large extensions of the military port near Bahia Blanca.

Austria-Hungary.—A loan of £725,000 is to be taken up by the Town Council of Reichenberg for various public works, including an electric power-station and tramways.

Birmingham.—A Local Government Board inquiry was held last week concerning a loan of £143,250, for the purposes of the electric supply undertaking. Of this sum £129,450 are required for the Summer Lane power station, and £13,800 for sub-stations. It is expected that this sum will suffice for three or four years, but it does not take into account the possible development should the scheme for extending the boundaries of Birmingham be passed. The proposed extensions will bring the capacity of the Summer Lane power station to 31,500 kw., and in addition there is generating plant of the capacity of 2,000 kw. at the Water Lane power-house. The present capacity is 15,260 kw.

Brazil.—A scheme for the conversion to electric traction of the Victoria-Diamantina Railway has been approved. The cost of conversion is estimated at about £3,950,000.

Edinburgh.—The Electric Lighting Committee recommend the acceptance of estimates amounting to £14,000, in connection with the installation of three cooling towers at Dewar Place power-station.

Gillingham.—A Local Government Board inquiry was held on Saturday concerning a loan of £3,500 for additional plant and mains.

Hayti.—A concession has been granted for a railway from Port-au-Prince to Pétion-Ville. Interest on the cost of construction, amounting to about £44,600, is guaranteed by the Government.

London: *Islington.*—A loan of £19,365 has been granted by the L.C.C. for electrical extensions.

Southwark.—A loan of £1,830 has been granted by the L.C.C. for electrical extensions.

Woolwich.—A loan of £5,285 has been granted by the L.C.C. for electrical extensions.

New Zealand.—The New Zealand Government propose to borrow £50,000 per annum for a number of years in order to develop the water power sources of the country for generating electrical energy. If the proposal is sanctioned, one scheme will be developed in the North Island, and one in the South Island to begin with.

Oldham.—The Borough Electrical Engineer has prepared a long report upon the electricity undertaking, in which he points out the need of further extensions. A mixed pressure turbo-generator is suggested, whilst additions to the mains and switchboards are also proposed with the object of generating all energy in future at the Greenhill power station.

Pembroke.—A loan of £14,000 has been sanctioned for electrical extensions.

Peterborough.—The Electricity Committee require 4,716 yards of distributor cables. Particulars from the City Electrical Engineer, and tenders by November 3rd.

Sheffield.—Tenders are invited for roof principals and supports for extensions to Neepsend power station. Particulars from Mr. S. E. Fedden, and tenders by November 22nd. (See an advertisement on another page.)

Southend.—A loan of £17,859 is to be applied for to meet the expenditure on a new battery storage room, and the supply of electricity to the extreme eastern and western portions of the borough.

South Wales.—The South Wales Electrical Power Distribution Co. have been granted permission to carry overhead wires through Llanbradach for street lighting purposes.

Warrington.—The Electricity Department require a twelve months' supply of motors and transformers. Particulars from the Borough Electrical Engineer, and tenders by November 15th.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Re-arrangement of Reception Hall, Basement, &c., Clarendon Restaurant, Broadway, Hammersmith.

County Skating Rink, Plumstead Road, Woolwich.

Cinematograph Chamber and installation of motor-generator at Holloway Empire.

Installation of electric lighting, motor-generator, and electric radiators at Mitcham Lane Picture Palace, 127 Mitcham Lane, Streatham.

Holy Trinity Church Hall, Rotherhithe.

Proposed Coliseum in High Road, Kilburn. Messrs. F. Matcham & Co.

Additions to Edmonton Co-operative Society's building, 156 Stoke Newington Road.

PROVINCES.

Ayr.—New school.—New Library Club premises.

Belfast.—Baths at Ligoniel. Architect, Mr. S. C. Hunter, Scottish Provident Buildings, Wellington Place.

Birkenhead.—Extension to Nurses' Home. Architects, Messrs. E. Kirby & Sons, 5 Cook Street, Liverpool.

Brentford.—Additions to Workhouse buildings.

Brighton.—Winter Garden on Palace Pier, and alteration to Electric Theatre and Restaurant.

Chester.—City and County School in Queen's Park.

Clydebank.—Model Lodging House at McArthur Street, Yoker. Builder, Mr. H. Nicol, Hamilton.

Coatbridge.—Additions to Clifton Model Lodging House.

Croydon.—Eight Houses. W. Darnell, Balham.—Conversion of shop to electric theatre, London Road. S. Marsland, 19 Tylecroft Road.

Darwen.—Proposed school at Spring Bank.

Doncaster.—One hundred and forty houses. Town Council.

Dublin.—Police barracks and station at Fitzgibbon Street. Office of Public Works, Dublin.

Eastbourne.—New Post Office. H.M. Office of Works, London.

Halifax.—Church of St. Matthew, Northowram.

Leeds.—Enlargement of Head Post Office. H.M. Office of Works, London.

Liverpool.—Extensions to Engineering Laboratory at University.

Lowestoft.—Drill Hall in Beccles Road for Suffolk Territorial Force Association. Architect, Mr. F. W. Richards, 14 Stanley Street.

Manchester.—New Elementary School. Architect, Mr. H. Littler, 16 Ribblesdale Place, Preston.

Convalescent Ward Pavilion at Monsoll Hospital.

Redruth.—New bottling department at the Redruth Brewery.

Rhondda.—New school at Ynyswen. Town Clerk.

Torquay.—Municipal buildings, New Town Hall and Pavilion.

West Bromwich.—Proposal to erect Sanatorium for Midland Local Authorities. Association of Midland Local Authorities.

MISCELLANEOUS

Argentine.—The Government of the Province of Salta have granted a concession to Mr. E. Barvil for electric tramways.

Beckenham.—The lighting of the Shortlands district has been referred to the Electricity Committee for consideration.

Bradford.—The Tramways Department require stores during the coming year, including lamp fittings, tractor lamps, insulating material, &c. Particulars from the Manager, and tenders by November 12th.

Canada.—A proposal has been made to extend the electric tramways system in Toronto. New lines to the length of 10 miles are suggested, at an estimated cost of £154,000. Particulars can be obtained from the Board of Trade, 73 Basinghall Street, London, E.C.

Faversham.—A small street lighting scheme is under consideration.

TENDERS RECEIVED AND ACCEPTED

Argentine.—The Colon (Buenos Aires) Municipality have received two tenders for the erection of an electric power station.

The tender of Messrs. Casella & Salvetti has been accepted for the erection of an electric light station at Maipú (Buenos Aires).

The Santa Fé Municipality have signed a contract with Messrs. Winby & Co. for the electrification of the tramways, and the construction of power-house.

Chelmsford.—The tender of the Electrical & Motor Co., of

Digitized by Google

Banbury, has been accepted for the electric lighting of the Trinity Road School at £156.

Johannesburg.—The British General Electric Co., Johannesburg, have recently secured a contract for 4,000 Osram lamps, which are to be used for the entire equipment of the incandescent street lighting scheme adopted by the Johannesburg Municipality. The General Electric Co. inform us that this selection was made after very severe and lengthy tests of all the best-known makes of lamps, the Osram having been adopted exclusively for the purpose named.

Ireland.—An order has been placed with Messrs. Mirrlees, Bickerton & Day, Ltd., for the supply to the Curragh Military Camp, of three Diesel oil engines coupled to 55 kw. generators.

Leatherhead.—Messrs. Siemens Bros. Dynamo Works, Ltd., have secured a maintenance contract for the ensuing twelve months for "Onewatt" high c.p. lamps for street lighting for Leatherhead and district.

London: *London County Council.*—Messrs. Kirk & Randall are to be allowed to sublet to the Lahmeyer Electrical Co., Ltd., or the Forest City Electrical Co., the copper bonds required in connection with the alteration of the existing tramways in Highgate Road.

The Highways Committee recommend that the horse tramways running from Holloway Road to the Angel, Islington, via Liverpool Road, should be abandoned, and the lines taken up. Their reason for this is that the lines being to a large extent parallel with the existing electric tramways to Islington via Highbury, the extra traffic likely to be carried would not justify the large expenditure involved.

The following tenders have been received for the electric lighting of school buildings now in course of construction in Hoxton:—F. Troy & Co., £615; E. Morgan, £708; Tilley Bros., £738; Johnson & Phillips, Ltd., £870; G. Weston & Sons, Ltd., £895 10s.; E. Newbald & Co., £934; Central Motor Engineering Co., £1,041 4s.; E. Lawrance & Sons, Ltd., £1,147 18s.

Battersea.—The Foster Engineering Co., Ltd., have obtained the order for Arding & Hobbs for 60 Brockie-Pell B.E.M. type enclosed lamps. The lamps have to burn two in series on 230 volts direct.

Hackney.—The following tenders were received for a supply of white open-type arc lamp carbons:—The Radium Electric Co., £9 8s. 6d. and £7 17s. 9d. per 1,000 pairs; Siemens Bros. Dynamo Works, Ltd., £6 8s. and £5 7s.; General Electric Co., Ltd., £4 10s. 6d. and £3 8s. 9d.; British Westinghouse Co., Ltd., £4 5s. 6d. and £3 11s. 6d.; Crompton & Co., Ltd., £3 16s. and £3 3s. 6d.; Johnson & Phillips, Ltd., £3 16s. and £3 3s. 4d.; H. G. Mayer & Co., £3 15s. 3d. and £3 2s. 10d.; Electrocarbon A.G., £3 16s. and £2 16s.; Sloan Electrical Co., Ltd., £3 8s. 5d. and £2 17s. 2d.; W. Geipel & Co., £3 8s. 3d. and £2 15s.; and Ship Carbons, Ltd., £3 6s. 11d. and £2 15s. 10d. The last tender is recommended for acceptance.

Mountain Ash.—The following tenders for a year's supply of electrical stores have been accepted:—Single-phase meters, auto-transformers, &c., British Westinghouse Co., Ltd.; single-phase meters, Ferranti, Ltd.; metal filament lamps, The General Electric Co., Ltd., and Cryselco, Ltd.; vulcanised cable, Liverpool Electric Cable Co.; flexible wire and lamp holders, the General Electric Co., Ltd.

Southend.—The tender of the Chloride Electrical Storage Co., Ltd., has been accepted for a new storage battery at £3,861.

Overhead v. Underground Telephone Wires.—At the Barnet County Court on Tuesday last week, a dispute was heard between the Finchley Urban District Council and the Postmaster General with regard to the installation of telephone wires in five streets. The Postmaster General wished to put up overhead wires at a cost of about £53, whilst the District Council desired that the wires should be placed underground, which it was stated would cost £335. The roads in question are all branch roads, from the point of view of telephones, and it has been the policy of the Postmaster General to deal with these by means of overhead wires branching off the main roads where the underground mains are laid. As a justification for this policy it was pointed out that in Finchley 77½ per cent. of the cost of a telephone installation is represented by the outside work, the remainder being in respect of the construction. In Finchley, no less than £47,000 have been spent on underground work, and only £738 on overhead work, and the doubtful possibility of an increase in the number of subscribers does not warrant the Postmaster General putting in further underground wires. The case against the proposition was that the overhead wires would run through residential estates, and that all the occupiers had protested against their use. The poles would be 24 feet high and 70 yards apart. The decision was reserved.

APPOINTMENTS AND PERSONAL NOTES

Mr. G. Basil Barham, who has been for a short time engaged upon other work for his firm, has again taken over the management of the Publicity Department of the Edison & Swan United Electric Light Co., Ltd.

Mr. Alexander Gray has been appointed Assistant Professor of Electrical Engineering at the M'Gill University, Montreal. Mr. Gray, who is a native of Edinburgh, has for several years been on the staff of the Allis-Chalmers Co. in America.

The salary of Mr. John Senior, Borough Electrical Engineer at Mexborough, has been increased from £200 to £250 per annum.

The late Mr. E. Clapham, a director of the City of Buenos Aires Tramways Co. (1904), Ltd., left estate valued at £112,109, with net personalty £111,825.

Mr. W. R. Watt, of the Aberdeen Corporation Electricity Department, has secured an important post upon the staff of the Electric & Ordnance Accessories Co., Ltd., Birmingham.

An engineering canvasser, salary £156 per annum, and a showrooms attendant, salary £91, are required at Bristol. (See an advertisement on another page.)

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 5s. per ton (last week, £59 5s. to £59 10s.).

Bankruptcies.—J. W. Barnett, trading as Barnett & Hyde, 25 Waterloo Road, Burslem, electrical engineer, has been adjudicated bankrupt. The unsecured liabilities amount to £531, and the estimated net assets to £70. The trustee is Mr. R. E. Clark, chartered accountant, Hanley.

Exhibition Award.—Messrs. R. Wolf, of Magdeburg-Buchan, have been awarded a Grand Prix at the Centenarian Exhibition at Buenos Ayres for their exhibit of locomobiles, which were at work producing a considerable share of the electrical energy for the exhibition.

Reduced Prices of Carbon Lamps.—Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston, London, N.E.), inform us that they have recently reduced their prices for carbon filament lamps to the trade, and will be pleased to quote higher discounts than formerly. Large stocks of these lamps are held.

Electrical Exhibition.—An electrical exhibition is to be held in Belfast. (See an advertisement on another page.)

Water-power in Sweden.—The *Board of Trade Journal* gives the following particulars from an official report on the Swedish waterfalls:—The total water-power in Sweden is estimated at approximately 10,000,000 h.p., available during from six to nine months of the year, and 2,500,000 h.p. available during the time of low water. Of this amount 75 per cent. is in North Sweden, 15 per cent. in the province of Svealand, and 10 per cent. in Göteland. In the near future 600,000 h.p. will be in use, including 340,000 h.p. for the generation of electrical energy. At the present time the State possesses, or is part proprietor of, waterfalls of about 880,000 h.p. Only 63,000 h.p. is now in use by the State, including some 40,000 h.p. at the power station at the Trollhättan falls. Work is now in progress at Trollhättan by which a further 40,000 h.p. may be used there. At the great Porjus fall on the Lulea river, in Lapland, a power station is to be erected with a capacity of 50,000 h.p. In addition, the Swedish Government proposes to set up works at Alfkarleby, in Upsala län, Uppland, and at other places. Preparations are in hand with a view to utilising the waters of Lake Waner and Lake Siljan. The Government is also turning its attention to the use of the water-power in the centre and south of Sweden for providing power for the electric railways, and has to this end purchased waterfalls at a cost of about £280,000. If the electrification of the line on the northern Swedish boundary proves satisfactory, electric traction will be extended eventually to the whole of the State railways. The falls in the upper Lulea river are to be rendered accessible by the construction of a railway from Gellivare to Porjus, and the Trollhättan canal also is being made capable of taking vessels drawing 13 ft. to 16½ ft. The present law as to the right of disposal of waterfalls is stated to be unsatisfactory, and the Waterfalls Commission is preparing a draft for a more suitable law.

OSRAM LAMPS

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

J. G. White & Co.—An extraordinary general meeting was held on Thursday to consider a proposal to divide the existing preferred £10 shares into 10 shares of £1 each. The proposal was only put forward to test the feeling of the shareholders, as some opinions were held that the £1 share would be more readily saleable, but on being put to the meeting the resolution was lost.

Rosario Electric Co.—The accounts for the year to June 30th show a sum of £53,582 available. A final dividend of 8 per cent. per annum is proposed on the ordinary shares, £25,000 being added to reserve, and £9,306 carried forward. The Société Financière de Transports et d'Entreprises Industrielles (of Brussels) has acquired the bulk of the shares of the Company under the agreement entered into early this year, and the Société d'Electricité de Rosario has now been formed to take over the undertaking. The Company is open until December 31st to purchase the remaining shares of the Company.

At the annual meeting on Tuesday the report and accounts were adopted.

Montreal Light, Heat, & Power Co.—A dividend at the rate of 7 per cent. per annum is declared for the three months to October 31st.

Companies Struck off Register.—The names of the following have been struck off the register of joint stock companies, and are declared dissolved :—Dorchester Electric Light & Power Co., Electrical Vehicles Development Co., Macclesfield Tramways Syndicate, Newark Electric Supply Co., and Railway & Tramway Concessions Syndicate.

Cleveland & Durham Electric Power Co.—At a special meeting on Tuesday, the proposals to reduce the capital of this company referred to in our last issue were adopted.

Metallic Seamless Tube Co.—There was a net profit of £1,640 for the year to June 30th, in addition to which £4,157 was brought forward. A dividend of 5 per cent. is recommended, carrying forward £4,572.

Auckland Electric Tramways Co.—The accounts for the year to June 30th, after setting aside £7,500, show a surplus of £24,100. £6,000 are placed to reserve, a 6 per cent. dividend declared on the ordinary shares, and £6,100 carried forward.

Drake & Gorham.—At the annual meeting on Tuesday the report and accounts were adopted. Mr. Bernard Drake, who presided, referred to the large number of private installations carried out during the year. The trade department of the company increased its turnover by 50 per cent., and it has been necessary to take additional stores to cope with this business.

Lima Light, Power & Tramways Co.—An issue of £1,200,000 5½ per cent. first mortgage debentures at 97 have been offered during the week. This company has recently been formed to take over and work a number of electric railway, tramway, water-power, and lighting undertakings, as well as the lease of the Lima Railway Co.

Ferranti.—There was a trading profit for the past year of £31,236, compared with £29,218 in the previous year. Depreciation is allowed for to the extent of £7,500 against £5,000, and after wiping out the adverse balance, a sum of £1,161 is carried forward.

Clyde Valley Electrical Power Co.—At the half-yearly meeting on Friday, Mr. A. Bonar Law, M.P., the chairman, drew particular attention to the rapid progress which this company is making. For the six months to June 30th there was a profit of £10,519, which is within a few hundred pounds of the profit of the whole of 1909, whilst in 1908 the loss was £1,149. A new 5,000-kw. turbo-alternator is now nearly completed, bringing the capacity of the two power houses at Yoker and Motherwell to 18,000 kw.

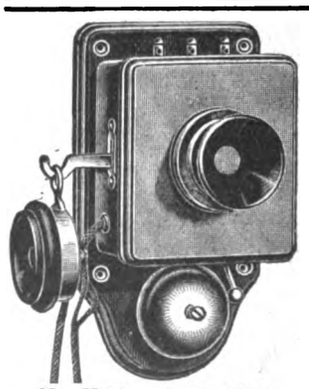
New Aluminium Alloy.—In the course of his presidential address to the South Staffordshire Iron and Steel Institute on October 15th. Mr. W. Macfarlane referred to the new alloy "Duralumin." It contained over 90 per cent. of aluminium, and its specific gravity varied between 2·77 and 2·84, but in tensile strength and elongation it was as good as mild steel. It was not recommended for castings, but could be forged, rolled, and drawn. The alloy took a high polish, withstood atmospheric influences, and was non-magnetic. Its present high cost, however, stood in the way of its extensive adoption. Referring to electric furnaces, Mr. Macfarlane pointed out that a furnace in which a high temperature could be easily controlled and maintained without introducing impurities, and which did not tend to oxidise the product, had much in its favour. It might be premature to speak of its prospects for smelting, but for refining it had ample scope. In Sheffield, electric furnaces were making high-class tool steel, and were working in conjunction with open-hearth plant. Fluid dephosphorised metal was transferred to the electric furnace, and was there desulphurised and deoxidised. In the preparation of ferro alloys the electric furnace must take a foremost place. It was the ideal furnace for the production of aluminium.

NEW COMPANIES

BRUSSELS IMPROVEMENTS (1910).—Registered by Ashurst, Morris, Crisp & Co., 17 Throgmorton Avenue, London. Capital, £10,000. To construct railways, tramways, electric light, telephone, telegraph and power supply works, &c.

PERRY & LAWSON.—Prudential Buildings, Market Place, Wednesbury. Capital £1,000. Manufacturers of and dealers in electrical apparatus.

NEW DEVELOPMENT CO.—Bedford Circus, Exeter. Capital £5,000. To promote and finance companies, syndicates, &c., in carrying on electric light or electrical undertakings. The subscribers are W. Allnutt, Hamilton House, Victoria Embankment, London, and E. H. Reeves, Salisbury House, London, E.C.



New Foundry Journal.—We have received a copy of the first number of the European edition of *Castings*, a monthly illustrated journal of American origin devoted to foundry practice, and issued by Page's Publishing Co., Ltd., London. The contents include a description of a foundry especially designed for motor-car work, a paper on the testing of metals, an article on metal pattern making, a paper on the cost of steel manufacture in foundries, and various short notes and articles of interest to pattern-shop and foundry men.

SUMMARY

OUR monthly supplement on Electrical Engineering in Mines is included in this issue. It opens with a critical article on the Association of Mining Electrical Engineers, and contains an illustrated description of the electrical equipment of the Oakdale Collieries. Notes are given on mining electrical patents of interest published during September. We are able to publish a report of one of the branch discussions of the Association of Mining Electrical Engineers. The causes of some recent electrical accidents are also dealt with.

BRITISH incandescent lamp manufacturers have been approached with a request to pay royalties to the owners of two patents relating to the manufacture of lamp caps with glass or "Vitrite" fillings. It appears that a company formed for the purpose have purchased a British patent taken out in 1902 by Mr. A. Swan, of the General Electric Co., of America, describing a process and machines for manufacturing such caps, and contend that the manufacture and sale of them is an infringement of their rights. We understand that the British manufacturers will unitedly oppose the demands of the company, and will indemnify their customers in respect of any action for infringement. (Page 695.)

MR. ALEXANDER SIEMENS delivered his Presidential Address to the Institution of Civil Engineers last Tuesday, and dealt with a number of aspects of engineering matters. (Page 696.)

THE Presidential address of Mr. J. S. Peck to the Manchester section of the Institution of Electrical Engineers took the form of a review of recent electrical progress in America, and a consideration of some differences in the conditions obtaining here and in the United States. (Page 696.)

A FEW notes are given on the work of the Exhibition Branch of the Board of Trade in assisting British firms participating in International Exhibitions. (Page 697.)

ELABORATE arrangements are being made for the lighting of the new Palladium Theatre of Varieties, for which special fittings have been designed. (Page 697.)

WE publish an article dealing with the meetings of the Institution of Electrical Engineers, and also of the Local Sections during the coming Session. (Page 697.)

THE arbitration regarding the price of the current for the tramways in Paisley was concluded in London on Thursday, and Mr. Robert Hammond, the arbitrator, is now considering his award. This will be awaited with interest, as the arguments employed on both sides are to some extent applicable to a large number of other cases where similar cases are pending. (Page 698.)

ATTENTION is called to recent articles in the American press indicating the progress which has been made in the adoption of electric vehicles in that country. (Page 699.)

OWING to the resignation of Mr. J. H. Rider, Chief Electrical Engineer of the L.C.C. Tramways Department, a rearrangement of the staff has been made, involving the abolition of this post and the appointment of a Deputy Chief Officer and an Electrical Assistant. (Page 699.)

A SHORT article refers to an exhibt of rubber-preparing plant shown at the Brussels Exhibition. (Page 699.)

AMONG the Specifications published by the Patent Office on Thursday was one by C. Damey for a locking lamp-holder and cap, in which spring plungers in the cap enter holes in the holder. Two patents by A. E. Angold and T. L. Carbone respectively relate to enclosed flame arc lamps with special cooling chambers in which the fumes are deposited. The Westinghouse Metallfaden-Glühlampenfabrik Ges. cover processes for the manufacture and decarbonising of tungsten fila-

Digitized by Google

ments. An arrangement of microphones for long-distance telephony is claimed by A. Petersen and G. Sem.—The patent recently refused to B. Seacombe for a magneto massage machine has now been granted with certain amendments. Opposition has been entered to the grant of a patent for a vacuum cleaner.—A patent by the Babcock & Wilcox Co. for a sectional water-tube boiler expires during the current week after the full life of fourteen years. (Page 700.)

Bournemouth Council have decided to abandon the conduit system.—The price for tramway energy at Brighton has been reduced from 1·35d. to 1·2d. per unit.—Eccles Council are making the experiment of supplying electricity to a block of cottages at 6d. per week.—A competitive scheme of street lighting by gas and electricity is to be carried out in Gower Street.—The Board of Trade have renewed the licence for the Dolter system in Torquay, pending the conversion to the overhead system.—The Acton ratepayers are endeavouring to prevent the sale of the electricity undertaking to the Metropolitan Electric Supply Co. (Page 701.)

Loans have been sanctioned at Barking (£11,000); Peterborough (£2,000); and Portsmouth (£20,586). Mains are to be extended at Stoke-on-Trent (£1,000), and extensions are contemplated at Greenock (£16,000) and Gloucester (£14,000). The Portrush Council propose to erect an electric power station, and generating plant is to be installed at the Sittingbourne paper mills. (Page 701.)

At the statutory meeting of "Metalite, Ltd." last week, it was stated that new works are to be erected at Derby. It was said that orders for 980,000 lamps have had to be refused.—The accounts of the Edison & Swan United Electric Light Co. for the year to June 30th show a loss of £3,184. (Page 704.)

ARRANGEMENTS FOR THE WEEK

TUESDAY, NOVEMBER 8th.

National Electrical Manufacturers Association.

2.30 p.m. Committee meeting at Balfour House, Finsbury Pavement, E.C.

Institution of Electrical Engineers, Manchester Section.

7.30 p.m. At University. "Irregularities in the Rotating Field of the Polyphase Induction Motor," by C. F. Smith.

Institution of Electrical Engineers, Glasgow Section.

8 p.m. At 207 Bath Street. Address by Mr. Sam Mavor.

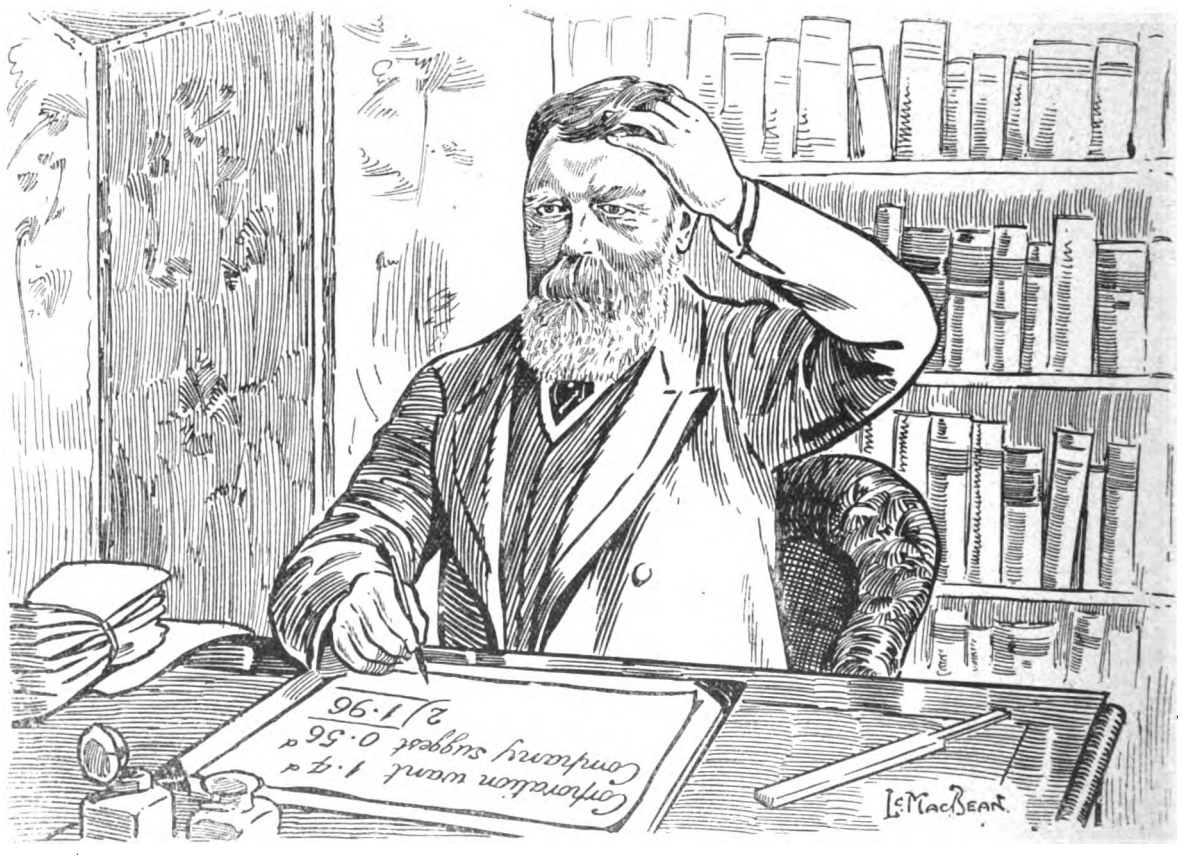
Institution of Civil Engineers.

8 p.m. At 25 Great George Street, Westminster. "The London County Council Holborn to Strand Improvement, and Tramway Subway," by G. W. Humphreys.

THURSDAY, NOVEMBER 10th.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. Presentation of scholarships and premiums, and inaugural address of the President, Mr. S. Z. de Ferranti.



ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to The Editor, Electrical Engineering, 203-6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.

Answer to Several Wiring Contractors.—You will find the explanation of the letter which you have received given in an article on another page.

L. Heward.—Other metals than platinum have been employed for the leading-in wires, but we believe that all or nearly all the lamp manufacturers still employ a short-length platinum for passing through the glass, jointed to wires of less expensive metal at both ends. In a recent patent process, however, very thin copper strips have been employed with, it is said, good results, and another inventor has suggested a method of employing iron wires.

R. Jenner, Jr.—The lamps are connected in series-multiple.

Mr. Robert Hammond, who has been sitting as arbitrator to determine the price per unit that the Paisley District Tramways Co. should pay the Corporation for electrical energy, is considering his award. **(See page 298.)**

Mr. ROBERT HAMMOND (*to himself*)—**It's very tempting!**

BRITISH LAMP MAKERS AND THE SWAN LAMP CAP PATENTS

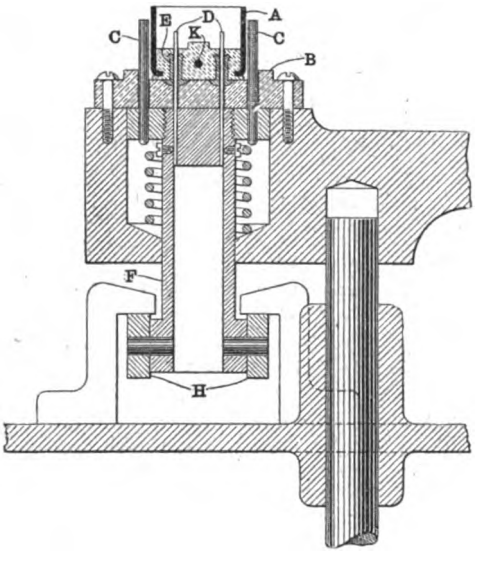
MANY of our readers have received, and are somewhat mystified by, the following communication from the General Electric Co., Ltd.:—

DEAR SIRS,—It has recently come to our notice that some of our customers who buy from us incandescent electric lamps manufactured with Vitrite caps have been threatened by certain makers of such lamp caps with legal proceedings for what they claim to be an infringement of their patent rights.

We desire that our customers should be free from the anxiety, annoyance, and expense of patent litigation in connection with goods manufactured and supplied by us, and, therefore, have pleasure in handing you the enclosed indemnity.

[A formal document is enclosed indemnifying the recipient in respect of legal proceedings as indicated above.]

It appears that a letter has been sent round by the British Vitrite Works (Swan's Patents), Ltd., to the principal incandescent lamp manufacturers of this country, calling their attention to the fact that the company are the owners of certain lamp cap patents which, it is claimed, cover the process and machinery employed in the manufacture of the caps used by British manufacturers, and suggesting compensation and the purchase of licences.



There are two patents concerned, the first of which (taken out in 1902) is in the name of Mr. A. Swan, of the General Electric Co. of America. The British rights in this case, however, did not become the property of the British Thomson-Houston Co., but were retained by Mr. Swan, who, on March 30th, 1909, assigned them to a company which had been formed in London under the name of Swan's Patents, Ltd., together with the second patent for £2,000. He guaranteed the validity of the first patent for three years, and stated that no caps were at that time being manufactured in the United Kingdom under the patent, and that no person or company had a right to use the process and machinery described in the patent. Further, Mr. Swan undertook to supply any number of the machines required for the manufacture of these caps at the price of £70 apiece. In April, 1909, Mr. Swan had been allowed to amend the first two claims of the first patent to limit the scope of the invention (see ELECTRICAL ENGINEERING, Patent Record, March 4th and April 29th, 1909), and Swan's Patents, Ltd., obtained a further amendment of these claims in February of this year (see ELECTRICAL ENGINEERING, Patent Record, December 30th, 1909, and February 17th, 1910). On February 3rd the rights of the patents were transferred to a new company called the British Vitrite Works (Swan's Patents), Ltd.

The first patent is No. 12,739 of 1902, and relates to a lamp cap in which the metal shell is interlocked with a glass filling uniting the contacts. The specification describes a machine for making such caps. This comprises a gas-fired furnace in which the glass mixture is fused and kept in a liquid condition, and automatic mechanism for filling and moulding the caps. The metal cylinder or shell, *A*, is placed on a plate, *B*, at the end of an arm of a rotary head, which moves the several shells under the furnace opening and the die in succession. The shell is held in position by pins, *C*, and the contact studs, *E*, are placed in position over two vertical pins, *D*. After the proper amount of glass has been poured in, the shell is moved automatically underneath the die which moulds the glass web into shape, and is then rotated into a third position. Here the rollers, *H*, are depressed under a rail, and the pins *C* and *D* drawn down so as to release the completed cap which is swept off the plate into a box. In the figure (which is one of 24 in the specification) the piece of rod forming the bayonet pins of the cap is represented at *K*. Wires to connect the filament to the contact studs are passed through the holes left by the pins *D*, and the cap is then cemented to the lamp bulb.

There are nine claims to the patent, of which the first and third are representative. These are as follows:—

(1) The improved incandescent lamp base, characterised by a metallic shell interlocking with a binding button formed from a stream of highly fluid or liquid glass, automatically fed in measured quantity into a succession of moulds containing the assembled metallic parts, the glass being subsequently by a further automatic movement moulded, pressed, or otherwise formed so as to unite the metallic terminals, substantially as described and shown in the attached drawings.

(3) The improved machine for forming incandescent lamp bases, embracing a glass melting furnace, having an opening which forms an exit therefrom, through which the molten glass may flow, in combination with means which, by a movement, will successively bring moulds containing the assembled metallic portions of the bases adjacent to the opening to permit a proper

quantity of glass to flow therein, and by a further movement will bring the parts within the sphere of action of a moving die to press and form the glass in the proper configuration, substantially as described and illustrated . . .

The second patent is No. 14,597 of 1903, and covers certain improvements in the machine described in the previous patent. A somewhat simpler mechanism is employed, and means are provided for protecting the parts from the great heat. For example, the die is provided with a water-jacket. To ensure a free opening for the connecting leads, a punch is forced through the holes left by the pins, and compressed air is employed to eject the finished caps from the moulds. Provision is also made for cutting away any surplus glass, and means are provided for varying the speed of the machine according to the fluidity of the glass. There are 12 claims to this patent.

We understand that the present position is by no means a surprise to some of the lamp manufacturers at least, who had been expecting it for some long time. After inquiry, not only at the offices of the General Electric Co., but also of other leading manufacturers in this country, we are able to state that they will unitedly oppose the demands of the British Vitrite Works. They do not admit that any British lamp manufacturers use caps made according to the process or by the machinery covered by the Swan patents. An extremely large proportion of the caps used on British-made lamps are purchased abroad, and there is reason to doubt whether the British Vitrite Works (Swan's Patents), Ltd., are in a position to manufacture in this country the large supply of lamp caps that are needed from week to week. If, therefore, legal proceedings are instituted against the lamp manufacturers, it is evident that the latter will not only plead that they do not infringe, and also contest in the usual manner the validity of the patent, but that they will also apply for the revocation of the patent under Clauses 24 and 27 of the new Patents Act.

So far as the retail lamp buyers and the general public are concerned, we cannot but think that the letter which we have quoted at the commencement of this article over-estimates the extent of the aggressive action which the owners of the Swan lamp cap patents are taking at present. In the only cases brought to our notice, the British Vitrite Co. have been shaking their fists only at the lamp manufacturers and not at the trade generally. In any event, however, those who buy their lamps from the leading British firms have nothing to fear, for our inquiries have established that these firms are prepared to indemnify their customers from any possible legal proceedings.

MR. ALEXANDER SIEMENS' PRESIDENTIAL ADDRESS TO THE INSTITUTION OF CIVIL ENGINEERS

MR. ALEXANDER SIEMENS commenced his Presidential Address to the Institution of Civil Engineers with a few words on the present by-laws and ways in which they had been modified from time to time.

He then passed on to a comparison of conditions in ancient and modern times, and said that although in literature and art or in philosophy we could not boast of being greatly superior to the ancients, as far as engineering problems were concerned we had enormously advanced, thanks to the practical application of scientific theories. This progress he attributed mainly to the improvement of the means of communication and to the saving of manual labour by the introduction of mechanical power, which main features had caused a general lowering of the cost of "obtainables." Everybody readily agreed that improving the means of communication was a desirable form of progress, but, curiously, the consequences of improved communication were not yet fully appreciated, and the saving in manual labour was still looked upon askance by those most concerned. The development of the manufacture of glow-lamps was a striking example of the advantage of labour-saving machinery; at first the lamps were made by a few skilled workers at a high cost, so that they could not be sold for less than twenty-five shillings each. This excessive cost naturally restricted their sale, but the efforts of the manufacturers to devise labour-saving machinery were not relaxed until the selling price of glow-lamps had diminished to its present level, when they are sold by the million. Can anybody doubt, he asked, that the introduction of labour-saving machinery into this industry, far from diminishing opportunities for employment, has not only benefited the skilled workers, but has opened new avenues for profitable employment to the so-called unskilled labour? Coupled with this anomalous attitude regarding machinery was another fallacy equally difficult to eradicate, indicated by what is usually called "restriction of output." Lowering of cost should be the guiding principle of all engineering design; and by accepting this we admit that successful engineering must be based not only on technical knowledge, but on the proper understanding of economic laws.

With regard to contractors' work, the conditions of which had not changed much during the last sixty years, the consulting engineer must be the real expert with a varied practical experience of similar work, in possession of all the necessary preliminary data for designing the complete works. This was different with manufactured produce which was utilised in engineering works, the variety of which was constantly increasing, so that it was perfectly hopeless to expect every engineer to be acquainted with every detail of their manufacture. Trained technical experts were nowadays entrusted with the task of directing industrial operations in factories, and it was inevitable that they should know more about manufacturing methods and requirements than outsiders.

Complaints had been made that some engineers had taken advantage of this circumstance by specifying results only and inviting manufacturers to submit detailed descriptions of the means proposed by them for obtaining the specified results. This procedure implied that six or seven complete specifications have to be worked out by the manufacturers invited to tender instead of only one by the engineer, and, it was complained, this enabled a person who was not competent to draw up a satisfactory specification by himself, to act as superintendent of works to the exclusion of really competent engineers. In fact, it was alleged that sometimes the first proposals were not accepted, but their details were utilised by the engineer for drawing up a complete specification of his own. Mr. Siemens submitted that a solution to the problem had been to some extent found in the establishment of the Engineering Standards Committee. By referring to their publications the consulting engineer could rely upon obtaining apparatus that would pass the tests therein specified, and the manufacturer could adapt his processes to the requirements set out by the Committee without the risk of being invited to quote to specifications which might upset his methods of manufacture without benefit to anybody.

The task was made more difficult by the international character of the competition in manufactured articles, which accentuated the necessity not only of doing all that was possible to increase economy of production, but also to facilitate in every way the introduction of new industries, and in this the new Patent Act had been productive of great benefits. In this connection, he considered that Parliament would be quite justified in regarding the commercial success of a patented invention as a proof of its benefitting the community, and therefore making it unassailable except by prior commercial use.

The same reasons that had led to the establishment of the Engineering Standards Committee in this country held good for international dealings, so that we might look forward to the time when international standard specifications will be accepted all over the world. A beginning was made when the British Association introduced in 1861 the C.G.S. system of electrical units, which, since that time, had been adopted internationally, and a further step had been taken at the St. Louis Exhibition of 1904, when the International Electro-Technical Commission was called into being. It was a very significant circumstance that it had been found necessary for this Commission to associate itself in some branches of its activity with the Engineering Standards Committee, and it was not unreasonable to expect that such joint international action would gradually extend beyond the field of electricity.

MR. J. S. PECK'S PRESIDENTIAL ADDRESS TO THE MANCHESTER SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

MR. J. S. PECK (British Westinghouse Electric & Manufacturing Co.) said in his presidential address delivered at last Friday's meeting of the Manchester section of the Institution of Electrical Engineers that he believed that, with a single exception, he was the only American to occupy the position of chairman of a section of the Institution. He had recently returned from a trip to the United States, and would devote his address to a review of the condition of electrical engineering in America.

There had been great advances in electric traction, and the traction department of a manufacturing company presented a very different appearance from that of a few years ago, for while one still saw the usual standard type of tramway motor, there were also large motors for the enormous electric locomotives which were now being used by many of the main steam roads for drawing trains in and out of their terminal stations, and for hauling trains through tunnels. These motors resembled slow-speed engine-type generators more than tramway motors, and the sight of cranks, jack shafts, and connecting rods on electric locomotives was new to anyone who was not closely associated with this work. He referred to the continuous-current system of the New York Central, and the single-phase system of the New York, New Haven & Hartford Railway, the extensions to the latter of which were really the prelude to electrical working all the way from New York to Boston, a distance of 250 miles. The electrification of the Pennsylvania system into New York City was well under way on the direct-current system, and the locomotives were the most powerful that have yet been built. With regard to tramways, commutating pole motors were now largely employed, cars were becoming larger and more powerful, and "pay as you enter cars" were much seen.

Passing on to high-tension transmission, he remarked that several plants are operating successfully at 110,000 volts, and 200,000 volts appears much nearer than did 100,000 ten years ago.

Difficulties with lighting were much reduced by earthed metal rings round the insulators, and the electrolytic arrester was being almost universally adopted. Steel towers and long spans were the rule, and the towers were often made flexible in the direction of the line.

In turbo-generators the tendency was to higher and higher speed. The generators were not usually designed for close inherent regulation, but external automatic regulators were used. External methods of ventilation were not much used. Progress in D.-C. turbo machines had been greater in Great Britain than in America. He also referred to some features of American transformers, which were mostly of the shell type. With regard to motors, the manufacturing companies had been devoting a great deal of time and money to increasing the demand and assisting the supply companies in their power canvassing. He had been struck with the quantity as well as the quality of the measuring instruments turned out. With regard to arc lamps, the great majority of the arc lamps in use in America were of the enclosed type, but the flaming arc was coming into more general use. For street lighting, the lamps were usually run in series from a constant-current generator, or from a constant-current transformer. The magnetite lamp was also coming into use.

The prosperous condition of the large companies enables them to carry large engineering staffs, to support research and experimental laboratories, and to undertake the development of new lines of apparatus, and of new electrical systems, on a scale quite impossible for the manufacturers of this country.

The latter part of the address was devoted to a consideration of some of the factors which have contributed to the more flourishing state of the electrical industry in America than in this country. America was a rapidly growing country, and its business men were more daring; technical education was more advanced and more appreciated; the restrictions imposed by labour organisations were not so severe, and municipal control of electric supply and tramways was not so general. The comparative absence of Government restrictions left engineers a freer hand, and in America consulting engineers did not bind the manufacturers down to details. He also was of opinion that, regardless of whether a tariff would help Great Britain or not, there was no doubt that it has greatly helped the American electrical manufacturer.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

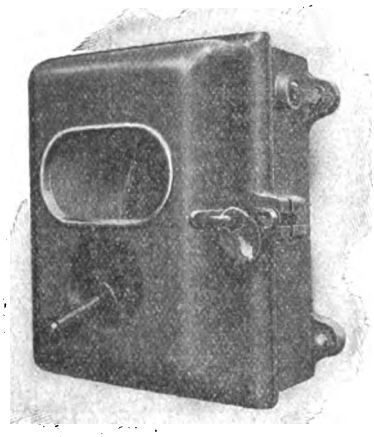
THE ASSOCIATION OF MINING ELECTRICAL ENGINEERS

SINCE the publication of last month's supplement on ELECTRICAL ENGINEERING IN MINES, the Association of Mining Electrical Engineers has held its first annual general meeting. Mr. W. Maurice, the President, occupied the chair.

In the annual report it was announced that Mr. E. Kilburn Scott had been appointed editor of the transactions of the Association, and the council recorded its appreciation of the services of Mr. J. H. C. Brooking, who had hitherto acted as honorary editor. The accounts are also published, and it is satisfactory to note that each of the eight branches has a balance in hand. The formalities in connection with the registration of articles of association and the incorporation of the Association are not yet complete.

The President's Address referred to the good progress made by the Association, and emphasised the need for the co-operation of every section of the mining industry. It then passed on to a consideration of the proposed scheme of holding examinations and granting certificates, for which the Council were about to establish an Examination Board, and Mr. Maurice invited opinions on the standard of knowledge which should be required. Some discussion on the point ensued, and finally a sub-committee, consisting of Messrs. Maurice, Thornton, and Fisher, was appointed to draw up and to issue for discussion by the Branches a model examination paper. The annual dinner was held in the evening.

After the adoption of the report, and before the President read his address, he invited general discussion and criticism of the work of the Council. Mr. Justus Eck, of the Union Electric Co., Ltd., who is a member of the London Section, took advantage of this invitation to complain of the difficulty he had in keeping in touch with the other branches of the Association. The London branch, he explained, was neither very large nor very active, and as notices of meetings in each branch are only sent out to the local members, he was given no opportunity of hearing what was going on in the branches throughout the country. Mr. Eck is perfectly justified in his complaint. We attended one meeting of the London branch, at which the number present was three: the Chairman, the London Honorary Secretary, and our own representative. This was, we believe, the second meeting of the session, and it may also have been the final one for all we know, for the Association has recently initiated the policy of refusing to admit representatives of electrical newspapers to its meetings. For this account of the annual meeting even, we have to be indebted to the official report. This attitude towards the electrical journals is much to be regretted, and we are convinced that the policy which dictates it is short-sighted. So far as we ourselves are concerned, we have done our utmost to further the interests of the Association from its very inception; our articles on the aims and objects of the Association were the means of obtaining a large influx of members at the outset, and as soon as the local branches were inaugurated we took considerable trouble to make arrangements to give our readers prompt and accurate reports of the meetings all over the country. Cases arose, however, at which our representatives were asked to refrain from reporting the meetings, although they had sometimes travelled from a distance for the purpose, and at some branches they were actually refused admittance on instructions from the headquarters. Finally, after some correspondence, we were officially informed that these efforts of ours to spread the knowledge of the doings of the Association were not desired. We still endeavour—for the convenience of members desiring, as Mr. Eck, to attend the meetings of other branches than their own—to notify the dates of forthcoming meetings in our "Arrangements for the Week" column, but it is only some of the local honorary secretaries who are able to give us notices of meetings by the previous Wednesday, and these do it of their own initiative, as they are not encouraged to do so by the Council.



We have reason to believe that the general body of members are not in agreement with the Council's attitude upon this matter. The technical Press can be of the utmost use to a young and, we may say, struggling body such as this; and we cannot see that the Association can in any way better its position by an independence which rejects offers of friendly assistance, or by a diffidence which fears the publication of accurate reports of its discussions in the independent and representative papers of the industry. The Council should profit by the examples of the Institution of Electrical Engineers and the Institution of Mechanical Engineers, and many other similar bodies, who have consistently followed the policy of advising the Press of all their meetings well in advance, and of giving every facility for the full and prompt reporting of papers and discussions. It is largely to this policy that these institutions owe their present influential positions.

It would be a matter of great regret if, after the self-sacrificing manner in which Mr. Maurice has devoted himself to the evolution of the Association of Mining Electrical Engineers, and the able support given him by the other members of the Council, their efforts should be crippled by the adoption of the policy which we have taken the liberty of criticising. It is rumoured that the Council has committed itself to this policy by a business arrangement for the purposes of temporary economy, the disastrous results of which they had failed to foresee, and, if this is so, the sooner this arrangement is cancelled or modified the better. Those who are not permitted to penetrate into the sanctity of the Council Chamber can see no excuse for the ungracious and even discourteous refusal to accept the assistance which has been so cordially and ungrudgingly offered by the electrical engineering press.

ELECTRICAL EQUIPMENT OF THE OAKDALE NAVIGATION COLLIERIES

THE Oakdale Collieries, in the Sirhowy Valley, near Blackwood, Mon., are about 600 feet above the sea-level, and when fully developed will be amongst the largest in the South Wales and Monmouthshire Coalfield. At the present time there are two shafts, but ultimately a third shaft will be sunk in connection with the house-coal seam. In addition to the present shafts, a level—called the Waterloo level—containing some electrical plant is being worked.

The generating station is about midway between the two pits. It is a large and substantial structure, well ventilated, and lighted by arc and incandescent lamps at night. On one side of the generating station is an annexe, in the basement of which are the cells containing the high-tension switchgear. The upper part of this annexe gives ample room to get behind the main switchboard, the front of the switchboard being in a line and flush with the front wall and facing into the building. The wall above the switchboard, which is, of course, also above the annexe, is carried by substantial arches. The basement floor is just above the ground-level, and the engine-room floor is about twelve feet above it. This gives ample room for the high-tension cells and switchgear, also for the 375 k.v.a. transformer, and for the large-diameter exhaust pipes and valves. In the engine room, a view of which is given in Fig. 1, are two 1,000 kw. Willans-Dick Kerr mixed-pressure turbo-alternator sets of standard construction. 3,300 volts, 50 cycles, 1,500 r.p.m. These turbines are each fitted with motor-controlled governors. The main steam pipes are on the other side of the engine-room and above the engine-room floor. The high-pressure inlet pipes to the turbines are taken off the main range, and the low-pressure inlet pipes pass up through the engine-room floor from the basement beneath. The foundations for these turbine sets are of very substantial build, consisting of local stone, the corners being faced with brick. These sets have been working continuously day and night for the past twelve months, and we are informed that since the date of starting up, they have never given the slightest trouble. Under service conditions, one set is working continuously day and night for one week, the other during this time acting as a reserve. At each week-end they are paralleled and changed over, the reserve set taking up the running for the ensuing week. These sets were working under high-pressure steam only, but lately the exhaust pipes from the winding engines and the accumulator have been completed, and the turbines are now working under normal conditions with "mixed pressure." The exhaust steam from the winding engines is being taken full advantage of whilst the pits are being sunk, enabling a great economy in steam and fuel consumption to be obtained while sinking is in progress. Each turbine has a jet condenser of Körting Bros. manufacture placed immediately outside the generating station. They are complete with the necessary stop valves to isolate either or both condensers, and also with automatic atmospheric exhaust valves in case either condenser should fail. There is a natural draught cooling-tower in connection with the condensing plant. This, and the tank immediately beneath it, are on a considerably higher level than the condensers, this arrangement giving the necessary amount of "head" to the injection water. The injection water, after passing through the condensers, is discharged into a large hot well, and then delivered to the top of the cooling-tower by means of three centrifugal pumps driven by means of alternating-current motors, 500/550 volts, 50 cycles. The pump house containing these pumps and motors is at the side of the main building. High-pressure steam is supplied to the turbo sets by six Babcock & Wilcox water-tube boilers at 200 lbs. per sq. inch. They are situated in the boiler house, at a considerable distance from the generating station and near the South pit. There is a large brick chimney in connection with these which carries the smoke and gases well clear of the collieries, a most important point with regard to the ventilating of the mines. The boilers are fitted with the "Underfeed" type of stokers. The coal is delivered into a travelling belt conveyor by means of a hopper in the basement, and then carried up and over the coal shutes, whence it is delivered, and so gravitates down to the stokers. The low-pressure steam from the winding engines is carried to the heat accumulator through an oil

separator, and before it reaches the turbines, through an automatic isolating valve. This valve comes into operation should any exhaust steam be obtained from the winding engines. The turbo-alternators supply the whole of the power and lighting, both for the surface and for the sinking operations, and, of course, will

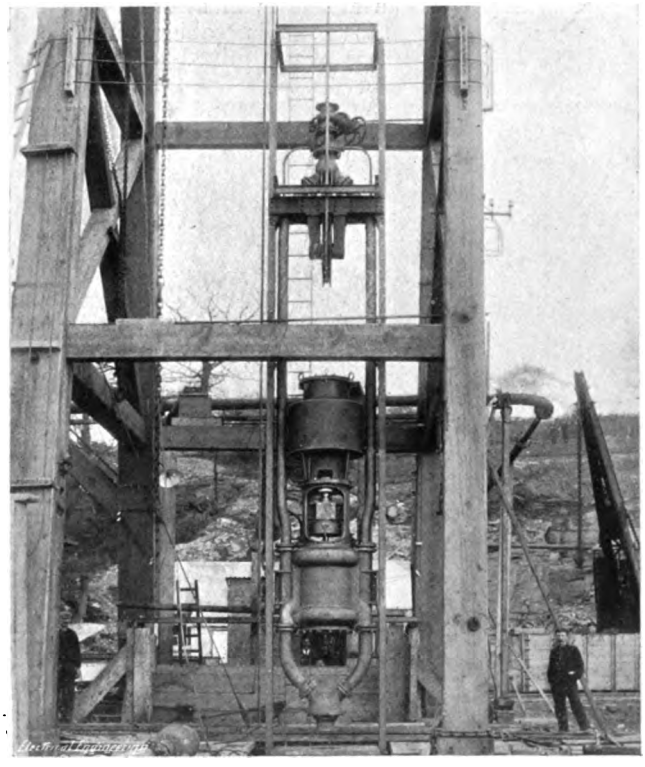

FIG. 2.—ELECTRICALLY-DRIVEN SINKING PUMP.

ultimately supply the necessary power for the fan motors for ventilating the underground workings as the pit develops. Direct-current is used in connection with the arc and incandescent lamps on the whole of the surface and in the various buildings. This is supplied by means of a motor generator-set in the generating station at 220/230 volts. The power for the surface, and also for the sinking operations, is obtained from the step-down transformer of 375 k.v.a. capacity already mentioned, which transforms the pressure from 3,300 volts to 550 volts. This pressure has been adopted for the whole of the motors on the surface; also for the motor-driven air-compressor (situate in the generating station), and for the sinking pumps. The air-compressor supplies the necessary compressed air for working the drills used in connection with the blasting whilst sinking the pits. There are two sinking pumps, one in each shaft, and these are of Messrs. Sulzer Bros. manufacture; one of them is shown in Fig. 2. They are guaranteed to deliver 36,000 gallons of water per hour against a head of 500 feet. The motors driving these pumps are of 175 h.p. each. These sinking-pump motors have now been working day and night since sinking operations commenced, without giving the slightest trouble. One is dealing with, roughly, 20,000 gallons per hour in the North pit, and the other about 10,000 gallons per hour in the South pit. These pumps were originally taking the water from the bottom of the pit, where the men were working, and delivering it into a temporary pump lodge above, until they had sunk the shafts to the depth decided upon for the permanent pump lodge. In the temporary pump lodge there was originally installed a 600 b.h.p. motor direct-coupled to a Sulzer pump, and this, up to the time of its removal, had been for many months delivering about 40,000 gallons of water per hour from this temporary pump lodge to the surface, a distance of 180 yards. This was only a small temporary lodge, and contained the necessary switchpillars, liquid starter, &c., in connection with the motor. The Colliery Co. have now completed their permanent pump lodge, mentioned above, which is 293 yards below the surface; the pump and its motor, which has dealt with the water up to the time of the completion of the permanent lodge, has now been dismantled and permanently erected in the latter lodge, together with a duplicate set as a standby, so that the pumping sets have not only served a useful purpose as a temporary measure during the early part of the sinking, but have now been put into permanent operation, for which they were originally intended, thereby, it will be noted, saving the extra expense of temporary sets, a most important saving from the colliery owners' point of view; and in this point alone proving its superiority over the old-fashioned steam pumping sets, which, in most if not all cases, had to be thrown aside when the sinking operations were completed. The 600 h.p. pump motors which are at present working in the permanent pump lodge, are designed for 3,000/3,300 volts, and the high-tension feeder to this runs from the main switchboard in the generating station down to the pump lodge. It is three-core, double-wire armoured, and is securely cleated to the side of the shaft. There is also a 500/550 volt three-core cable taken down each shaft for the purpose of supplying the current to the sinking-pump motors. The cables are lowered by means of cable drums as the shafts get deeper. The sinking pumps and motors are carried in special frames, and are designed so that they can be raised and lowered at

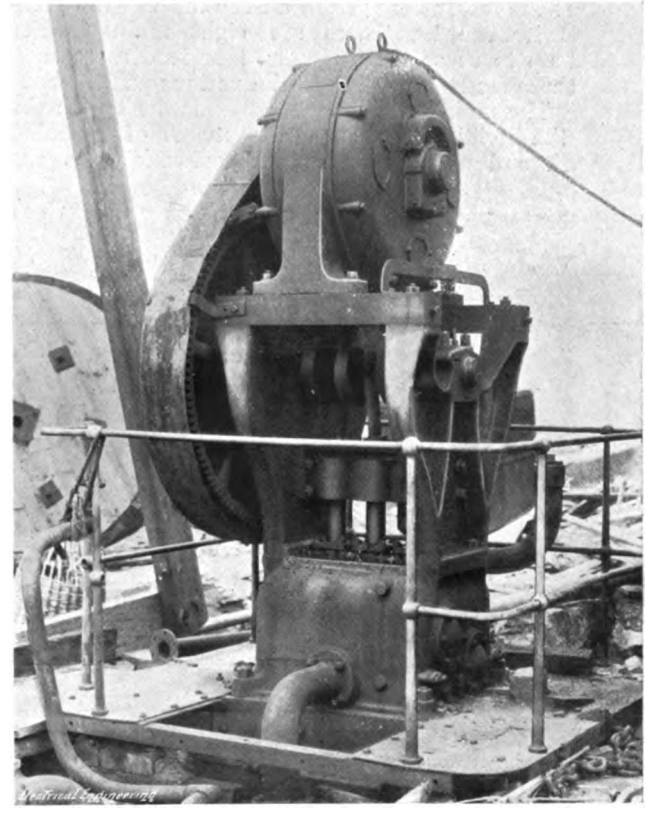

FIG. 3.—ELECTRICALLY-DRIVEN SURFACE PUMP.

will. It has been found by actual practice that these sinking pumps are superior in every way to the old-fashioned steam-driven sinking pumps, there being no heat, no escaping steam, no noise, no undue vibration or knocking due to the hammering effects of the rams, as is the case with steam-driven pumps, not taking

Digitized by Google

into consideration the very much smaller space and the rapidity of handling which can be obtained by means of the motor-driven type of pump. For lighting the bottom of the shafts during sinking operations, a direct-current cable is taken down, the necessary current being supplied by the motor generator in the generating station. The lighting for the pump lodge is obtained by means of a small transformer in the switchpillar in the pump lodge itself. The 500/550-volt motors on the surface include one 55 h.p. motor working a Sturtevant fan for ventilating the shaft during sinking operations; a similar size motor, working the haulage at the Waterloo level, dealing with about ten loaded trams per journey, and running the trams from the level up to the screens, a distance of, roughly, 300 yards. There is also a 20 h.p. motor working the three-throw pump on the surface, seen in Fig. 3, and another of the same size working a mortar mill. In fact, practically everything which needs driving is driven electrically.

Referring again to the generating station, there is a main switchboard consisting of two generator panels complete with main switches with time-limit relays, wattmeters, ammeters, and voltmeters for each unit. There is also one spare generator panel. In connection with this switchboard, there are also three Thury regulators on one common shaft; two regulators are at present coupled up to the two turbo sets, the remaining one being a spare for a future turbo set. These regulators are shown in the foreground in Fig. 4. They are capable of being driven by a motor at either end of the shaft, one motor always standing as spare. There are three high-tension feeder panels, two of which are in use, the third being a spare. These are complete with ammeters and voltmeters and earth detector, the latter being fixed on the top in the centre of the switchboard. There are eight main feeders coupled up to these three panels, four feeders to each panel, three feeders running to the various points about the pit. The main switchboard, which is flush with the wall of the building, is protected by means of expanded steelwork and also an expanded steelwork door, the

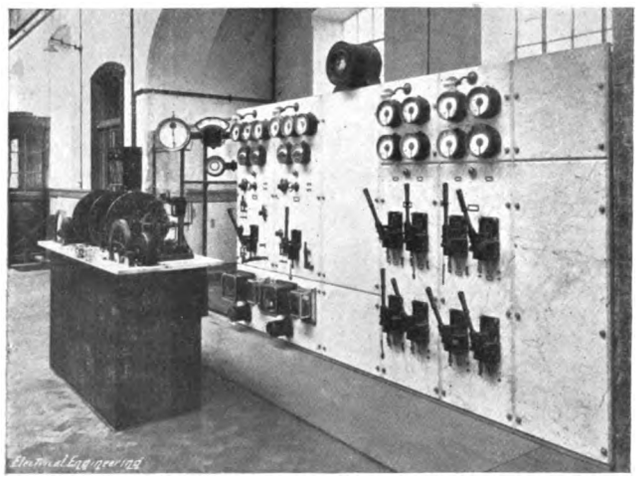

FIG. 4.—MAIN SWITCHBOARD AND THURY REGULATOR.

latter being locked and under the control of the engineer in charge of the station. The high-tension chamber is in the basement, immediately beneath the H.T. switchboard. This chamber comprises sixteen cells, some of which are shown in Fig. 5, all these being in connection with the high-tension feeders and the alternators. The cells have expanded steelwork doors, and these are also kept locked and under the charge of the engineer on duty. Furthermore, it is impossible to open any of these doors unless the isolating switch is previously opened, thus doubly safeguarding the attendant or any other person who may be in the basement. It will, therefore, be seen that the whole of the high-tension gear is secure from access by any unauthorised person.

Messrs. Dick, Kerr & Co. were the principal contractors for the work, and we are indebted to them for technical particulars of the plant and for the photographs with which this article is illustrated.

Further developments at this colliery include a 3,000 kw. turbo-generator of the mixed-pressure type,

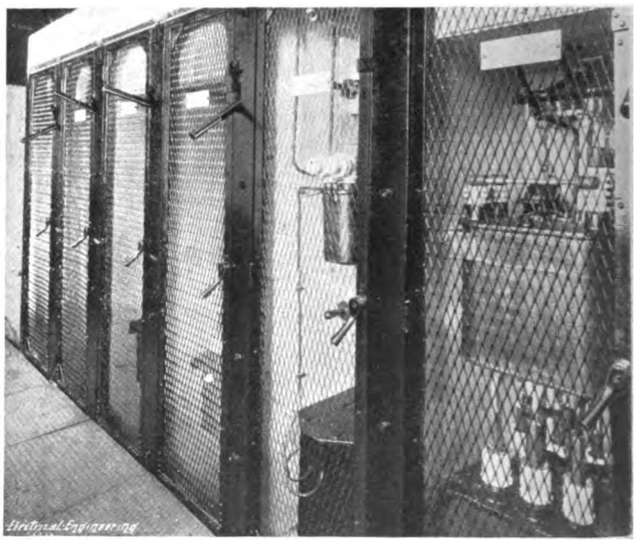

FIG. 5.—CELLS FOR H.T. SWITCHGEAR IN BASEMENT.

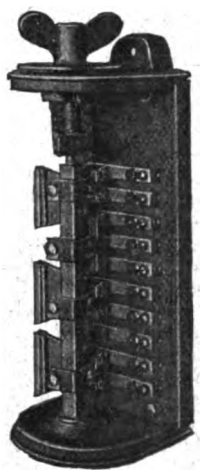
and transformers for supplying the whole of the electrical power, including two large electrical winders, at the Markham pits, about two and a half miles distant from the Oakdale pits. The transmission line will be in duplicate, and will work at 6,600 volts.

The Markham pits will be operated entirely by electrical power. No steam boilers will be erected at this pit, which will have an output of from 2,000 to 3,000 tons per day.

The whole of this work has been carried out to the specifications of Messrs. Scott & Leggat, Cardiff, the consulting engineers to the Company, to whom our thanks are due for revising and adding to this description.

ELECTRICAL MINING PATENTS OF OCTOBER



AMONG the Patent Specifications of interest to electrical mining engineers published during the past month is No. 19,359/09, by J. G. Patterson, of Darlington. This covers the combination with a portable electric miner's lamp of a miniature oil lamp for indicating the presence of gas or fire-damp. The oil lamp is not intended to give light, but merely to act as a detector of fire-damp. It is mounted on the electric lamp case in such a way that it cannot be opened while the cover of the electric lamp is in place. Normally it is not alight, but to test for gas, the switch of the electric lamp (which is inside the flame lamp) is turned so that the electric lamp is switched off and a platinum spiral above the wick of the oil lamp caused to glow and ignite the wick. When the electric lamp is again switched on the oil lamp is automatically extinguished.

Patent No. 23,739 09, by G. M. Capell, of Passenham, Bucks, describes means for turning an exhaust fan into a blowing fan without changing the direction of rotation. A reversing passage following the volute of the fan casing is provided. It is above the fan and a door is provided to close it when blowing.

Improvements in the boxes for holding the cutters of coal-cutting machines of the disc and chain types are covered by Patent No. 26,064/09, by F. Eckersley and W. Creswick, of Wakefield, and a construction for a cutting-wheel for a disc machine is described by Anderson, Boyes & Co., Ltd., of Motherwell, in Patent No. 29,762/09.

ELECTRICAL ACCIDENTS EXAMINATIONS FOR COLLIERY ELECTRICIANS

Discussion before a Branch of the Association of Mining Electrical Engineers.

At a meeting of the Cumberland Branch of the Association of Mining Electrical Engineers on Saturday, October 22nd, at Workington, a discussion was held on the causes of four colliery accidents, of which reports had been sent to the branch secretary. The first was that described in ELECTRICAL ENGINEERING IN MINES, October 6th, p. cii., in which a man at the South Rhondda Colliery received a fatal shock from a loose signal wire which had come in contact with a defective joint in a main cable. The discussion was confined chiefly to the chairman (Mr. T. P. Martin) and the secretary, Mr. J. Glynn Williams, who expressed the opinion that there was contributory negligence on the part of the electrician responsible for the joint. One or two similar cases were mentioned. The next accident to be discussed, in which a man had opened up a 3,000-volt oil switch without seeing that the current was off (see ELECTRICAL ENGINEERING IN MINES, August 4th, p. lxxxvi.), was productive of a plea for juries composed of men of technical knowledge, but it was finally agreed that the fatality was due to pure carelessness. The third accident to which the secretary drew attention was one at Normanton, the circumstances of which were given in ELECTRICAL ENGINEERING IN MINES, July 7th, p. lxxxii. This accident was, he said, due to rising water breaking down the insulation of the trailing cable of a coal cutter. He advocated men wearing clogs instead of boots in such cases as lessening the risk of shock. Finally, the details of the Wingfield Colliery fatality (see ELECTRICAL ENGINEERING IN MINES, May 5th, p. lix.) were put before the meeting. This appeared to have been due to faulty connections at a gate-end box, and a verdict of accidental death was returned. Some discussion ensued upon the nature of coroner's juries' verdicts. Mr. Williams repeated his plea for technical jurymen, but the Chairman pointed out that the Electrical Inspector of Mines was present to guide the jury. A case, however, was referred to in which a man who died from heart failure had his death attributed to electric shock.

The following dates for meetings of the branch were decided upon :—November 19th (Whitehaven), December 17th (Workington), January 21st (Whitehaven), February 18th (Workington), March 18th (Whitehaven), and April 22nd (Workington).

Mr. Williams then opened the discussion on the question of examinations for members, and mentioned that Prof. W. M. Thornton (Armstrong College, Newcastle) had offered to look the papers through for the first twelve months, and make the awards free of cost. Mr. Williams was himself in favour of the examination being conducted by a body independent of the association, and suggested that the papers should be divided into four classes, comprising mining rules and conditions, wiring, theory, and practical work. Various proposed details were spoken of, and the inclusion of ironworks electricians was suggested. The discussion then turned on the qualifications of a mining engineer, and it was generally agreed that qualification for the association's certificate should include so many years of practical experience. It was recommended that each candidate should serve or have one year's practical experience and third stage science and art of mining certificate, or two years as electrician underground. One or two other recommendations as to matters of detail were also made.

ELECTRICAL MINING ACCIDENTS

On September 20th last an assistant winder, J. Peel, at the winding-engine house of the Denaby Main Colliery, Mexboro', was killed in circumstances which point to electric shock being the cause of death. The winding-engine in question is driven by a 3,000-volt motor, with a liquid starter in the rotor circuit. It appears that the engineman had sent Peel to fill up the tank of the starter, and that shortly afterwards he heard an exclamation, and then found Peel lying insensible across a rail near the tank. It is supposed that Peel had put his hand in the water to see if it was hot, and that the motor had been switched in while his hand was in the water. He would have received a pressure of about 360 volts. The doctors' evidence pointed to heart failure as the cause of death, but the postmortem showed nothing to account for it, and no signs of burn. At the inquest on September 30th, the jury returned a verdict of accidental death by electric shock, sustained by Peel putting his hand into the liquid starter. Surprise was expressed by the engineers of the colliery that the engineman and Peel made a practice of testing the temperature of the water with their hands. Mr. R. Nelson (H.M. Electrical Inspector of Mines) was present at the inquest.

At the Hamilton Court, on October 14th, Sheriff Thomson and a jury investigated the case of T. Aitken, a miner of Home Farm Colliery, Ferniegair, who was killed while operating an electric coal-cutter of the disc-type. A verdict was returned to the effect that Aitken was killed while guiding an electric coal-cutter along the face, but it was stated that there was no satisfactory evidence as to the cause of death. Mr. R. M'Phail, electrical engineer at the colliery, and Mr. R. M'Laren, H.M. Inspector of Mines, both stated that they had thoroughly tested the coal-cutter, and had found nothing wrong with it. There was a complete system of earthing in use in the mine, and any leakage would have been indicated. Mr. M'Laren asserted that the man was killed through being drawn in between the skid and the haulage rope, and that the latter had crushed him so that his neck was broken. The doctor had first certified that Aitken's neck was broken, but later suggested something about electric shock.

An inquiry was held in Manchester, on October 24th, into the circumstances attending the death of T. Merrick, a "jigger" employed at the Bradford collieries, who was killed on October 19th by electric shock received by grasping a signal wire. It appears that the signal wire was in contact with the armouring of a cable, and that the armouring was alive. The electrician of the colliery stated that after the accident he found a leakage in a switch-box at the far end of the cable which would account for the armouring being alive. The pressure was 525 volts D.C. The current should not have been on at the time, but it was not discovered who had closed the switch. The jury returned a verdict of accidental death, adding that they considered the switch was too easy of access to unauthorised persons. Mr. T. H. Dixon, manager of the colliery, stated that this was the first trouble the company had had with the electrical plant, which had been employed in the collieries for eight years. He suggested that the switches should be placed under lock and key.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during October.

Oct. 6th.—Monthly supplement on ELECTRICAL ENGINEERING IN MINES, opening with an account of the electrical installation at the Broxbourne Oil Co.'s shale mines, and a special article on electric lighting in mines also appears. A report is given of a recent case in which the Home Office prosecuted a mine manager for contravention of the special rules, and a short article summarises a few of the most important electrical mining patents published in September. Another article describes examples of electric power installations at New Zealand gold mines, and some interesting experiences with an electric pumping plant are described, showing how various difficulties were overcome.

Oct. 13th.—Standard Lampholders. Descriptions of new electrical supplies and accessories.

Oct. 20th.—The cost of lighting by metal filament lamps. Description of a new locking lamp holder. Engineering and Machinery Exhibition in Manchester. Portable ventilating set.

Oct. 27th.—Illustrated article on the arrangement of overhead mains at Dowlais. Appeal with regard to the Ilgner patent. Motors for machine tools.

BRITISH PARTICIPATION IN INTERNATIONAL EXHIBITIONS

WITH the close of the exhibition season it is interesting to call to mind the part that has been played by the recently formed Exhibition Branch of the Board of Trade. The work of the branch has been carried on quietly and unostentatiously, but has been of the greatest assistance to exhibitors. An organisation has been created capable of dealing with any number of exhibitions at which it is decided that it will be for the benefit of British trade to be represented. The trades and industries of Great Britain and Ireland which have any chance of extending their business in the country in question are made aware of the possibilities, and then are given an opportunity of purchasing space at a moderate figure. There are special rates for carriage by rail and by sea, and at the exhibition gates the British authorities take charge of the packing cases, assist in unpacking, provide stands, and arrange the exhibits if asked to do so. Suitable colour schemes are arranged for the different buildings, and every effort is made to ensure that each stand contributes to make the whole effective. Contracts are also made on a wholesale scale for the supply of gas, water, and electricity, for the benefit of exhibitors. Their packing cases are stored during the exhibition, they are assisted to re-pack, and have special transport facilities for the return of what has been unsold.

The work of the branch in organising a new British exhibit after the fire at Brussels will be fresh in the memories of many, and with regard to this, as well as the portions of the display that were unharmed, we understand that the results have been very satisfactory to many of the exhibitors. The awards at Brussels also, considering the number of firms exhibiting, show an unprecedented proportion of prizes to British exhibitors.

In addition to Brussels, the Exhibitions Branch of the Board of Trade has also taken part in an exhibition at Vienna, and in the four distinct exhibitions forming part of the centenary celebrations at Buenos Aires. It is noteworthy that in the Railway and Land Transport Exhibition forming one of the latter Great Britain controlled more than half the entire exhibit area.

Junior Institution of Engineers.—At the annual general meeting of this Institution, held recently, the retiring Chairman, Mr. Geo. T. Bullock, presiding, the Council's report was presented. The total membership at the end of the session was 1,089, and the report makes reference to nine ordinary meetings, at which the average attendance was 114; a large number of visits have been paid to engineering works, and special reference was made to the summer meeting in Ireland, when works in and around Dublin and Belfast were seen. The gatherings, which take place on Friday evenings at the rooms of the Institution, 39 Victoria Street, Westminster, have been well attended, informal discussions on matters of interest to the members having taken place; the library and other features of interest were alluded to, and reference made to the acceptance of Sir J. J. Thomson, F.R.S., of Cambridge University, of the position of President for the ensuing year. The ballot for officers and members of Council for the new session resulted in the election of Mr. J. Wylie Nisbet, M.I.Mech.E., as Chairman, and Messrs. B. E. Dunbar Kilburn and S. Bylander as Vice-Chairmen, and Messrs. A. H. De Ritter, J. H. Pearson, H. P. Philpot, and W. A. Tookey, as members of Council succeeding those retiring by rotation.

ELECTRIC LIGHTING FOR THE PALLADIUM THEATRE OF VARIETIES

WE understand that this building in Argyle Street, Regent Street, which is said to be the largest of its kind in London, will, when complete, also be second to none in regard to the lavishness of its illumination and the handsome designs of the hand-made electric fittings. Whilst certain minor details of the lighting are still undecided, it can be stated that the fittings in the auditorium will be chiefly of the Georgian type in a dull brass finish. The main ceiling will have two 50-light electroliers, eight 10-light electroliers, and other fittings; corresponding designs of brackets, three-light pendants, and ceiling fittings will be employed for the fronts, ceilings, and walls of the various circles. The stalls, saloon, lounge, and landings will be lighted by electroliers and other fittings of specially heavy Georgian design, whilst fittings of Louis XV. style in gilt and crystal have been selected for the dress circle saloon. The floats, battens, hanging lengths, proscenium lights, bunches, &c., for the stage lighting are all of the most modern types, and efficient provision has been made for the lighting of the passages, dressing-rooms, and other similar situations. The fittings for the interior allow for an aggregate of approximately 1,200 lights, whilst a large number of special signs and arc lamp brackets will be mounted on the exterior. "Tantalum" and "Onewatt" lamps and Siemens' arc lamps will be employed exclusively for the lighting, and the whole of the fittings are being supplied by Messrs. Siemens Bros. Dynamo Works, Ltd. (Fittings Department, Tyssen Street, Dalston), whose own artist is responsible for the accepted designs.

THE INSTITUTION AND LOCAL SECTION MEETINGS

THE opening meeting of the 1910–11 session of the Institution of Electrical Engineers will be held at the new home, Victoria Embankment, London, on Thursday, November 10th, at 8 p.m., when the premiums awarded for Papers read or published during the session of 1909-10 will be presented, and afterwards the President, Mr. S. Z. de Ferranti, will deliver his inaugural address. The meetings will be held fortnightly as usual.

The Manchester Local Section commenced its meetings on October 28th, and an abstract of Mr. J. S. Peck's inaugural address will be found on another page of this issue. The Manchester Section stands alone in holding more than one meeting a month, but the session at Manchester ends earlier than at any of the other Local Sections except Newcastle-on-Tyne, in March. The November meetings at Manchester will be held on the second and fourth Tuesday of the month, but this day is not adhered to throughout the session. The following is the programme:—November 8th, "Irregularities in the Rotating Field of the Polyphase Induction Motor," by C. F. Smith; November 22nd, "The Conditions affecting the Life of Electrical Machinery," by A. B. Mallinson; December 6th, "The Methods of Braking in Electric Winding Engines," by Dr. E. Rosenberg; December 20th, "Merz-Price and other Discriminative Protective Apparatus for A.C. Circuits," by K. Faye-Hansen and G. Harlow; January 17th, 1911, "Electric Heating as applied to Cooking Apparatus," by Harold Gray; January 31st, "Breaking High and Low Potential Circuits," by A. G. Collis; February 14th, "Pertinent Features in the Insulation of Electrical Machines," by A. P. M. Fleming and R. Johnson; February 24th, Annual Dinner; February 28th, "Heating Effects in Cables," by C. J. Beaver; March 14th, "Electricity Meters," by H. A. Ratcliff and A. E. Moore; and March 28th, Annual General Meeting. Lecture by Prof. J. A. Fleming.

The Birmingham Local Section holds its meetings on the second or third Wednesday in the month, and commences on November 16th. At Dublin, Thursday is the meeting day, the first being on November 10th; whilst the Glasgow Local Section usually meets on the second Tuesday of the month, and commences on November 8th. At Newcastle the next meeting is on Monday, November 21st; and the Yorkshire Section meets on November 16th at the Leeds University, but the meetings of this Section alternate between Leeds and Sheffield.

Embezzlement.—J. Downes, formerly Traffic Superintendent of the Lanarkshire Tramways Co., was sentenced to three months' imprisonment at the Glasgow Sheriff's Court last week for the embezzlement of about £550, which had been lodged with him by applicants for shares in respect of the Company's recent tramway extensions.

Digitized by Google

THE PRICE OF CURRENT FOR TRAMWAYS

THE arbitration to determine the price which the Paisley District Tramways Co. shall pay the Paisley Corporation for electrical energy was concluded on Wednesday and Thursday last week. The price now paid by the company averages 1·4d. per unit, which it has been paying for the last seven years under the terms of the Act of Parliament authorising the tramways. The period for revision has now arrived, but the Corporation resist any reduction in the price, and the matter has been referred to Mr. Robert Hammond to arbitrate upon. The previous proceedings were reported in our issue for October 13th and 27th.

The remaining witnesses were Mr. James Townley, the station engineer at Paisley, and Messrs. S. L. Pearce (City Electrical Engineer, Manchester) and W. M. Mordey. It may be remembered that Mr. Pearce has been one of the representatives of the Incorporated Municipal Electrical Association in the conference with the Municipal Tramways Association to settle a basis upon which charges for tramway energy should be formulated. This arbitration has attracted a considerable amount of attention, not because in itself it involves any great amounts either of money or energy, but on account of the fact that Mr. Hammond's award will come at a moment when considerable dissatisfaction is being expressed all over the country at the charges made for tramway energy, both by tramway companies taking a supply from municipalities and by tramway committees who are supplied by electricity committees.

As already stated, the present charge at Paisley is an average of 1·4d. per unit; the company suggest a substitution of a new sliding scale for the present one, which will reduce the average price to 0·56d. per unit. The Corporation say that if this latter were adopted, it would not cover the present works costs, and would mean a loss of revenue amounting to £4,000 annually, whereas the whole undertaking only brings in about £300 profit after meeting capital charges. Mr. Pearce and Mr. Mordey, each working at the problem from different points of view, state that the total costs at Paisley for tramway purposes must be put at 1·3369 and 1·321 respectively, whilst, if the costs of 1904—when the tramway load was first added—were taken, and the extra cost of generating the tramway units adopted as the basis of calculation, the charge would be 1·02d., after adding capital charges. But both think the latter is the wrong method.

With regard to the amount of plant available for tramway purposes—and the price is necessarily affected by this, owing to the capital charges—Mr. Pearce did not think a 750-kw. and two 500-kw. sets, as well as a 200-kw. motor generator, which is partly used for tramways, excessive for a load of at most 850 kw., although he admitted he was unable to point to an instance in which the proportion of plant to load was so great. Likewise, Mr. Mordey had no fault to find on this ground, but in his speech for the company Mr. Talbot, K.C., ridiculed the idea of having to pay the capital charges on 1,720 kw. of plant when the whole load on the station, tramways, power, and lighting had never yet exceeded 1,312 kw. A point strongly relied on by the Corporation, however, is that the Corporation are under financial penalties should a failure of supply occur, and that the large reserve of plant is necessary on this account.

A curious feature in Paisley is that, instead of being able to induce the few large works there to come on to the mains, these are actually leaving the Corporation supply and putting in private generating plants. Taking advantage of this unfortunate state of affairs, Mr. Balfour Browne, K.C., for the Corporation, argued that the arbitrator must not proceed on the lines of a possible decrease in the works costs during the next seven years, as an increase in the power load could not be relied upon. He said the only basis of calculation must be the present cost to the Corporation, having in view the special plant installed for tramway purposes, and he hinted that if the arbitrator dealt with the question in any other way, he would have to ask him to state his award in the form of a special case for the Court of Sessions. He also contended that any question of the price at which the company could purchase from another authority or could generate for themselves must be put on one side, as they were bound by Act of Parliament to take their supply from the Corporation. The fact that the capital expenditure per kw. at Paisley, viz., £38, compared with such large towns as Glasgow and Manchester was also emphasised.

In his reply for the company, Mr. Talbot, K.C., twitted the Corporation upon having kept the Clyde Valley Power Co. out of their area originally by the argument that they could supply as cheaply as the company, and yet they now frankly confessed they could not, because the company were actually supplying the tramway company at 0·65d. per unit, and would supply on these terms to the whole of the tramways if they were allowed. He claimed that the Corporation should be kept to the argument they put before Parliament. He also wanted to know how it was, if the Corporation were making a profit on power supply at 1·19d. per unit, they would lose if the tramway supply were charged at less than 1·4d. per unit. The tramway company were entitled to the same terms as a power user taking the same quantity, but the evidence was that power users taking less were charged a lower rate.

Mr. Hammond reserved his award.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

OSRAM LAMPS.—A brightly coloured card which is being issued by the General Electric Co. (67 Queen Victoria Street) represents the exterior of a brilliantly lighted first class railway carriage. Opening the door of this, we are met with a reproduction of the well-known Comet Osram poster and an inscription on the inside of the door to the effect that 1st class light can be obtained at 3rd class cost by using Osram lamps. A larger reproduction of the poster forms the cover of a folder pointing out the advantages of these lamps, and both, which are certainly very effective, are arranged so that the name and address of any dealer can be added.

ALUMINIUM WIRE AND ROD.—A leaflet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, London, E.C.), contains a comparative table of the physical, mechanical, and electrical properties of aluminium and copper, and tables of dimensions, weight, resistance, and current-carrying capacity of aluminium rod for switchboard and machine connections, and of aluminium wire, both hard-drawn and annealed.

DRUM TYPE CONTROLLERS.—The British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester), has just issued a new catalogue of reversing drum type controllers for series shunt and combined wound motors, cranes, hoists, winches, machine tools, textile and printing machinery, general industrial work, &c. These controllers are of the single-handle type, built on the metal and mica principle as supplied to the British Admiralty. Each part is standardised as a detachable unit in itself, so that replacements and repairs may be effected from stock parts. The parts are so arranged that the controller is easily opened up for inspection and cleaning. The drum rings, finger bases, and switch parts are clamped on to mica insulated steel bars producing a rigid and fireproof construction, withstanding severe climatic conditions without deterioration.

STORAGE BATTERIES.—A new leaflet from the Hart Accumulator Co., Ltd. (Stratford), gives prices of their lighting type cells, with illustrated particulars of the construction of the plates, which combine the advantages of the Planté and Faure types, and of the Hart patent non-corrosive terminal.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

METAL FILAMENT LAMPS.—The latest list of "Mazda" lamps has an attractive coloured cover reproducing the idea of the British Thomson-Houston Co.'s well-known poster in which the sun, his only rival, is seen peeping round the earth at a Mazda lamp. Full particulars are given of all sizes of these metal filament lamps, and they are rated throughout in British candle-power. The 200-volt lamps are now made in sizes down to 22 c.p. (32 watts), and the smallest 100-volt lamp is 14 c.p. (17 watts). Smaller lamps of lower voltage are also made, and the large sizes range up to 360 c.p. (400 watts). Special 24-volt train-lighting lamps are also supplied, and a series of candle lamps with miniature holders has been prepared for running two or three in series on the ordinary supply voltages for the conversion of candelabra fittings from carbon to metal filament lamps. Other special lamps include 6-watt 5-c.p. 20 to 25 volt sign lamps and Magda automobile lamps. It is important to notice that the company undertakes to defend all claims in actions for infringement of British patents in respect of the sale or use of Magda lamps.

INCANDESCENT LAMPS.—New pamphlets have lately been issued by the Rugby Lamp Co., Ltd. (London agents, J. L. Cateaux and Co., 10 Bush Lane, E.C.), giving prices of the "Rugby" metal filament and carbon lamps made at the company's works at Lower Hillmorton Road, Rugby. The metal lamps are supplied in sizes up to 55 watts for all ordinary voltages, and down to 32 watts at 200/260 volts and 17 watts at 100/135 volts low voltage, and candle lamps are also made.

LANTERNS AND REFLECTORS.—Two new cards from Siemens Brothers Dynamo Works, Ltd. (incandescent lamp and fittings department, Tyssen Street, Dalston, N.E.), deal respectively with the new Holophane stilette reflectors, indicating for which size of tantalum and "one-watt" lamps each shade is suited, and the form of outside weather-proof lantern illustrated on page 651 of ELECTRICAL ENGINEERING of October 13th.

ELECTRICAL VEHICLES IN AMERICA

IN connection with the encouragement now being given to the use of electrical vehicles in London by the Marylebone Electricity Department, who are offering to supply current at special rates for battery charging (see ELECTRICAL ENGINEERING, October 27th, page 685), it is of interest to note the activity of the electrical vehicle interests in America. The issue of the *Electrical World* (New York) for October 20th, for example, contains no less than five articles dealing with the subject. One of these is an account of the first annual Convention at New York of the recently formed Electric Vehicle Association of America, to which is affiliated several local organisations with the same objects. The President in his address dwelt on the necessity for standardisation of voltages, charging arrangements, and equipment, and spoke of the improvement in the behaviour of batteries. A paper was read on "Problems Involved in Advancing the Use of Electric Vehicles," by Mr. W. P. Kennedy, and the most recent performances of the Edison battery were recounted by Mr. F. L. Dyer. A paper on the relation of the central station to the electrical industry was read by Mr. T. A. Furguson, and the question of heavy electric vehicles was dealt with by Mr. Hutchings. Another address was recently delivered before the Electric Club of Chicago on the increasing importance of the electric vehicle.

A short article in the same issue describes arrangements for vehicle battery charging in Detroit, where there are about 400 electric pleasure vehicles and 25 large vans, and the cost of current to the owners works out at about 2½ cents (1¼d.) per unit. In Toledo, according to another article, there are 700 electric vehicles (for a population of about 170,000). Current is here sold to the large garages at 2·5 to 3 cents per unit (1¼d. to 1½d.). Private garages are charged 5 cents (2½d.).

In the fifth article a new type of accumulator omnibus is described, which is the first to be equipped with Edison batteries. This seats 30 passengers on a single deck, and is intended to run 56 to 75 miles on one charge. The weight of the vehicle is said to be under 8,000 lbs., of which 20 per cent. is that of the battery, and it is propelled by two 7 h.p. motors.

RE-ORGANISATION OF THE L.C.C. TRAMWAY STAFF

CONSEQUENT upon the resignation of Mr. J. H. Rider from the post of Chief Electrical Engineer to the Tramways Department, the Highways Committee of the London County Council proposed certain rearrangements of the staff (effecting a saving of £300 per annum), which were duly authorised at the meeting of the Council on Tuesday night.

As at present organised there is an official in charge under the Chief Officer of Tramways of each section of the department, but there is no one in the position of deputy to take charge of the whole department in the Chief Officer's absence, and to relieve him of any of the vast amount of detailed work which the position involves. Mr. J. K. Bruce, the present Traffic Manager, is now appointed to the post of Deputy Chief Officer at his present salary of £950 per annum, rising on April 1st next to £1,000 per annum. In order to fill the vacancy thus created in the Traffic Department, a Traffic Assistant is to be appointed at a salary of £600 per annum, and applications for this appointment will be invited by public advertisement.

With regard to the electrical work of the department, the Committee think, now that the Greenwich power-house is practically completed and the electrical equipment of the lines is well advanced, that the post of Chief Electrical Engineer should be abolished, and that Mr. J. Shepherd, at present Assistant Electrical Engineer with a salary of £600 per annum, should be promoted to Electrical Assistant in the Tramways Department to take charge of the electrical section, at a salary of £800 per annum. In addition, the salary of Mr. W. P. Farquharson, the General Assistant, is to be increased from £500 to £600 per annum.

THE PREPARATION OF RUBBER

MESSRS. DAVID BRIDGE & CO., Castleton, Manchester, inform us that they have been awarded a grand prix at the Brussels Exhibition for their exhibit of rubber preparation machinery in connection with the Colonial section of the Exhibition at the Parc de Tervueren. The firm had a complete installation in the Exhibition itself, and in the basement they had a second plant actually at work in which the raw latex from the trees was coagulated by the Da Costa patent smoking system, put through the various machines, and prepared ready for manufacture in crêpe, sheet, and block form. The various methods of extraction and cleansing of wild rubber were also demonstrated.

The Da Costa process is designed to supersede the old native method of coagulation by smoking, and an outline of its nature may be of interest.

The latex, being brought from the field, is strained if it is found to contain mechanical impurities, and then poured into the coagulating tanks. Steam is meanwhile being raised to about 30 to 35 lb. in the boiler, forest woods alone being used for fuel. On to the burning wood in the furnace are then thrown green palm leaves, nuts, or any green twigs of tropical trees, the distillation of which produces acetic acid, whilst the fumes of the green foliage will be found to contain creosote to some extent. These fumes are accumulated in a special receptacle after being cleared of cinders, &c., and they are then forced into the coagulating tanks by a steam injector. The force of the steam violently agitates the latex, and during this operation every particle of it is reached by the smoke. In about ten minutes, or rather more if the quantities to be dealt with are very large, the caoutchouc globules coagulate and separate from the lyes and rise to the surface. The coagulating substance, after being allowed to cool off in the tanks, is immediately cut up into suitable sizes and passed through the macerating, crêping, and sheeting machinery. With the Da Costa system it is not necessary to subject the newly coagulated rubber to excessive maceration, because it does not contain strong manufactured acetic acid. Crêping or sheeting is only necessary for quick drying. After being dried in an open and well-ventilated room or steam-heated drying chamber, or by the vacuum drier, the rubber is ready for exportation, unless it is required to be blocked, when it can be taken to a small press and turned out in the shape of flat block rubber.

Messrs. David Bridge & Co. have for long specialised in rubber-preparing machinery. A handsome souvenir of their exhibit at the Brussels Exhibition illustrates a number of types of machines both for the preparation of rubber and for its treatment by manufacturers, the latter class including hydraulic vulcanising, rubber belt presses, calenders, grinders, mixers and sheeters, hose-making machines, rubber-proofing machinery, cable-making machinery, lead presses, and examples of the application of their well-known friction clutches.

AN OSRAM ADVERTISING DEVICE

THE accompanying illustration represents a new translucent paper shade, which the General Electric Co. (67 Queen Victoria Street) are distributing among contractors throughout the country to call attention to Osram lamps. These shades can

NEW OSRAM ADVERTISING SHADE.

be attached to any lamp-holder with the usual shade ring, and from the brightly coloured sample with which we have been favoured we can say that they are certainly most effective.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published October 27th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

22,823/09. **Locking Lamp Holder.** C. DAMEY (London). The liner of the holder has a bell-shaped mouth and two holes instead of the usual bayonet slots. The lamp cap is provided with plunger pins pressed outwards by spiral springs within the cap. On inserting the lamp, the pins are pressed inwards by the bell-shaped mouth, and the lamp is then turned until the pins coincide with the holes, when they spring out and lock the lamp. A special tool is provided for pressing in the pins in order to remove the lamp. Six figures.

24,437/09. **Tungsten Filaments.** E. RUHSTRAT. (Goettingen, Germany). In order to obtain finer and stronger filaments by such processes in which the tungsten is mixed in the form of a powder with a binding material and then squirted, the tungsten is reduced to a very fine powdered state by first heating to a temperature higher than its melting-point in an arc, and then suddenly cooling it. The product is extremely brittle, and can be ground so fine that it approaches the colloidal state. One figure.

24,566/09. **Enclosed Flame Arc Lamp.** H. HIRST and A. E. ANGOLD (Salford). In a vertical carbon enclosed or semi-enclosed flame lamp the upper carbon is surrounded by a tube of sufficient diameter to produce a good upward draught, and this tube is surrounded by a second fixed tube, there being communication between the tubes at top and bottom. The inner tube is automatically fed downwards, so that its mouth is always just above the arc. The condensed fumes from the arc are deposited on the outer tube. Two figures.

824/10. **Armature Cores.** CROMPTON & CO., LTD., J. C. MACFARLANE and H. BURGE (Chelmsford). To assist cooling, the radiating surface of the armature is increased by using core-discs of two different diameters, one slightly greater than the other. By threading these discs on alternately, the larger ones give radiating surface at the sides as well as at the edges. Two figures.

2,983/10 and 3,610/10. **Tungsten Filaments.** WESTINGHOUSE METALLFADEN-GLUHLAMPENFABRIK GES. (Vienna). The first specification describes a method of decarbonising tungsten filaments, consisting in heating a large number together in a vacuum furnace to a very high temperature. An electric resistance furnace for this purpose is described. It is stated that with a good vacuum and a temperature of about 1,200° C. the carbon content can be reduced to 0·04 per cent. The second specification claims the process of adding a quantity of pure powdered tungsten (from 40 to 50 per cent.) to a paste of tungsten dioxide and binding material before squirting. Strong filaments can be produced from such a mixture without raising the temperature above 1,000° C. during the reduction of the dioxide.

4,098/10. **Geissler Tube Lamp.** E. URBAIN, A. FEIGE and C. SCAL (Paris). A high-efficiency lamp consists of a Geissler tube containing phosphorescent sulphides painted on the inside surface of the tube or fixed on a support. The tube may contain a rarefied gas, helium being suitable. The sulphide is excited by the action in the tube, and emits a white light.

5,561/10. **Enclosed Flame Arc Lamp.** T. L. CARBONE (Berlin). A globe for enclosed flame lamps of the converging carbon pattern has a small hemispherical lower portion close to the arc, and an upper portion made in the shape of a double umbrella extending laterally over the periphery of the lower chamber. The hemispherical part keeps hot and clear while the fumes are condensed in the cool, upper annular chamber, which thus acts also as a reflector. One figure.

6,895/10. **Long Distance Telegraphy.** A. PETERSEN and G. SEM (Christiania). Two or more microphones are used, each having a separate battery of cells in series with it. The several sets of microphones and cells are connected in parallel with the primary of the induction coil. One speaking trumpet leads to all the microphones. One figure.

Opposition to Grant of Patent

12,844/09. **Magneto Massage Machine.** B. SEACOMBE. The Comptroller has given a supplementary decision granting this patent on condition that certain amendments are made. The patent was refused in the first place as the result of opposition. It describes an apparatus consisting of a roller with a corrugated metal surface, driving a magneto-generator through a gear train. By means of a contact-making device, an intermittent current is passed from the roller through the part being massaged.

18,494/09. **Vacuum Cleaner.** T. WIEDERMANN and J. H. TEMPLIN. Opposition has been entered to the grant of this patent. It covers a self-contained vacuum cleaner comprising a single-acting diaphragm pump driven by an electric motor.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: NEU, 23,014/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: MAVOR and MAVOR & COULSON, LTD. [A.-C. power-plants] 27,478/09; SIEMENS-SCHUCKERTWERKE GES. [A.-C. power transmission] 3,117/10.

Dynamos, Motors, and Transformers: HEYLAND [Single- and polyphase motors] 22,932/09; LEAKE [Motor control] 23,217/09; STERN [Windings for A.-C. motors] 23,553/09; LIPPELT [Machines] 23,756/09.

Heating and Cooking: PLETTS and BELL [Cooking and heating apparatus] 23,818–9/09; COOPER [Heat-insulating composition for ovens] 25,084/09.

Incandescent Lamps: VITANOFF [Portable lamps] 23,808/09.

Instruments and Meters: LANCASTER [Prepayment meters] 20,638/09.

Storage Batteries: ACCUMULATEURS TUDOR SOC. ANON. [Packing charged negative plates] 18,398/10.

Switchgear, Fuses, and Fittings: SIMPSON [Chain pendant fittings] 22,988/09; HORSTMANN and EDGAR [Time switches] 23,161/09; MALEY [Resistances] 23,216/09; HARRISON [Supports for lamps] 23,980/09; DEY [Motor controllers] 24,208/09; REASON MANUFACTURING CO. [Automatic flash-light device] 30,000/09; BROOKS and ALSTON [Switches] 800/10.

Telephony and Telegraphy: THOMPSON (*Ges. für Drahtlose Telegraphie*) [Apparatus for strengthening weak electrical impulses] 10,210/10; O'HARA [Sanitary telephone mouthpieces] 15,448/10; EISENTEIN [Oscillation generator for wireless telegraphy] 16,356/10.

Traction: WHITELEY [Tramcar life-guards] 30,457/09; AIKMAN [Automatic signalling] 12,172/10.

Miscellaneous: BARNES and JENSEN [Lifts and hoists] 4,715/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: GES. FÜR MASCHINEN- UND METALL- INDUSTRIE, 22,841/10.

Distribution Systems, &c.: GEB. SIEMENS & CO. [Fireproof conductors] 19,866/10.

Electrometallurgy: MASSIP [Electric steel furnaces] 22,777/10.

Incandescent Lamps: WESTINGHOUSE METALLFADEN GLUHLAMPENFABRIK GES. [Metal filament lamps] 22,852/10.

Switchgear, &c.: DASSENOY [Starter for synchronous motors] 23,174/10.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

24,617 of Nov. 4th, 1896. **Sectional Water-tube Boilers.** W. FAIRWEATHER (*Babcock & Wilcox Co., U.S.A.*). This patent covers means for securing circulation in the tubes, and a construction enabling the boiler to be suspended and providing for the longitudinal expansion of the tubes. The first of the thirteen claims is for "a transverse water-box connected to upright columns which support said box and to front headers and drum by short tubes or nipples, whereby the boiler is suspended at the front to said box and columns."

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: ELEKTRICITÄTS A.-G. VORM. W. LAHMEYER & CO. [Polyphase commutator machines] 14,317/05; L. J. HUNT and SANDYCROFT FOUNDRY CO. [Variable-speed induction motors] 14,401/05.

Heating and Cooking: A. VOELKER [Heating elements] 14,256/05.

Instruments, &c.: C. H. HUTCHINSON [Prepayment meters] 14,456/05.

Switchgear, &c.: C. G. GARRARD and FERRANTI, LTD. [Reverse current and overload relays] 15,403/03; VERITYS, LTD., and A. E. GOTT [Fuse and distribution boxes] 15,646/04; SIEMENS BROS. & CO. (*Siemens-Schuckertwerke Ges.*) [Regulating switch gear for transformers and storage batteries] 14,210/05; C. RUZICKA [Resistance units] 14,400/05.

Traction: G. M. HARDINGHAM (*Kelten & Guilleaume Carlswerk A.-G.*) [Rail bonds] 12,466/00.

Miscellaneous: K. J. RAMSPECK [Electromagnet coin sorter] 14,176/01; HELE-SHAW PATENT CLUTCH CO. and W. WALLACE [Reversing gearing] 15,352/04; W. P. THOMPSON (*Maschinenfabrik Augsburg, Nürnberg*) [Gas tester] 15,706/04; E. E. RIETER-BODMER [Insulating material] 15,795/04; J. J. RAWLINGS and RAWLINGS BROS. [Conduit bending device] 14,372/05.

Digitized by Google

LOCAL NOTES

Acton: *Proposed Sale of Electricity Undertaking.*—A meeting of ratepayers has protested against the manner in which the Council propose to sell the electricity undertaking to the Metropolitan Electric Supply Co., and the Board of Trade, the Local Government Board, and Mr. H. Neild, M.P. for the district, are to be asked to use their efforts to prevent the Bill authorising the transfer being passed by Parliament.

Bournemouth: *Conduit System Abandoned.*—The report of the Tramways Manager in favour of substituting the overhead system for the conduit system in the centre of the town (ELECTRICAL ENGINEERING, May 12th, 1910), which had already been adopted by the Tramways Committee, was passed by the Corporation last week.

Bradford: *Smoke Prevention.*—A deputation of the Bradford Electricity Committee paid a visit to the Glasgow Smoke Exhibition a short time ago, and have now reported to the Committee. The deputation think it would be advantageous if the Bradford Gas and Electricity Departments combined to hold a similar exhibition.

Brighton: *Proposed Tramway Running Powers.*—The recommendation of the General Purposes Committee not to agree to the proposal to allow tramcars from Worthing to run over the Corporation lines was adopted at the Council meeting last week. The proposal was to construct tramways from the terminus of the Corporation lines through Hove and on to Worthing, the work being carried out by the British Electric Traction Co.

Price of Tramway Energy.—A joint Sub-Committee of the Lighting, Tramways & General Purposes Committee, which has been considering the price to be paid by the Tramways Department to the Lighting Department for electrical energy, has decided to reduce it from 1·35d. to 1·2d. per unit.

Burnley: *Speed on Tramcars.*—An inquiry was held last week by the Board of Trade concerning an application by the Corporation to increase the speed on various sections of the electric tramways to a maximum of 16 miles per hour.

Devonport: *Through Tramway Facilities.*—The Devonport and District Tramways Co. have asked the Council to appoint a small Committee to discuss the question of through running.

Eccles: *Charges for Electricity.*—The Council have decided as an experiment to supply electricity to the tenants of a selected block of cottages at a charge of 6d. per week. It is estimated that the actual cost to the Corporation will be 4d. per week per tenant. The cottages in question contain three and sometimes four lights.

Glasgow: *Tramway Extensions.*—The Kirkintilloch Council are again urging the Corporation to extend their tramways to that district.

Halifax: *Proposed Tramway Extensions.*—The Corporation will apply for powers to construct tramways to Staniland, Elland, and Ripondon on condition that the respective District Councils will guarantee an annual contribution of £300 per route mile. It is also proposed to extend the tramways to Wainstalls, and to seek powers to run trolley omnibuses in Queen's Road.

London: *Holborn: Street Lighting.*—The Metropolitan Electric Supply Co., the County of London Electric Supply Co., and the Gas Light & Coke Co. are putting in a competitive scheme of street lighting in Gower Street in order to assist the Holborn Borough Council to come to a decision upon the question of street lighting generally, concerning which there has been considerable controversy recently.

Bermondsey: Competition with Companies.—The Council have decided to apply for a Provisional Order authorising them to supply electricity in the parishes of St. Olive, St. Thomas, St. John, and Horsleydown. At present both the County of London Electric Supply Co. and the London Electric Supply Corporation are supplying in the district, and already three applications by the Council for similar powers have been refused by the Board of Trade, partly on the ground that competition of this character is not permissible under the Electric Lighting Acts, and partly for the reason that the companies are supplying in some cases more cheaply than the Borough Council is in its own district. The proposal to make a further application was passed by a vote of 28 to 23.

Hammersmith: Underground Wires.—The Council have refused their consent to the erection of an overhead telegraph line in Ravenscourt Park.

Marylebone: Charge for Radiators.—With reference to our article on the rapid development in the installation of radiators in Marylebone, the Electricity Committee now recommend that the annual charge of £2 2s. on the telephone system be abolished, and only the charge of 1d. per unit for energy consumed imposed.

Middlesex: *Tramways.*—The report of the Light Railways & Tramways Committee for the year to March 31st shows a capital expenditure to date of £1,672.440. The traffic receipts from the Middlesex tramways during the year were £326,441, and the rents received have been sufficient to pay the full interest on the capital expenditure.

North Berwick: *Electric Lighting.*—An agreement has been completed with Messrs. Crompton & Co., Ltd., for the erection of an electric power-house.

Scarborough: *Proposed Stoppage of Tramways.*—A Board of Trade inquiry was held at Scarborough last week in connection with the proposal of the Scarborough Tramways Co. to suspend their service altogether during the winter months. It was stated that during 1909 the company lost over £2,000, that nothing had been set aside for depreciation since the commencement, and that no dividends have been paid. The Corporation appear to prefer that the undertaking should be abandoned altogether rather than that the cars should be run during the summer months only. Mr. F. E. Gripper, on behalf of the company, said that whereas in the winter the running costs were 8·5d. per car mile, the total receipts had never been more than 5·5d. per car mile. If the Board of Trade refuses to allow the winter service to be discontinued, Mr. Gripper said that the company would be obliged to close down the trams altogether.

Stockton: *Suggested Tramway Extensions.*—The local Chamber of Commerce propose to wait upon the Town Council to suggest extensions of the tramways in various directions. The Middlesbrough, Stockton & Thornaby Tramways Co., of which Sir Clifton Robinson is Chairman, are disposed to consider the proposal if an extension of the present purchase period is conceded.

Torquay: *The Dolter System.*—In view of an arrangement between the Corporation and the tramway company to substitute overhead traction for the Dolter system, the Board of Trade have decided to renew the licence for the Dolter system until the conversion has taken place.

Willesden: *Electricity Accounts.*—The accounts of the electricity undertaking for the year to March 31st show a net profit, after meeting capital charges, of £1,600. The number of units sold for all purposes was 2,324,689 against 2,227,086 in the previous year. The load factor has improved from 17·35 per cent. to 19·02 per cent. The total costs, including interest and sinking fund, were 2·680d. against 2·741d.

Worthing: *Management of Electricity Undertaking.*—The Electricity Committee have reported that the allegations as to the mismanagement of the electricity undertaking, to which reference was made in our last issue, are absolutely without foundation. Consequently it has been decided not to hold an inquiry as was asked for by the Electrical Engineer. Mr. G. Porter, the Borough Electrical Engineer, received considerable praise from the Electricity Committee for the manner in which he carries out his duties.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

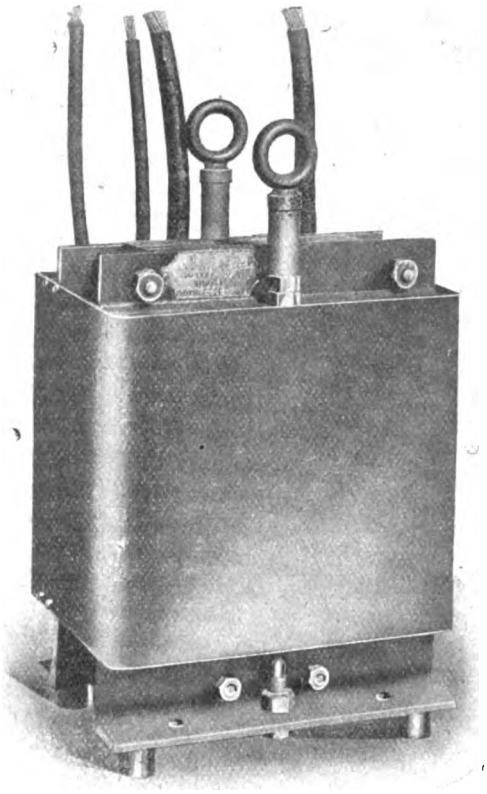
Barking.—An application is to be made for a loan of £11,000 for extensions at the electricity works.

Bispham.—Sanction has been received for the erection of an electricity works in Redbank Road.

Gloucester.—A loan of £14,000 for electrical extensions is to be applied for.

Greenock.—Extensions involving an expenditure of £16,000 are contemplated.

Peterborough.—A loan of £2,000 has been sanctioned for electrical extensions.



Portrush.—The Council have under consideration a report by Messrs. Miller, Wilson & Pegg, of Belfast, for the erection of an electric power station at an estimated cost of £5,475.

Portsmouth.—A loan of £20,586 has been sanctioned for electrical extensions.

Sittingbourne.—Power-house at the Sittingbourne Paper Mills.

Stoke-on-Trent.—In order to provide duplicate mains for certain large power users, another feeder is to be laid from the Burslem works at an estimated cost of £1,000.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Whiteley's new store. Architects, Messrs. George Belcher, R.A., and J. J. Joass.

Extensions of Avenue Telephone Exchange. H.M. Office of Works, Storey's Gate.

Fulham Empire. Mr. Oswald Stoll.

New schools or extra accommodation for additional children are proposed by the London County Council in Stepney, Poplar, Greenwich, Lewisham, Camberwell, and Battersea.

Alteration of Nos. 42 and 43 Cranbourne Street, Westminster, into residential flats.

Coroner's Court at Poplar.

New Court-house at Hendon.

PROVINCES.

Aberdare.—Central Free Library.

Acton.—Pavilion at Isolation Hospital.

Ashington.—New municipal buildings.

Barnsley.—Extension to Beckitt Hospital.

Birmingham.—New church at Perry Bar. Birmingham Mission.—New police station in Allison Street.

Bishop Auckland.—New post office. H.M. Office of Works, Storey's Gate, London.

Blackpool.—Reconstruction of Opera House in Winter Gardens.

Bootle.—Balliol Council Schools. Specifications from Borough Electrical Engineer.

Bradford.—Rebuilding of premises in Thornton Road. Architect, Mr. A. R. Hill, 23, Piccadilly, Bradford.

Bridgend.—New Council Offices.

Buxton.—Cottage hospital.

Cardiff.—Technical school in Cathays Park.

Christchurch.—New Workhouse Infirmary.

Colwyn Bay.—New Drill Hall.

Darlington.—Cinematograph theatre. Darlington Cinematograph Co.

Deal.—New Bank Premises.

Dover.—Electric theatres at Dover, Deal, and Folkestone. Local Company.

Dundee.—Additions to Fever Hospital.

Edinburgh.—Four-storey building at the Vennel. Salvation Army.

Additions to married quarters at barracks in Johnstone Terrace. Alterations to Board School in Lauriston Place.

Exeter.—Extensions to Sanatorium. Borough Surveyor.

Folkestone.—Considerable additions to Grand Mansions, The Leas.

Frome.—Manual Instruction Centre for the County Council.

Guildford.—Alterations and additions to "Cannon Inn." Friary Brewery Co.

Harwich.—Proposed Technical Institute.

Hull.—Alterations to Park Street Barracks.

Leicester.—New elementary school in Hinckley Road.

Liverpool.—Conversion of Seafield House into Asylum. Lancashire Asylums Board.

Loughborough.—St. Peter's Church.

Maidstone.—Proposed extension of West Kent Hospital.

Manchester.—Conversion of Institute at Droylsden into public offices, &c. Mr. C. Hill, Council Office, Droylsden.

Northampton.—Girls' secondary school.

Plymouth.—New Territorial buildings at Millbay Barracks.

Radcliffe.—Proposed new buildings at Infirmary.

Ross.—Secondary school for boys and girls. Architects, Messrs. Ashton & Small.

St. Anns-on-Sea.—Proposed Cottage Hospital. Mr. J. T. Clifton.

Scarborough.—Hospital for treating phthisis cases.

Sheffield.—Girls' club and concert hall in Solly Street.

Stockport.—New Carnegie Central Library.

Swansea.—Factory and stores, New Orchard Street. Mr. Emmanuel Thomas.—Twenty-four houses, Pant Street. Mr. D. Austin.

Wakefield.—Theatre. Wakefield Theatre, Ltd.

MISCELLANEOUS

Canada.—An application is to be made for the incorporation of a company to construct a railway between Niagara, Welland, and Lake Erie, says the *Board of Trade Journal*.

Dunoon.—Some private promoters have under consideration the construction of a tramway scheme in the district.

Hull.—An important scheme of tramway extensions is under consideration by the Tramways Committee.

London: *London County Council.*—The construction of tramways in Hammersmith Broadway for the purpose of linking up Putney and Harlesden is to be put in hand at an estimated cost of £2,000.

Rochdale.—Meters are to be fitted to fifty-nine cars.

Southend.—Application is to be made for powers to extend the tramway system considerably.

Wakefield.—The Wakefield & District Light Railway Co. require various stores, including electric lamps and fittings, overhead fittings, &c. The Manager, Wakefield.

TENDERS RECEIVED AND ACCEPTED

Glasgow.—The tender of the Lahmeyer Electrical Co. for copper rail bonds has been accepted by a Sub-Committee of the Works and Stores Committee.

Sheffield.—The tender of Messrs. Willans & Robinson, Ltd., for a 5,500-kw. turbo-alternator at 1,000 r.p.m. (Dick-Kerr alternator) has been accepted. The tender of the Stirling Boiler Co. for three water-tube boilers has also been accepted.

APPOINTMENTS AND PERSONAL NOTES

Mr. E. J. Fox is resigning his position with Messrs. Willans & Robinson, Ltd., of Rugby, to take up an appointment in London with Messrs. Stewarts & Lloyds, Ltd. Mr. Fox has been some nine years with Messrs. Willans & Robinson, Ltd., and must be very reluctant to leave the firm with which he has been so long connected. We have reason to believe, however, that the inducements offered him were such that he could not, in justice to himself, have refused them.

On Friday last, Mr. A. G. Seton-Chisholm, of Messrs. Siemens Bros. & Company, Limited, was married to Mrs. Ella Smith at St. Margaret's, Whalley Range, Manchester. Mr. Chisholm has many friends in the electrical industry, who will wish him every happiness.

Mr. D. Neill Keith, Assistant Electrical Engineer in the Southern Nigeria Public Works Department, has left that colony for similar work in Ceylon.

An engineer canvasser with commercial experience is wanted at Barrow-in-Furness. (See an advertisement on another page.)

We are informed that Mr. P. J. Pringle, Borough Electrical Engineer and Tramways Manager at Burton-on-Trent, has accepted an important appointment in Australia, and is leaving in the course of a few weeks.

Mr. A. Barbour has been appointed Mechanical Engineer-in-Charge at the Whiston Street power-house of the Shoreditch Borough Council. There were 170 applicants for the post.

A repairs engineer is required in a three phase H.T. generating station in N.W. London. (See an advertisement on another page.)

South London Single-Phase Railway.—Owing to the increasing patronage of the single-phase line between London Bridge and Victoria, it has been decided to increase the number of trains during the morning and evening.

Warwickshire and South Stafford Branch of the Institution of Mining Electrical Engineers.—A meeting of this branch, at which seven members were present, was held on Saturday last at Birmingham. The discussion on a paper by Mr. Wm. Foster was continued, and afterwards Mr. Foster replied to the various questions raised. A curve was also shown by Mr. J. R. English on the resistance of the human body to electrical currents, based on Mr. Foster's tests. The discussion on Mr. Maurice's Presidential address at the annual general meeting was then taken up.

The Batti-Wallahs' Society.—A smoking concert, which proved highly successful, was held by the Batti-Wallahs' Society on Monday last at the Holborn Restaurant. Arrangements have been made for fortnightly meetings to be held at the Bedford Head Hotel, Tottenham Court Road, W.C., throughout the winter. A private billiard room has been reserved for members with the free use of the table from 7.30 p.m. until 12 o'clock. The dates of forthcoming concerts are December 9th, February 24th, and April 21st, and the annual dinner takes place on March 17th next.

OSRAM·LAMPS

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 10s. per ton (last week, £59 to £59 5s.).

Agency.—The Rugby Lamp Co., Ltd., Rugby, have appointed Messrs. J. A. Rudd & Co., 68 Gordon Street, Glasgow, as their agents in Scotland for the sale of "The Rugby" metal filament and carbon filament lamps.

Siemens' Lamp Works.—Messrs. Siemens Bros. Dynamo Works, Ltd., of Tyssen Street, Dalston, London, N.E., ask us to announce that they have made arrangements for additional telephone lines, which will shortly be in operation, and for the time being tender their apologies to those customers whose calls have been delayed owing to the excessive rush on their present lines.

Canadian Agencies Wanted.—A Midlands firm, manufacturing electrical storage plant, generators, and electric specialities, desire to appoint Canadian resident agents for the sale of their goods. Particulars from the Board of Trade, 73 Basinghall Street, London.

Branch Office.—The A.E.G. Electrical Co., Ltd., of Pembroke House, Oxford Street, London, have opened an office in Birmingham at Winchester House, Victoria Square. Telephone 7564 Central; telegraph, Circuit, Birmingham.

New London Office.—Messrs. Hans Renold, Ltd., have opened an office in Kingsway House, Kingsway, London, W.C., which will be managed by Mr. Charles E. Holliday, who has held a leading position with the firm in Manchester for many years. The London office will deal particularly with matters requiring personal attention, but ordinary enquiries and correspondence should be addressed to Manchester as hitherto.

Liquidations.—The Synchronised Clock Co., Ltd., is to be wound up voluntarily. A meeting of creditors will be held to-morrow at 11 Waterloo Place, Leamington Spa. Mr. C. H. Waterman is liquidator.

A meeting of creditors of Telegraph & Telephone Instruments, Ltd., will be held on Monday at Lennox House, Norfolk Street, Strand, London.

Bankruptcies.—The last day for receiving proofs in the bankruptcy of A. E. Felgate and W. Storey, electrical engineers, 10 Queen Victoria Street, Reading, is Monday. Mr. B. P. Allnatt, 2 Forbury, Reading, is liquidator.

Anchor Cable Athletic Club.—A very successful dance was held by this club on Saturday last at the Leigh Church Institute, when silver cups and medals were presented to the cricket section of the club. Mr. J. Bowyer, Works Manager, presided.

Railway Electrification.—It is stated that the Great Eastern Railway Co. have secured a site at Enfield for the purpose of erecting a power-house in connection with the contemplated conversion of some of their suburban lines to electric traction.

Telegraph Traffic.—By order of the Uruguayan Government, censorship has been established on telegrams to that country. Similar restrictions have been revoked by the Nicaraguan and Costa Rican Governments.—The cable between St. Louis and Teneriffe was out of action on 27th ult., and during this interruption telegrams are being sent via Brest-Dakar.—The El Arich route was down on the 28th ult. beyond Beyreuth, but was restored on the following day.—It is rumoured that the Western Union Telegraph Co. has had some ill-luck during the laying of the new cable across the Atlantic to Newfoundland. It is reported to have broken a few days after laying a considerable distance from the coast.

A Workmen's Compensation Case.—A further application was made last Wednesday in the Shoreditch County Court in the case in which an electrician named W. F. Sharpe sued the Mayor, Aldermen, and Councillors of Shoreditch under the Workmen's Compensation Act. The plaintiff appears to have received injury from a shock at the Shoreditch generating station in December, 1908. Until April 19th, 1910, half wages had been paid to him, but it was then suggested that he could return to work. This he tried to do, but, owing to the state of his nerves, ceased working. The matter then came before the Court, and eventually the man, who was stated to be suffering from traumatic neurasthenia, was sent to a convalescent home for a month. At the expiry of this period the Council again found work for him in connection with the substitution of electric light for gas for street lighting. This he again claimed to be unable to do, and the present case was brought. The defence submitted that the man could do the work, and the medical referee, Dr. Bate, concurred with this view. Finally, the judge said that he would not make any award which might retard an amicable settlement, but would adjourn this case, ordering the man to do whatever work he was offered consistent with reason.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Metalite.—The statutory meeting of this Company, which has been formed to acquire the business of the Bryant Trading Syndicate, was held on Friday. It was said that a site had been acquired at Derby for the erection of new works to cope with the Company's increasing business. The Chairman said that since August the new Company has been compelled to refuse orders for delivery during the present season for no less than 980,000 lamps. The new site at Derby already contains factory buildings, which cost approximately £14,000, but which have been acquired for £7,000. The factory will ultimately have a floor space of 200,000 square feet. Mr. J. Metcalfe, Managing Director, said that when the orders now in hand were completed there would be a net profit exceeding £160,000. He also said that a number of firms have indicated their intention of dealing only in Metalite lamps when the Company is in a position to supply them with their requirements. Many complaints have been received of the inability to obtain the Company's lamps, but he had no doubt whatever that in the early part of next year they would be able to multiply their output by five or six. He had no doubt that the shareholders would be more than delighted at the end of the coming year with the dividends they would receive.

Edison & Swan United Electric Light Co.—The result of the year's trading to June 30th is a loss of £3,184, which is deducted from the £10,027 brought forward. This result is attributed mainly to the high cost of production of metal filament lamps during the earlier part of the year. These costs, however, have been largely reduced, and a marked improvement is looked for during the current year. The report regrets the resignation of Sir Joseph Swan from the board in consequence of ill-health.

Wireless Telegraph Notes.—It is stated that while experiments were being made with the wireless telegraph apparatus on the new steamer *Drumcraig*, in Glasgow harbour last week, a message was picked up from the homeward bound Anchor liner *Caledonia*, whilst 850 miles at sea.

An interesting feature of the new Whiteley building in London, the foundation stone of which was laid last week, will be a wireless telegraph equipment.

Electrical Press v. Mountain.—This action, which is one by the proprietors of *Electrical Industries* against Mr. M. B. Mountain for alleged fraudulent misrepresentation, was to have been dealt with in the King's Bench Division on Friday. After a consultation in Court, however, the Judge allowed it to stand over for a fortnight, upon an intimation that he might not then be troubled with the case at all.

Steam Valve Explosion.—On Monday afternoon an explosion occurred at the Bow generating station of the Charing Cross, West End & City Electricity Supply Co., resulting in the deaths of two men and injury to two others. It appears that the men were working on a steam valve in a main steam pipe when the valve burst. On inquiry at the Company's offices, we understand that the supply was not interrupted on any part of the Company's system.

Defective Tramlines.—At the Clerkenwell County Court last week a jobmaster sued the London County Council for £4 2s. 6d., damage to his van through the wheel coming into contact with one of the rails of the electric tramways which projected some distance above the level of the ordinary roadway. The County Court judge decided that the rail constituted a danger to the ordinary road traffic, and gave judgment against the London County Council.

Students' Section of the Institution of Electrical Engineers.—The opening meeting of the session will be held at the Institution, Victoria Embankment, on Wednesday, November 16th, at 7.45 p.m., when Mr. C. H. Wordingham will deliver an address. At further meetings at the same place and hour, Papers will be read as follows:—Nov. 30th: J. C. Rennie, "Tramway Brakes and Brake-gear"; Dec. 14th: J. F. Shipley, "Progress in Arc-Lamps"; Jan. 19th: P. R. Coursey, "Wireless Telegraphy, with special reference to 'Short-spark' methods"; Feb. 1st: H. Clark, "Telephony"; Feb. 13th: H. C. Mary, "Dry-core Lead-covered Telephone Cables"; March 15th: R. C. Plowman, "Exhaust Steam Turbines"; April 12th: J. M. Bloomfield, "Overhead Lines for Transmission of High-tension Electrical Energy"; April 26th: J. B. Sparks, "Electric Traction on Main Line Railways"; May 3rd (annual general meeting): A. E. E. Cheal, "Some New Zealand Electric Plants."

SUMMARY

ALTHOUGH electric cars are almost unrepresented at the Olympia Exhibition, electricity is well to the fore in the accessory section, both in lighting apparatus and ignition appliances. Special lighting systems involving constant-voltage variable-speed dynamos are shown, and some improved designs of magnetos and dual ignition systems. (Page 707.)

SIR J. CLIFTON ROBINSON died suddenly last Sunday from heart disease in New York. (Page 708.)

THE re-trial of the action by Mr. C. A. Gould, of the American Gould Storage Co., against Mr. Lehwess, the promoter of the London Electrobus Co., for payment for batteries supplied in connection with that undertaking, is now proceeding before Mr. Justice Ridley and a special jury in the King's Bench Division. The batteries were supplied subject to certain tests being passed, and it is alleged that Dr. Lehwess intentionally prevented the tests being carried out. (Page 708.)

IN our monthly illustrated article on new supplies and accessories, a new pendant designed to withstand rough usage is described, and details are given of two new patterns of arc lamp. A design of convection heater in cast iron case is also illustrated. (Page 709.)

SOME figures of the actual cost of electric cooking are given. (Page 711.)

A DISCUSSION took place at a meeting of the Electrical Contractors' Association last week with regard to imposing a standard of work upon all members of the Association in an endeavour to improve the quality of wiring work generally. Complaints are being made at the action of certain electric supply companies undertaking wiring work. There is also a feeling among the members of the Association that the agreement with the Cable Makers' Association is not altogether in their best interests. (Page 711.)

MR. H. M. HOBART read a long Paper recently before the Arc Works Engineering Society, in which he dealt with the economic aspects of the electrical working of railways, and worked out estimated figures for a hypothetical case in some detail for both the continuous-current and single-phase systems to the disadvantage of the latter. Finally, he expressed the extreme view that in those cases where circumstances are such that, according to his basis of comparison, the single-phase system would show more economy than the continuous-current system, the retention of steam working would be more economical than either. (Page 713.)

THE annual report of the Postmaster-General records progress in the construction of the underground telegraph lines and other advances in the telegraph and telephone departments. Some criticisms of the telephone finance are answered. (Page 715.)

A LETTER from H. L. Webb criticises the finances of the Post Office telephone system. (Page 716.)

MR. C. FARADAY PROCTOR, in his inaugural address as Chairman of the Newcastle Section of the Institution of Electrical Engineers, attributed much of the success of foreign industrial competition to the unsuitability of our educational system. (Page 716.)

A WATER-POWER scheme of considerable size is under consideration in Tasmania. (Page 716.)

AMONG the specifications published by the Patent Office on Thursday was one by the Gesellschaft für Drahtlose Telegraphie for a relay for wireless telegraphy consisting of a light suspended armature attached to one electrode of a carbon microphone contact. The use of several such relays in series in combination with recording apparatus is described.—Mavor & Coulson, Ltd., patent an alternator for generating current at two different frequencies without alteration of the speed or of the rotor winding.—An automatic sign switch is described by the Reason Manufacturing Co.—Two patents by G. Bell and J. V. Pletts cover heating and cooking apparatus, in which the heat is stored up in an isolated body and conducted to the

Digitized by Google

cooking utensils or to an oven by means of water circulating pipes.—A patent by J. H. Rosenthal for the combination of a superheater and a water-tube boiler with connecting pipes to both steam and water spaces of the drum, expires on Saturday after the full life of fourteen years. (Page 718.)

THE local gas company have objected to the Bray Council undertaking wiring, but the Council have replied that they do not wire premises.—It is stated that Edison storage-battery tramcars are to be run in Krugersdorp (S.A.).—The accounts of the West Ham Electricity Department show a loss of £93, but the rating of the undertaking has been increased to no less than £5,207.—In spite of the opposition of the local authorities, the tramway scheme between Brighton and Worthing is to be placed before Parliament.—A deputation from the Paris Municipal Council is at present in London inspecting the tramways. (Page 717.)

GENERATING machinery is required at Gloucester and Bispham. Extensions are contemplated at Barking, Beckenham, Queenstown (S.A.), Luton, and Wolverhampton. The Southampton Corporation require 2,000 radiator lamps; a 1,000-kw. mixed-pressure turbine is required at Walthamstow; and electric lighting plant by the Radford County Council. Electrical stores are required by the North Eastern Railway Co. and the Great North of Scotland Railway Co. (Page 717.)

THE capital of Robertson Electric Lamps, Ltd., is to be reduced from £100,000 to £35,000. The Cape Electric Tramways Co. show a profit of £9,047 for the year to June 30th. (Page 720.)

A 1½ KW. Balsillie wireless equipment, with a normal working radius of 400 miles, has been fitted on the Liverpool cargo boat *Drumcraig*. Time signals for ships are being sent out twice daily from Nordeich, in Germany, as well as from the Eiffel Tower. (Page 720.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 10TH.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. Presentation of scholarships and premiums, and inaugural address of the President, Mr. S. Z. de Ferranti.

Institution of Electrical Engineers: Dublin Section.

8 p.m. At Royal College of Science. Address on "Practical Electrical Measurements," by Mr. W. Tatlow.

TUESDAY, NOVEMBER 15TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At School of Technology. "Recent Electric Locomotive Practice and the H.T. D.C. Railway System," by A. Monkhouse.

WEDNESDAY, NOVEMBER 16TH.

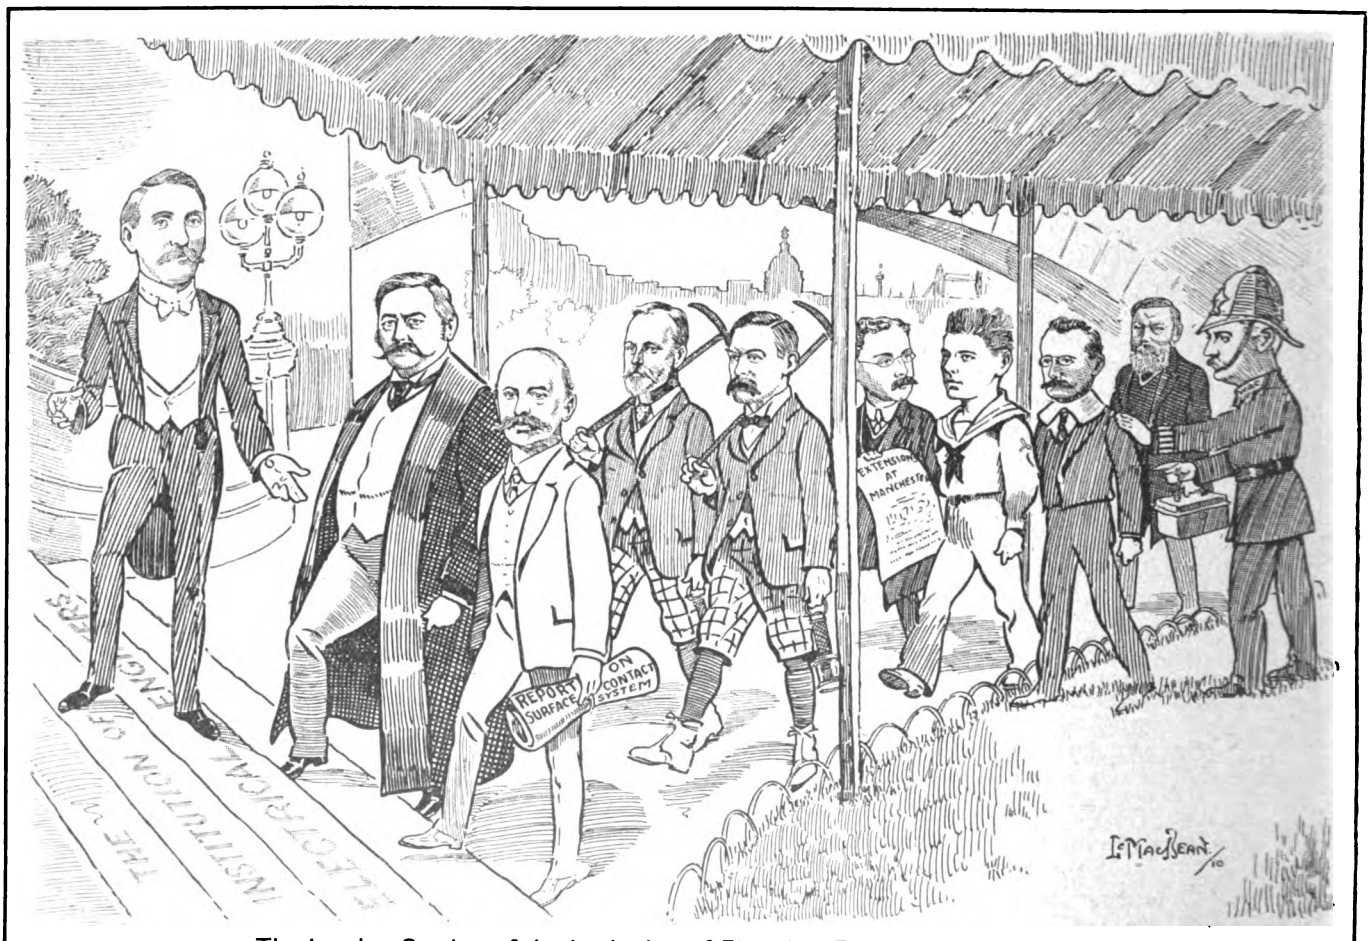
Institution of Electrical Engineers: Yorkshire Section.

7.15 p.m. At Leeds University. Address by Chairman, Mr. T. Harding Churton.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At Victoria Embankment. Address by Mr. C. H. Wordingham.

SATURDAY, NOVEMBER 12TH.



Birmingham and District Electric Club.

7 p.m. At Colonnade Hotel, New Street.

Institution of Junior Engineers.

7.30 p.m. At Royal United Service Institution. Presidential Address by Sir J. J. Thomson, F.R.S., on "The Influence of Pure Science on Engineering."

Telegraph Traffic.—The Direct Spanish Telegraph Co. has again suffered a reverse, the Marseilles-Barcelona section of cable having ceased working on 2nd inst., but a repair was effected on the 4th inst. Communication between Rome and Constantinople was down on 3rd inst., but was restored to working order on the 5th inst. The land lines between Saigon and Annam and Tonkin were interrupted on 4th inst. north of Khatrang Annam. The Indo-European Telegraph Co.'s land lines were down between Kertsch and Sonkhoum on the 4th, but were restored on the succeeding day. The C.S. *Faraday*, which began to lay down the new cable between England and Norway on October 22nd, at Newcastle, arrived on November 5th at Arendal, thus completing its work. The new cable has been tested, and proved very satisfactory.

The London Session of the Institution of Electrical Engineers opens to-day.

Digitized by Google

ELECTRICITY AT THE OLYMPIA MOTOR CAR EXHIBITION

NOW that the pioneering days of the motor car are over, each of the annual exhibitions organised by the Society of Motor Manufacturers and Traders seems to contain less that may be described as novelty, for the principal changes are rather in the direction of increased perfection. This may be said to apply quite as much to electrical accessories, to which we wish to direct attention here, as to the magnificent collection of complete vehicles and chassis which are the products of modern automobile engineering.

It appears that in this country, at least, the electric private passenger car has not increased in popularity, for only one firm (The Electric Vehicle Co.) has shown anything of this nature. Two cars are on view on their stand, both in external appearance resembling petrol cars. One is a phaeton with collapsible rear seat, provided with a 195 ampere-hour 40-cell battery, said to be capable of 100 miles on one charge and a maximum speed of 30 miles per hour. The other is a smaller car, of a type which figured in the Show last year.

In the gallery there is more of electrical interest; a good deal of attention appears to have been paid to the electric lighting of cars, and an increased number of firms show sets with special dynamos for running off the engines after the manner of train lighting sets. Improved electric lamps are shown on a great number of stands; and, while we do not find any startling new developments, there are evidences of steady advance in the design of magneto and other forms of ignition gear.

Taking the car-lighting apparatus in more detail, we find a number of systems worked out in great completeness, and evidently well beyond the experimental stage. The latest form of the "C.A.V." system, of Messrs. C. A. Vandervell & Co. (Warple Way, Acton), employs a special dynamo giving a practically constant voltage over a considerable range of speed. The regulation is effected by the cross magnetising flux due to the current in the armature coils short-circuited by the brushes upon a pair of unwound auxiliary poles provided for the purpose. An important feature of the system is that no automatic switches are used, as the dynamo is not cut out when the engine speed drops too low, but is simply allowed to run at its own speed as a motor by a free-wheel arrangement. The details of the equipment are well worked out, and a special armoured cable is used for the wiring. The Blériot lighting outfit (Blériot, Ltd., 53-54 Long Acre) embodies a constant-voltage dynamo on a slightly different principle, with a centrifugal arrangement mounted on the end of the shaft working a cut-out switch when the speed falls. Needless to say, the firm show a large variety of the lamps, for which they are as famous as for the manufacture of aeroplanes. The well-known Leitner system of train lighting as applied to motor-cars, embodies another variety of constant-voltage variable-speed generator, in which the cut-out switch is electrically controlled, and is demonstrated by the Rotax Motor Accessories Co. (43 and 45 Great Eastern Street, E.C.). The Ducellier system, shown in action by A. A. Godin (1 Red Lion Square) is different in that the main field of the generator is provided by permanent magnets in conjunction with field coils for producing the adjustment according to the speed. The automatic cut-out switch in this system also is electrically controlled. Permanent field magnets are also used in the Mira "C.J.L. Magnetolite" system, shown on the stand of the High Tension Co., 1A Guildford Street, W.C., but the regulation is entirely due to armature reaction, and no auxiliary field coils or extra brushes are used.

The system exhibited by Messrs. Peto & Radford is somewhat different in principle, and employs a centrifugally-controlled slipping clutch to control the speed of the dynamo. The lighting dynamo shown by Longstreth's, Ltd. (190 Queen's Road, Battersea), is also provided with a centrifugal slipping clutch to limit its speed, but carries also on the other end of the shaft a centrifugal contact arrangement which only keeps the machine in circuit when the speed is above a certain value. These examples embody most of the main features of the leading systems, but several other exhibitors, including Messrs. Joseph Lucas, Ltd. (Birmingham), and Messrs. J. C. Fuller & Co. (Wick Lane, Bow), have also taken up the matter, and show variable-speed dynamos and complete lighting outfits, with the necessary cut-out switches. Nearly every accessory firm shows electric motor-car lamps of one sort or another, and among these attention may be drawn to the "R.V." lamp, shown by W. J. Harvey, Ltd. (415 Oxford Street), in which the parabolic reflecting surface is hermetically sealed, so that no cleaning is required, and the position of the lamp is adjustable to obtain either a concentrated or divergent beam as desired. The now well-known "Silverlyte" lamps, in which the reflector and lens simply consists of a solid conical block of Jena glass, with a convex front and without any silvering, and with the lamp inserted in a recess at the back, are shown on the stand of Hedley S. Hunt & Co. (9 Farringdon Road, E.C.).

There are a great number of exhibitors of ignition apparatus, and, with one very notable exception, practically all show high-tension magneto systems, combined usually with some form of battery and coil for starting and as a stand-by. Indeed, it may almost be said that the so-called dual ignition is now the standard in all up-to-date cars. The retention of the battery and coil is not due to any unreliability on the part of the magneto, but is provided more as a matter of convenience in starting, especially for being able to start "on the switch."

The one coil system that competes with success against the magneto is that originated by Sir Oliver Lodge, and shown in its latest form by Lodge Brothers & Co. (14 New Street, Birmingham). Various patterns of coil are shown, in which the working spark is really a secondary spark caused by the sudden overflow of a pair of condensers, and a novelty is exhibited in the Lodge "spark lamp," a spark-gap in a little partly exhausted bulb, which is fixed to the head of the plug, and can be put in series with it when required to act as a signal that the plug is working by showing a very visible glow.

The magnetos shown do not differ very widely from those we gave notes on last year (ELECTRICAL ENGINEERING, Vol. V., November 18th, 1909, page 983). Dual systems are now the rule, using the same high-tension distributor and plugs for the magneto and coil, with convenient change-over switching arrangements and push-buttons for obtaining a spark at starting. A typical and widely-used system on these lines is that of the Bosch Magneto Co. (40-42 Newman Street, W.). This firm have also a system for obtaining increased power at very high engine speeds, involving the use of two plugs in series in each cylinder. There is an imposing display of the Simms Magneto Co., Ltd. (Kimberley Road, Kilburn), who also show British-made high-tension magnetos of all sizes, self-starters, and a full dual system. The Hall magneto, formerly known as the E.I.C. Hall, but now known as the Hall E.O.A. dual system, is shown by the Electric and Ordnance Accessories Co., Ltd. (Cheston Road, Aston, Birmingham). It will be remembered that the distributor in this system is mounted horizontally, clear of the field magnets, and driven by a worm gear arranged to vary the timing by rocking its axis. It has several other constructional features of interest. Another magneto system well worthy of examination is that of Nilmelior, Ltd. (36 and 37 Alfred Place, Tottenham Court Road). A magneto somewhat different in construction from many is the "Mea" magneto, shown by United Motor Industries, 45-46 Poland Street, W. This is very small in size, and has the armature set lengthwise in the field of a bell-shaped magnet. The whole machine is arranged to turn to adjust the timing. It is, of course, impossible to mention all the numerous firms exhibiting ignition apparatus, but mention should not be omitted of the fine display of ignition and lighting accumulators made by Van Raden & Co. (Great Heath, Coventry).

Of more interest, perhaps, to engineers in general is the stand of Drummond Brothers (Churchill Works, near Guildford), who have a number of their well-known repairing lathes and drilling machines, and a special foot-driven universal grinding machine on view in the gallery. Attention should also be drawn to the exhibit of their special patterns of silent chains by Hans Renold, Ltd. (Progress Works, Brook Street, Manchester).

Advanced Lectures of Telegraphy and Telephony.—Professor J. A. Fleming,, F.R.S., will deliver a course of advanced lectures on "The Theory and Practice of Electrical Measurements, with Special Reference to Telegraphy and Telephony," at University College, on Wednesday afternoons at 5 p.m., beginning January 11th, 1911. The course is designed to meet the needs of post-graduate students, teachers, telegraph, telephone and electrical engineers generally possessing some knowledge of the subject of electrical measurement, but desiring to make a further study of the advanced theory and practice. As only a limited number of students can be admitted, early application should be made. Full particulars may be obtained from the Secretary of the College.

Accuracy in Fuel Calorimetry.—We have received a reprint of a paper by Mr. G. Nevill Huntly on the accuracy obtainable in fuel calorimetry, which was read recently before the Society of Chemical Industry. The subject is discussed in considerable detail, and the author finally arrives at conclusions which may be summarised as follows:—The limit of accuracy in the comparison of the heating values of fuels is from 0·1 per cent. to 0·3 per cent., and this can only be reached after a most careful study of the thermometer and calorimeter and the application of numerous corrections. If the small corrections are neglected the errors may amount to from 1 per cent. to 2 per cent. The heats of combustion of the standard substances used for the determination of the water equivalent are not certain within 0·5 per cent. The errors due to hand sampling cannot be reduced with certainty below 0·5 per cent., and may easily amount to 1·5 per cent. to 2·0 per cent. He points out that so far as coal is concerned, it is at present more important to devise means for reducing the errors of sampling than to increase the accuracy of the calorimetric determination.

OBITUARY

SIR J. CLIFTON ROBINSON.

THE news of the sudden death on Sunday night at New York from heart disease of Sir J. Clifton Robinson has come as a shock to many. By a strange coincidence, it was in a tramcar that the great pioneer of tramway enterprise was seized with the attack that proved fatal, and he succumbed shortly after in a New York chemist's shop to which he had been taken. His decease removes a prominent figure in the tramway world, a pioneer who battled against great difficulties, and a man who probably did more towards the introduction of electric tramways to this country than any of his contemporaries.

His connection with tramway enterprise began at the early age of twelve, at Birkenhead, his native town, in his association with Mr. G. F. Train in the construction of the first real tramway in this country, from Birkenhead to Woodside Ferry, in 1860. He worked under Mr. Train on tramway construction in Staffordshire and elsewhere, and accompanied him to America in 1866. For about three years he was thus employed on tramway work in New York, but in 1871 he entered the contracting firm of Fisher and Parrish, and assisted in tramway construction in Liverpool, London, and Dublin. His subsequent positions included management of the Cork tramways, and he was in charge of the Bristol system from 1875 to 1882. These were, of course, all horse tramway systems. In 1882, however, he assumed the management of the Edinburgh tramways, and then began his connection with the cable system, which was continued in his work on the Highgate Hill line, on behalf of the Cable Tramways Corporation. This line was opened in 1884. About three years later Mr. Robinson went to America, and while equipping cable lines at Los Angeles, first began to see the possibilities of electric traction, and after acquiring experience with the construction of some of the electric lines then so rapidly spreading in the United States, Mexico, and Canada, he returned to England, to become managing director, in 1891, of the Imperial Tramways Co.

The list of British lines upon which he reported, and the conversion of which to electric traction was accomplished under his supervision, is too long to give here; it includes Dublin, Reading, and Bristol, but his most notable achievement was in the consolidation and remodelling of the West Metropolitan tramways, culminating in the present gigantic system of the London United Electric Tramways. In this work he had great difficulties to contend with, and was continually meeting with opposition from local authorities, &c., who placed very heavy burdens in the way of the development and extension of the system. He remained at the helm of the London United Tramways for sixteen years, and it was only this year that he resigned his position as managing director and engineer. "There are," he then declared, "fresh fields where I can develop the system of electric traction. Municipal tramways have snuffed out private enterprise, and the ground is now well covered in London. Abroad it is different. Further afield there are still ample opportunities, and more encouragement than this country affords." It is sad to think that his hopes could not be realised.

Sir Clifton Robinson was knighted in 1905, and it should be mentioned that he contributed a number of Papers on tramway subjects to Societies on both sides of the Atlantic. One of them, entitled, "The World's Tramways," earned him the silver medal of the Society of Arts. In addition to his connection with the London United Tramways, he was on the board of the Bristol Electric Tramways, the Metropolitan District Railway, and Underground Electric Railways Co. of London.

ELECTROBUS COMPANY AND ITS BATTERIES

BEFORE Mr. Justice Ridley and a special jury in the King's Bench Division on Monday the re-trial of the action by Mr. C. A. Gould, of the Gould Storage Battery Co. of America, against Dr. E. H. Lehwess in respect of a contract for the supply of batteries for the London Electrobus Co. was commenced. The previous action was reported in ELECTRICAL ENGINEERING, Vol. V., 1909, pages 488 and 1064, the new trial being ordered by the Court of Appeal on the ground that the damages awarded to Mr. C. A. Gould, who won the first action, had been assessed upon insufficient evidence. Mr. Gould claims £2,600 for the purchase of 16 sets of batteries of 42 cells each, which were sent to England under an agreement with Dr. Lehwess, who undertook to form an English Gould Storage Battery Co., with a cash capital of £25,000. A company called the Gould Storage Battery Co., Ltd., was duly registered in this country with a nominal capital of £25,000, and according to Mr. Atkin, K.C., who appeared for Mr. Gould, 21,000 shares were allotted to a company called the Asiatic Banking & Trading Corporation as fully paid up, in return for which the latter company was to do all in its power to bring the Gould storage battery before its friends and associated companies, and also to advertise the Gould Co. at its place of business. It was said that the Asiatic Corporation was registered in Jersey, and had a paid-up capital of only seven shares; that it had no connection with Asia, with banking or trading. Counsel further stated that the company had never done any business, had no directors, and was absolutely void of content altogether. It was, he said, a mere device by which Dr. Lehwess allotted to himself the whole of the issued capital, namely, 21,000 shares, leaving 4,000 shares unissued. Before sending the 16 batteries to England, Mr. Gould had cabled from America asking Dr. Lehwess the position with regard to the English Gould Co., and received the following cable: "All shares issued cash about £4,000 reserved." Mr. Gould read this—and during the proceedings, Mr. Justice Ridley suggested that at the moment it was the only way in which he thought the cable could be read—to mean that all the shares had been issued, and that £4,000 had been reserved as cash to carry on the company, putting the remaining £21,000 to a separate account as unnecessary for the then purposes of the company, and which would accumulate interest. As a matter of fact, said Mr. Atkin, no money whatever had been subscribed, and at no time did the Gould Company have more than £107 to its credit. Reading the cable in this way, Mr. Gould sent the batteries to England under certain conditions as to complying with specified tests, when they would be paid for. A part of the case for Mr. Gould now is that Dr. Lehwess intentionally prevented the necessary tests being carried out, and that the batteries were put into use upon 'buses mechanically unsound in other respects, with the result that full justice was not done to them.

With regard to the tests, Mr. Atkin, K.C., and subsequently Mr. C. A. Gould himself, in the witness box, stated that after many attempts to get the tests carried out officially, Dr. Lehwess, when in New York, and whilst the 'buses were running in London, agreed to send a cable authorising the tests to be carried out. The tests were not carried out, and as an explanation Mr. Atkin suggested, on the sworn affidavit of an employee of the London Electrobus Co., that Dr. Lehwess had sent another cable on the same day telling his representative here to hold back the cable authorising the tests to be made, such a cable having been seen in the offices of the London Electrobus Co. It is claimed by Mr. Gould that unofficial tests of the batteries were made by his representatives over here which gave better results than those called for in the contract, one being that the battery lasted for four hours fifteen minutes at a discharge rate of 80 amperes. Another point in the case is that the tests agreed upon between Dr. Lehwess and Mr. Gould were not the same as those upon which the London Electrobus Co. agreed to take over the batteries, but that Mr. Gould had never had any dealings with the 'bus company. Nevertheless, Dr. Lehwess had refused to pay because the 'bus company would not take over the batteries. In cross-examination, Mr. Duke, K.C., for Dr. Lehwess, brought in the statement that the Tudor batteries gave better results, and that for extensions the London Electrobus Co. would have preferred them. The Judge, however, suggested that this had nothing to do with paying for the first batteries supplied by Mr. Gould.

The action was still proceeding when we went to press.

ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to The Editor, ELECTRICAL ENGINEERING, *203-6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.*

SINGLE-PHASE.—We can recommend you Punga's book on "Single-phase Motors" (post free 4s. 9d.) for the general theory of the different types; and drawings and particulars of the design of some actual single-phase motors will be found in "Electric Motors," by H. M. Hobart (post free, 18s. 6d.).

C. A. MCKAY.—We think that you will find the information you desire in Prof. J. A. Fleming's "Elementary Manual of Radiotelegraphy and Radiotelephony for Students and Operators" (post free, 7s. 11d.), and "Radiotelegraphy," by C. C. F. Monkton (post free, 6s. 5d.). There is no journal devoted exclusively to wireless telegraphy, but as you are doubtless aware, we publish news and articles on this subject in our own columns from time to time.

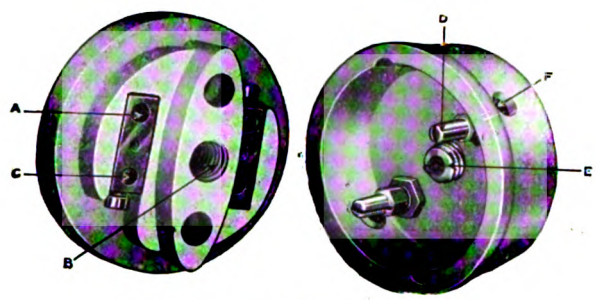
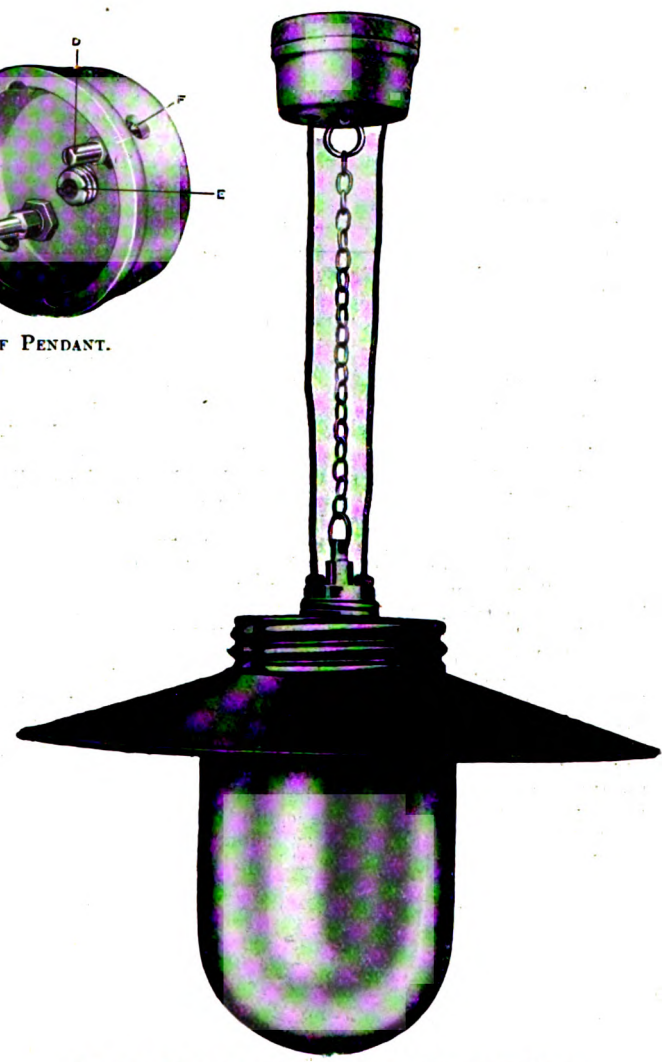
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Pendant Fittings.



Simplex Conduits, Ltd. (Garrison Lane, Birmingham) have just put on the market, at a very moderate price, a novel form of pendant for office, shop, and factory installations, with a view to reducing the risk of fire due to flexible pendants. As is well known, pendants in shop windows and factories are subject to a deal of rough handling, and the two conductors being twisted together, there is a risk of short circuit should the insulation be damaged. The object of this new pendant is not only to keep the two poles apart, but to relieve at the same time all strain upon the flexible and the terminals of the holder and ceiling-rose. The wiring can be done wholly at the bench, the pendant simply being plugged into position when the base has been wired to the main circuit in the ordinary way.

In the accompanying illustration of the ceiling-rose portion of the pendant, *A* is one of the two sockets in the main circuit terminals into which are plugged the split pins *D* on the cover connected to the flexible leads. The weight of the pendant is carried by the screwed metal plug *E*, which holds the cover on to the base by being screwed into the hole *B*. *C* is the loop-in terminal for the circuit wires. If, when the ceiling rose and pendant is in position, it is necessary to make any adjustment to the length of the drop, this can easily be done without disconnecting the rose as the split pins to which the flexible is connected can be got at through holes provided in the cover of the rose marked *F*.



Two forms of pendants are put on the market, one for offices and shops, in which cord suspension is used, and another for factory work, where iron mill fittings are generally installed. In this case coppered steel chain is used to take the weight. A neat form of anti-vibrator is incorporated to complete the pendant, but the latter may be obtained without this device if necessary. This anti-vibrator is supplied with springs of three different tensions to suit varying weights of the fittings which may be used, the method of construction constituting by far the most efficient anti-vibrator yet introduced. Adjustment to the tension can easily be made by means of adjusting the small nuts on the spindle which carries the spring. This adjustment, combined with the range of springs, has been found necessary to meet the varying requirements of a 10 in. opal shade or a 9 in. iron shade, a three-light ball fitting, and a cast-iron mill fitting.

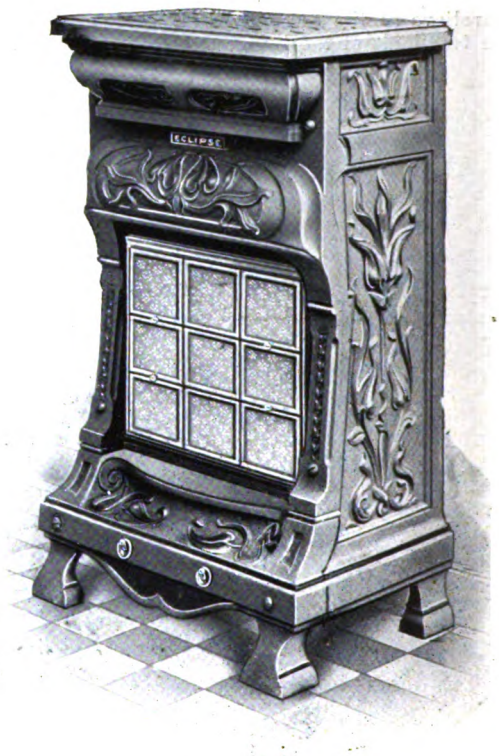
Ceiling-rose Portion of Pendant.

Simplex Factory Pendant with Separate Leads.

Arc Lamps.

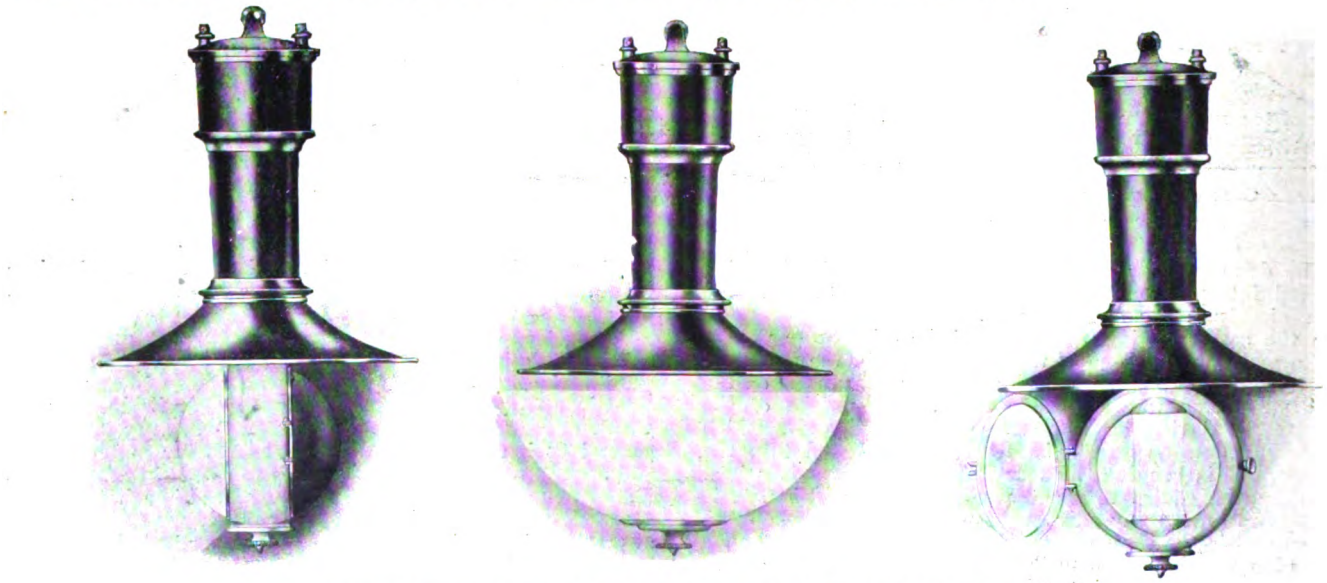
A new design of flame arc lamp for street lighting and the illumination of large open spaces has been introduced by the Globe Electric Co., Ltd. (11 Farringdon Avenue, London, E.C.), under the name of the "Multax" Century lamp. In general design this lamp follows the 36-hour pattern Globe "Multax" lamp, described and illustrated in Electrical Engineering, March 10th, 1910, p. 163, although it is constructed on somewhat different principles, which cannot be at present disclosed. The lamp has been particularly designed for the illumination of streets, railway stations, dockyards, harbour works, &c., and for this reason has been fitted with a projecting reflector consisting of an inverted truncated cone

C



Digitized by Google

in the lower portion of the globe. This reflector considerably increases the distribution of light in a horizontal direction, and is claimed to be an important improvement for lamps intended for street lighting. The lamp has a purely gravity feed, all clockwork being entirely dispensed with. A burning period of 100 hours on one trim is said to be obtained, and although two pairs of carbons are used, the lamp is entirely non-magazine, as the arc burns alternately from each pair in a similar way to which it travels from core to core in the case of the patent bridge core carbons of the ordinary "Multax" lamp.



The Jandus Arc Lamp & Electric Co., Ltd. (Hartham Road, Holloway, London, N.), have introduced a small pattern of their well-known regenerative flame arc lamp, which is still the only truly enclosed flame arc lamp on the market. A description of the original pattern appeared in ELECTRICAL ENGINEERING, February 27th, 1908, Vol. III., p. 299. It will be remembered that the arc is enclosed in a narrow glass cylinder, which communicates at top and bottom with two metal tubes arranged one on either side of the outer globe. A circulation of the hot gases and chemical particles is thus produced down the metal tubes and up through the arc. By this means the chemical products giving the arc its light-producing and colour properties are used over and over again. This is an important feature of the lamp, as the slow-burning carbons would not liberate enough chemicals to keep the arc in proper condition if the gases and particles were carried away immediately, as in the case of the ordinary flame arc. The chemicals are made up in the form of a paste, which is pressed into the grooves of the lower carbon, which has a star-shaped section. A clutch-feeding mechanism with differential series and shunt-coil control, similar to that employed in the ordinary "Jandus" enclosed lamp is employed. The present small-pattern lamp takes only from 200 to 300 watts on direct-current circuits, and from 250 to 350 watts on alternate-current circuits. It is considerably shorter than the original pattern, being only 30 in. long, and is provided with a new design of outer globe as illustrated. In this design, the metal tubes are of oval section, and are made to form the frame for two translucent hemispherical globes. One is attached direct and the other is fitted like a hinged cover, so that the interior can be easily cleaned. This outer globe need not be opened or removed for trimming, however, which is done by removing the lower screw. The lamp takes 5 amperes at 50 to 55 volts, and has an average candle-power of 1,100. Using the standard "Jandus" regenerative carbons, it burns from 70 to 90 hours on one trim. It is claimed to be especially suitable for shop lighting and side-street lighting, and more economical than clusters of metal filament lamps for this purpose. For shop-front lighting one of the glass segments is replaced by an aluminium segment enamelled in the interior to act as a reflector, as illustrated. For interior illumination, a translucent bowl is fixed under the outer globe. This softens and diffuses the light, and the shadow thrown by the outer tubes is said to be hardly noticeable. If the lamp is not hung close to the ceiling, a metal reflector is fixed just above the globe, as shown. Remarkably low running costs are claimed for this pattern of lamp. It is claimed that for equal lighting effects, the total costs are only one-third those for ordinary enclosed arc lamps, and one-fifth those for metal filament lamps. A recent improvement to the "Jandus" lamps is the addition of an anti-vibration spring suspension device to the supporting pulley, which tends to steady the arc and produce more even feeding.

Heating and Cooking Apparatus.

A new list of "Eclipse" heaters has just been issued by the Electric and Ordnance Accessories Co., Ltd. (Aston, Birmingham). These are on the convection system, in which a current of air passes through the heater and flows out to mix with the air of the room at a temperature of about 300° F. The most usual size consumes 1½ kw., but smaller and larger heaters are also made. In addition to the great variety of designs in artistic sheet metal cases, the company have brought out some new patterns, of which one is illustrated here of enamelled cast-iron, with ruby glass panels, giving a cheerful glow.

CAST IRON E. & O. A. "ECLIPSE" HEATER.

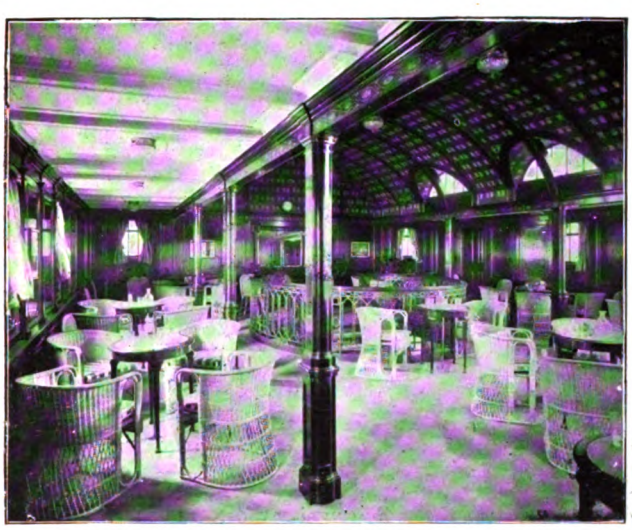
AN ELECTRIC KITCHEN

THE British Prometheus Co. (Salop Street Works, Highgate, Birmingham), have a complete installation of their well known electric cooking apparatus in the kitchen of the staff dining club at their own works. The equipment is represented in the accompanying illustration, and the following particulars of the cost, both of the apparatus and of its working, will be of interest. The principal items of the



ELECTRIC KITCHEN AT PROMETHEUS STAFF DINING CLUB.

equipment are: one oven, two vegetable cookers, one plate warmer, and one kettle, the total catalogue price of which is £44. During the week ending October 29th, the aggregate number of dinners cooked was 54, and the total number of courses 162. For this the energy consumption was 44·6 units, costing, at 1d. per unit, 3s. 8½d., or about four-fifths per person per meal.

ELECTRIC LIGHTING ON BOARD THE "BALMORAL CASTLE"

THE accompanying illustration, which we have received from Siemens Brothers Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston), represents a portion of the smoking lounge of the s.s. *Balmoral Castle*, on

SMOKING LOUNGE ON S.S. "BALMORAL CASTLE."

which the Duke of Connaught made his journey to South Africa. This is a fine example of steamship lighting, and it is of interest to note that Tantalum lamps have been adopted throughout. Experience on the many ships that have now been equipped with them shows that the Tantalum lamp is specially suitable to ship-lighting conditions, owing to the ease with which it withstands the vibration and severe treatment to which lamps on board ship must always be subjected.

THE WIRING CONTRACTORS' POINT OF VIEW

THE Paper by Mr. G. F. Ratcliff, Chairman of the London Section of the Electrical Contractors' Association, containing suggestions for raising the status and efficiency of that body, was summarised and criticised in our issue for October 13th, and was further discussed at the November meeting of the Association held last week. From the discussion, or rather informal conversation—for there were only fifteen members and three pressmen present at the meeting—it seems that the real complaint is not that members of the Association are carrying out inferior work at cheap prices, but that foremen and workmen, at one time in the employ of members, are now working on their own account, or in conjunction with builders. They can do the work cheaply, as they have practically no establishment charges, and members of the Association consider their competition as serious.

On the question of standard of work, the discussion resolved itself into an endeavour to discover a means of "hall-marking" the work of members of the Association. Advertisements in non-technical papers and in builders' and architects' journals were favoured, urging the employment only of members of the Electrical Contractors' Association. That the Association should guarantee the work of its members was considered to be too ambitious a proposition, at any rate by the members of the Council, whilst the application of a monetary limit to any such guarantee would naturally suggest a half-hearted way of going to work. A statement put at the foot of the contractor's specification and tender to the effect that the tenderer is a member of the Association and that the work would be carried out in accordance with the rules of the Institution of Electrical Engineers will certainly carry some weight, and it is a question whether members can do more at present. Inspection of all work carried out by members was put on one side as impracticable, whilst another suggestion that cases of complaint only should be inspected did not meet with general approval, it being submitted that the Association would then be open to the charge of acting as a consulting engineer. In some preliminary remarks made by Mr. Ratcliff, he made an insinuation which central station engineers will rightly resent. He said:—"The central station engineer is at his wits' end to keep his load line as high as previously. . . . In Greater London there are thousands and thousands of lights added every year in the outlying districts. I venture to say that at least 50 per cent.—possibly 75 per cent.—of that work would not pass the rules of the fire insurance companies if they were applied, and certainly they would not pass the Institution of Electrical Engineers, and yet they are connected to the mains!"

Assuming that a standard of work is imposed, is it beyond doubt that it will be adhered to in every case by all members of the Association? The Central Board has no power to pledge its members to work to any definite standard. The Electrical Contractors' Association has some experience of the impossibility of forcing its members to a particular course of action when their own business is concerned in the case of the agreement with the Cable Makers' Association. It is notorious that many members of the Contractors' Association do not follow the injunction to buy only C.M.A. cable, because they can get cable which they consider sufficiently good for their purpose more cheaply. One member inadvertently let this out at the November meeting, and was firmly, but genially, castigated by Mr. W. R. Rawlings for his want of loyalty. Nevertheless, Mr. Ratcliff, who is Chairman of the London Section, admitted that there was a great difference of opinion upon this point.

Finally, a formal resolution was passed referring to the General Board the question of imposing a standard of work upon all members. Care must be taken that in endeavouring to arrive at a higher standard, the impression is not given to consulting engineers and architects that the effects of a "ring" will be the result. As a basis to work upon, Mr. W. R. Rawlings made a few suggestions, the most important of which were as follows:—

"The technical details of all specifications to be carried out in their entirety unless mutually agreed to be modified by all parties. All wires and cables to be supplied by a member of the C.M.A., whether specified or not, and in all cases the grade of wire specified will be supplied. In the absence of a specification the size of wire is to comply with the rules

Digitized by Google

last published of the Institution of Electrical Engineers. The members of the Association will, as far as possible, confine themselves to the use of British-made goods. The Association will, at its own expense, examine into any complaints, and, if it is shown that the rules are not carried out, the Association will indemnify the consulting engineer, architect, or client against any expense they may incur in correcting such abuse."

Mr. Rawlings was, however, in doubt as to whether the time was ripe for the last of these rules.

The education of the consumers to a better standard of work would be an invaluable achievement, and some proposals were made with the view of attaining this. For instance, any case of a fire insurance company passing bad work is to be publicly exposed—presumably in the Association's journal. A similar fate is to befall any contractor or municipality putting in inferior installations—but these latter can only be judged in relation to the Association's own standard, which must necessarily be fixed first.

It was hinted that the Institution of Electrical Engineers' rules were too vague to adopt as a standard, but Mr. Rawlings, who is the Association's representative on the Wiring Rules Committee, said that the new rules which will be issued shortly will be more definite and will remove certain doubts. The use of slip socket, which it was thought was prohibited under the old rules, will be absolutely barred unless the joint has the same conductivity as the tube itself. Lighting cables are to be calculated on the basis of a drop of 2 per cent. *plus* one volt. For heating and power purposes, it is laid down that the drop in volts shall not exceed 10 per cent., and that the size shall be determined by the heating effect, viz., a rise not exceeding 21° F. above the surrounding atmosphere. Any suggestions sent to Mr. Rawlings will be placed before the committee. The idea of having a set of rules of their own as the Association's standard did not meet with approval.

Apropos of the suggested Municipal Wiring Bill, it is said that the Contractors' Association have a bigger war chest for the probable Parliamentary struggle than the municipalities, in addition to which the question of the legality of municipal funds being applied for such a purpose may be raised when the proper time comes.

Electrical contractors are not pleased with the action of certain large electric supply companies in opening showrooms and doing contracting work, and an eye is being kept upon them, as well as upon the municipalities in this connection.

The Municipal Bill.—Watford is in favour of that portion of the Bill which relates to standby supply and protection against unauthorised undertakers. Battersea is withholding its opinion until the Bill is actually drafted.

Stop-valve Explosion.—A Board of Trade Report has just been issued on a stop-valve explosion which occurred at the Hanley Electricity Works on July 25th. The cover of the valve was forced out of its screwed socket, and through the opening thus formed in the valve chest, steam, at a pressure of 130 lbs. per square inch, escaped until the receiver connections were closed. The cover was so slack a fit in the valve chest that it had only been, hitherto, held in position by the extreme edges of the screw thread, and these ultimately giving way, under ordinary working conditions, the cover was blown out by the pressure of steam in the receiver.

The Institution of Civil Engineers: Yarrow Educational Fund.—This Fund was established to afford assistance to young men who desire to become engineers, who have given proof of their capacity to profit by specialised education and training, but who lack sufficient means to obtain it. Grants varying between £50 and £100 per annum, for a period not exceeding three years, may be made at the discretion of the committee. Applicants for such grants must be of British birth, not more than 21 years of age, and must be prepared to qualify for attachment as Students of the Institution of Civil Engineers. Several vacancies for scholarships under the Fund will occur in March, 1911, and the Council of the Institution are prepared to receive and consider applications therefor. Applications should be addressed to the Secretary of the Institution of Civil Engineers, Great George Street, Westminster, S.W., from whom further particulars may be obtained.

RUBBER BELTING

ONE of the many applications of rubber and similar materials in which the India Rubber, Gutta Percha & Telegraph Works Co., Ltd., specialise, is "Silvertown" Belting, both rubber and balata. They inform us that they have just fulfilled a large contract of this nature to the order of Messrs. Spencer & Co., Ltd., of Melksham, for the Hull & Barnsley Railway Co. Two large rubber belts (shown in the illustration ready for despatch) are to be used for loading vessels with coal at the Hull Docks by a new patent conveyor system which has already been successfully applied by the North-Eastern Railway Co. for the same purpose, and for which Messrs. Spencer & Co. have the sole rights of manufacture and supply. The plant will be electrically driven. The belts are 953 ft. and 929 ft. long, and weigh 12,071½ lbs. and 11,740¾ lbs. respectively.

RUBBER CONVEYOR BELTS FOR THE HULL AND BARNSLEY RAILWAY CO.

The Brennan Monorail.—On Saturday last Mr. L. Brennan, C.B., had the honour of showing a number of Cabinet Ministers the working of his monorail car in the Shepherd's Bush Exhibition grounds. Mr. Asquith, Mr. Lloyd George, Mr. Winston Churchill, and Mr. Augustine Birrell all took part in a ride in the car, and inspected the machinery. Mr. Winston Churchill in particular appeared to take great interest in the construction and working of the car, and assisted Mr. Brennan in his explanations to the other members of the Cabinet. Among others who were present were Mrs. Winston Churchill, Lady Gwendoline Churchill, Miss Violet Asquith, Mr. Raymond Asquith, Sir Ernest Cassel, Sir Edgar Speyer, Lord Basil Blackwood, Mr. George Cornwallis-West, and Mr. Guy Granet. A detailed description of the car appeared in our issue of November 18th, 1909.

New Single-Phase Railways.—The Austrian sections of the proposed "Mittenwaldbahn," which is partly in Bavaria and partly in Tyrol (Austria), are now under construction, and will be opened to service towards the end of 1912. The completed line will provide a shorter route between Munich and Innsbruck *via* Garmisch-Partenkirchen, and though the traffic will be at first of the nature of branch-line traffic, the line is being constructed with a view of ultimately making it a main line. A feature of the line is that for a length of 12 miles there is a continuous gradient of about 3.6 per cent. The trains will be of 100 tons and 200 tons weight, drawn by one and two locomotives respectively. These will be of the six-axle pattern with one large 800-h.p. single-phase motor coupled to four driving wheels through coupling-rods, as in the Dessau-Bitterfeld locomotives of the Prussian State Railways. Current will be supplied at 10,000 volts; the frequency will be either 15 or 25 cycles. A water-power station is being constructed to supply the electrical energy. This will contain two 4,000-h.p. sets supplying current at 50,000 volts to the sub-stations. The whole of the electrical equipment will be supplied by the A.E.G. Union Company of Vienna. The section of the line which is in Bavaria will run from Griesen to Scharnitz *via* Garmisch-Partenkirchen, and will also be worked electrically. The construction of this section has not yet been commenced, however.

ELECTRIC RAILWAY ECONOMICS

Mr. Hobart's Defence of the Continuous-Current System.

A PAPER was read recently by Mr. H. M. Hobart, before the Arc Works Engineering Society, Chelmsford, on the economic aspect of railway electrification, which contained some interesting detailed comparative figures for the continuous-current and single-phase systems, on the relative advantages of which Mr. Hobart is known to have strong views.

The earlier part of the Paper treated generally of the conditions under which electric traction has advantages over steam traction. The main question is that of acceleration. As regards long-distance trains with infrequent stops, the steam locomotive is able to deal with the conditions usually obtaining, but for urban and suburban traffic, when the stops are at all frequent, the maximum accelerations commercially possible with steam locomotives result in a schedule speed so low that the tramcar and motor omnibus provide satisfactory alternatives. A 50-ton steam locomotive, giving a draw-bar pull of 3 tons, will only produce an acceleration of less than 0·2 m.p.h. per sec. on a 200-ton train, whereas with an electrical equipment, also constituting 20 per cent. of the total train weight, an acceleration of 1 m.p.h. per sec. is available, with frequent stops. The great importance of this was illustrated by curves showing that a steam train with an acceleration of 0·4 m.p.h. per sec. can only maintain a schedule speed of some 11 to 12 m.p.h., whereas an electric train with an acceleration of 1 m.p.h. per sec. can provide a schedule speed of some 18 m.p.h. If the distance between stops is one mile instead of half a mile, the schedule speed for the steam train will only be of the order of 17 m.p.h., while the electric train can provide a schedule speed of about 25 m.p.h. The development of steam railways to their present high stage of efficiency has entailed an enormous capital outlay, and this constitutes the chief stumbling-block in the way of the electrification of urban and suburban sections. The extra outlay for conversion to electrical working, taking interest at 4 per cent., has imposed an extra capital burden in various cases of electrification of sections of British railways, and works out as follows :—Tynemouth section of the N.E.R., 1·9d. per train mile; Southport section of the L. & Y.R., 2·0d. per train mile; Mersey Railway, 4·3d. per train mile; Victoria-London Bridge section of the L.B. & S.C.R., 6·4d. per train mile. With the increased train service introduced on the L.B. & S.C.R. on October 1st, the capital burden is reduced from the above figure to about 5·5d. per train mile, and the consummation of the programme now contemplated for this section of railway, will, if the present amount of rolling stock suffices for the intended future service, reduce the capital burden to 4·1d. per train mile. By the use of an appropriate system, the capital burden incurred in electrifying suitable suburban sections of main line railways probably need not exceed 2d. per train mile, but it is impossible to make any definite statement. The strong point of electrification is that, in respect to obtaining high speeds with frequent stops, the results cannot be approached by steam locomotive methods, and these attractive features ultimately produce an increase in traffic which, notwithstanding the large capital outlay and the by no means low operating costs, yields a larger profit in virtue of a greatly increased turnover.

The author then proceeded to work out a typical case in considerable detail, based on the latest results obtainable. The service assumed was for a schedule speed of 25 miles per hour with one stop per mile, which is intermediate between the cases of the Southport section of the L. & Y.R. and of the Victoria-London-Bridge section of the L.B. & S.C.R. The train-mile costs were worked out for two different electrical systems. In one, current is transmitted at high pressure three-phase to sub-stations in which it is converted, in rotating machinery, into continuous current at, say, 600 volts. At this pressure it is supplied to conductor rails. In the other system, single-phase transmission and distribution are employed with overhead contact lines.

The case was taken of ten miles of double track over which it is desired on week-days to operate a 12-minute service of three-coach trains from 6 a.m. until midnight, and to run half this service on Sundays. Ninety trains are despatched in each direction on week-days and 45 trains in each direction on Sundays. This aggregates 610,000 train miles per annum. Eleven trains are provided, each to run 55,500 productive miles per annum. The three-coach trains are 180 ft. in length, and provide 180 seats. The coach bodies weigh 18 tons each. The trucks weigh 6 tons each. Thus, exclusive of the electrical equipment, the weight of each train is 90 tons. For a schedule speed of 25 m.p.h., and with one 20-second stop per mile, the consumption of electricity on test runs will be about 90 watt hours per ton mile, or 2·25 kw. per ton weight of train. The efficiency of the electrical equipment will be about 70 per cent. Thus the average output from the motors will be 2·11 h.p. per ton weight of train.

Up to this point there has been no need to distinguish between systems. Continuous-current equipment yields an average output of about 10 h.p. per ton weight of equipment, while single-phase equipment yields an average output of 5·5 h.p. per ton weight of equipment. Consequently the weights of the equipment per ton weight of train will be 0·211 and 0·384 ton per ton weight of train respectively.

The weights and costs of the two trains are shown in the following table, assuming a cost of £80 per ton for bodies, £22 for trucks, and £125 for electrical equipment :—

	Continuous.		Single-phase.	
	Weight. Tons.	Cost. £.	Weight. Tons.	Cost. £.
Coach bodies	54	4,320	54	4,320
Trucks	36	790	36	790
Electrical equipment	24	3,000	56	7,000
Total weight	114	—	146	—
Cost of assembling and all further costs (at £5 per ton of total weight of train)		570	—	730
Total cost of train		8,680	—	12,840
Cost of train per ton of total weight		76.0	—	88.0
Cost of train per seat		48.1	—	71.4

The outlay for rolling stock is :—For the continuous system, £95,500, and for the single-phase system, £141,000. The cost of the contact conductors (third rail or overhead wire) will depend greatly on the line. It is taken as £2,000 per mile of single track for both systems, or £40,000.

The load factor of the sub-station output may be taken as 20 per cent. Before we can estimate the cost of the sub-station we must estimate the load. Taking the input in actual service as 30 per cent. greater than on test runs, then the input at the train per annum will be 8,150,000 kw. hours for the continuous system, and 10,420,000 kw. hours for the single-phase system, and the maximum loads on the sub-station will be (allowing 98 per cent. efficiency from sub-station to trains) 4,750 kw. and 6,080 kw. respectively. For the continuous system two sub-stations are provided for each for a peak load of 2,375 kw. each, with a rated capacity of 3,000 kw. of machinery. The cost of the two is taken as £30,000. The distributing cabins, which, in the single-phase system, replace the sub-stations, will cost about one-fourth as much per million kw. hours per annum as the sub-stations in the continuous system. On this basis, the capital outlay for the distributing cabins for the single-phase system amounts to £9,600.

The case is taken where electricity is purchased from a supply company, which delivers it to the railway's sub-stations. For the continuous system the railway will receive the electricity at the sub-stations in the three-phase form and at unity power factor. For the single-phase system the electricity will be received at the distributing cabins in the single-phase form and at an average power factor of 0·80. The single-phase electricity will cost the most on account of the greater cost and less efficiency of single-phase generators as compared with three-phase generators, the lower power factor, and the greater cost of the transmission line.

The price of the electricity will vary according to many circumstances. It is only the *relative* prices which will materially affect the results of this comparison. These may fairly be taken for the electricity as delivered to the sub-stations, as 0·62d. for the continuous electricity system, and 0·53d. for the single-phase system. The efficiency of the single-phase sub-stations may be taken as 100 per cent., as these will be merely distributing cabins. The efficiency of the continuous electricity sub-stations may be taken as 89 per cent. Consequently the amount of electricity to be paid for annually will be 9,350,000 kw. hours for the continuous electricity system, and 10,650,000 kw. hours for the single-phase system. At the above prices, the annual outlay for electricity is £24,500 and £30,200 respectively, or 9·7d. per train mile for continuous current, and 11·9d. for single-phase trains. For the annual outlay for repairs and renewals the following figures are taken :—Rolling stock, 8 per cent. for both systems: sub-stations, 6 per cent. for the continuous system; distributing cabins in the single-phase system, 4 per cent.

The repairs and renewals of the contact-conductors, insulators, bonding, feeders, &c., are taken as half as much again for the single-phase overhead system as for the con-

Digitized by Google

tinuous "third-rail" equipment, or 5·0 and 7·5 per cent. respectively.

The annual cost for repairs and renewals thus work out as set forth in the following table:—

	Continuous System.	Single-phase System.
Rolling stock	£7,640	£11,300
Sub-stations	£1,800	
Distributing cabins	—	£380
Conductors, &c.:—		
(*a*) Cont. system	£2,000	—
(*b*) Single-ph. system ...	—	£3,000
Total	£11,440	£14,680
Do. per train mile	4·5d.	5·8d.

For wages of drivers and of sub-station attendants the following figures are appropriate:—

	Continuous	Single-phase.
Drivers' wages per train mile ...	1·0	1·0
Sub-station attendants, inspectors, &c.	0·8	0·4
	1·8	1·4

Summing up these items we have:—

	Continuous	Single-phase.
Outlay for electricity—per train mile	9·7d.	11·9d.
Repairs and renewals:—		
Of rolling stock, sub-stations, conductors, &c., per train mile	4·5d.	5·8d.
Wages of drivers and of sub-station attendants per train mile	1·8d.	1·4d.
Total	16·0d.	19·1d.

The capital outlays in these two cases are as follows:—

	Continuous.	Single-phase.
	£	£
Rolling stock	95,500	141,000
Sub-stations or distributing cabins ...	30,000	9,600
Contact conductors, &c.	40,000	40,000
Tools, buildings, and all further capital outlays incurred	10,000	10,000
Total capital outlay	£175,500	£200,600
Interest on above at 4 per cent. ...	£7,030	£8,050
Interest per train mile	2·76d.	3·16d.
Running and maintenance costs per train mile	16·0d.	19·1d.
Total costs per train mile depending on electric traction ...	18·8d.	22·3d.

Amount by which the single-phase system exceeds that of the continuous electric system ... ... 22·3d. − 18·8d. = 3·5d.

For the three-coach 180-seat train under consideration, the receipts per train mile are unlikely to exceed 36d. If comparisons, however, are worked for three cases, namely, receipts of 34d., 42d., and 50d. per train mile, the amounts which the lesser cost of the continuous system as compared with the single-phase system constitutes of the gross receipts per mile for a 180-ft. three-coach train, expressed as a percentage of the gross receipts, will be found to be 10·3, 8·4, and 7·0 per cent. respectively.

It will be noted, continues Mr. Hobart, that only in the improbable case that the receipts amount to as much as 50d. per train mile, does the difference between the train-mile costs of the two systems decrease to as low as 7·0 per cent. of the gross receipts. Consequently it follows that the use of the continuous-current system in preference to the single-phase system for a service of this sort, permits of the allocation of at least 7·0 per cent. more of the gross receipts to reserves, dividends, &c.

The only capital costs which have been worked out have related to the electrical equipment, including sub-stations, contact-line installation, and rolling stock and its equipment. These items aggregate only £176,000 and £201,000 for the two respective systems. But the chief capital outlays are in addition to these relatively small sums. These further capital outlays will vary widely, and may, for such a ten-mile urban or suburban route, be anywhere from £500,000 to £2,000,000, according to the locality and the type of road. A higher expenditure, such as for a subway or for a deep-level tunnel (which, for a ten-mile road, would run to from £4,000,000 to £7,000,000), could not be made to pay with so light a service as is represented by an average of only five trains per hour in each direction. Let us consider a case where the further (and chief) costs amount to £1,000,000 for a ten-mile road. The corresponding total costs are:—For the continuous system, £1,176,000; and for the single-phase system, £1,201,000. The aggregate gross receipts will be £86,000, £107,000, and £127,000 respectively, for 34d., 42d., and 50d. per train mile.

We have already seen that the items in the total costs which are affected by the type of electrical system employed amount to 18·8d. per train mile for the continuous system, and 22·3d. per train mile for the single-phase system. Taking the cases where the remaining costs are respectively 16d., 20d., and 24d. per train mile, as these values cover the range which would apply to such a road and with such conditions of traffic, the total costs per train mile are:—

	Continuous System.	Single-phase System.
Case A.—When remaining costs are 16d. per train mile	34·8d.	38·3d.
Case B.—When remaining costs are 20d. per train mile	38·8d.	42·3d.
Case C.—When remaining costs are 24d. per train mile	42·8d.	46·8d.

The corresponding total costs per annum are given in the following table:—

Total Costs per Annum.

	Continuous System.	Single-phase System.
Case A	£88,600	£97,500
Case B	£99,000	£107,700
Case C	£109,000	£118,000

The net profit, or net loss, of the capital outlay, is shown for all these cases in the following table:—

	Receipts per train mile.	Continuous System. Profit or Loss.	£.	per cent.	Single-phase System. Profit or Loss.	£.	per cent.
Case A.	34d.	Loss.	2,600	0·22	Loss.	11,000	0·92
	42d.	Profit	18,400	1·57	Profit	9,200	0·77
	50d.	Profit	38,400	3·27	Profit	29,500	2·46
Case B.	34d.	Loss.	13,000	1·10	Loss.	21,200	1·76
	42d.	Profit	8,000	0·68	Loss.	700	0·05
	50d.	Profit	28,000	2·38	Profit	19,300	1·60
Case C.	34d.	Loss.	23,000	1·96	Loss.	31,500	2·60
	42d.	Loss.	2,000	0·17	Loss.	11,300	0·94
	50d.	Profit	18,000	1·53	Profit	9,000	0·75

So long as electrified sections constitute only a small portion of the suburban mileage of a main-line railway, the effect of small variations in the profit or loss on the finances of the entire railway may be negligible, but with extensions of the electrified sections the effect of the use of the less-economical system will become much more manifest. It will be observed that in no instance is the return on the investment satisfactory. This draws our attention to another attribute of electric traction, namely, that an urban or suburban line involving large capital outlay, must be intensely utilised. In other words the train mileage per annum, per mile of line, must be high. Thus in the Underground and Tube Railways in London, which have cost well on toward £1,000,000 *per mile*, as against the £100,000 *per mile* of our example, and with a service, at certain times of the day, of 40 long trains per hour in each direction, there is an almost negligible margin between receipts and total costs. By doubling the frequency of the trains, that is, by operating a service with an average of 10 trains per hour in each direction (instead of only 5), then, assuming that double the number of passengers can be induced to travel (*i.e.*, assuming the same receipts *per train mile*) the profits will increase to much more attractive proportions. This will be particularly the case for the continuous electricity system, since the 100 per cent. increase in the rolling stock will, with the continuous electricity system, involve a smaller increase in the capital burden than is involved in a 100 per cent. increase in single-phase rolling stock.

The results in this Paper, concludes Mr. Hobart, only apply to the particular service selected for the example. The less frequent the trains, the lower the speed and the greater the distance between stops, the less unfavourable to the single-phase system will be the results of such a comparison, but the less also is then the desirability of employing electricity, and by the time the point is reached where the single-phase system, as at present developed, is more economical than the continuous-electricity system, the conditions are such that (except for very special cases) steam-locomotive operation constitutes at present the most economical system.

The Turin Exhibition.—Arrangements for the British section at the International Exhibition, to be held at Turin next year, are well in hand at the Exhibitions Branch of the Board of Trade. The site of the exhibition is at the end of the Corso Vittorio, Emanuele II., extending along both banks of the river and into the Valentini Park, quite close to the Porta Nuova central railway station.

PROGRESS IN TELEGRAPHS AND TELEPHONES

The Postmaster-General's Annual Report.

THE annual report of the Postmaster-General for the year ended March 31st, 1910, devoted to telegraphs, records an increase of 2·4 per cent. in the total number of telegrams as compared with the previous year; 214 new post offices have been opened for telegraph business. Improved forms of apparatus are receiving attention. Modern keyboard perforators have greatly enhanced the utility of the Wheatstone automatic system, and the use of printing telegraph apparatus is receiving special attention. A satisfactory trial has been made of Undulator apparatus on the Bristol-Cork circuit, with a view to avoiding the use of repeaters on submarine cable circuits. The main underground line to the West has been completed, and the wires between London and the landing-places of the important cables starting from the West of England have now been diverted to the underground route. The northern underground line has been completed to Edinburgh; a section of underground work from Aylesbury to Coventry has been laid down, completing the second London-Birmingham underground cable; additional pipes and cables have been laid down between Manchester and Warrington, Manchester and Ashton, and Manchester and Stockport; and pipes have been laid between Leeds and Stockton, Chatham and Canterbury, and Berkeley and the City boundary of Gloucester. During the present financial year it is hoped to lay pipes from Gloucester to Worcester, from Leeds to Hull, and from Canterbury to St. Margaret's Bay, and Abbot's Cliff, the landing-places of Continental cables, and cables from Berkeley to Worcester and from Stockton to Leeds. The cable from Stockton to Leeds will complete the line from Warrington to Newcastle; and the pipe work from Gloucester to Worcester and the cable from Berkeley to Worcester will complete the underground connection between Bristol and Birmingham.

In connection with foreign telegraphs, it is mentioned that quadruplex working with the Baudot instrument has been experimented with successfully on two of the Anglo-Netherland wires. It is proposed to make the arrangement permanent after the completion of certain rearrangements now in progress at the Central Telegraph Office, by which the space allotted to the Continental wires will be increased. Arrangements have been made for the acquisition of the Anglo-Norwegian telegraph service by the two Governments from January 1st, 1911, a new cable, which will be the joint property of the two Governments, being laid between Newbiggin and Arendal.

With regard to wireless telegraphy, reference is made to the acquisition of the following coast stations from the Marconi Co. and Lloyd's:—Caister (Norfolk), North Foreland (Kent), Niton (Isle of Wight), Lizard (Cornwall), Seaforth (Liverpool), Rosslare (Wexford), Crookhaven (Kerry), Malin Head (Donegal). The sums paid to the Marconi Co. and to Lloyd's were £15,000 and £2,400 respectively. Steps are being taken with a view to establishing before long a ring of thoroughly equipped stations round the coast of the United Kingdom. The number of radiotelegrams dealt with during the year at the stations which are now in the hands of the Post Office was as follows:—Outward radiotelegrams to ships, 3,266, as compared with 1,817 in 1908-9; inward radiotelegrams from ships, 27,727, as compared with 22,732 in 1908-9.

Some interesting particulars are given of the trunk line telephone service. There are now 643 trunk exchanges and 2,666 trunk circuits. The Post Office are continuing their extensions in the less populous parts of the country, and arrangements have been made for the National Telephone Co. to proceed with extensions in the outlying parts of areas served by their system. Reference is made to the new Glasgow exchange (see ELECTRICAL ENGINEERING, August 18th, p. 531), and statistics are given of the London system, which now embraces 64,200 subscribers, originating about 70 million calls per annum.

The following paragraph concerning certain criticisms is worth quoting in full:—

"The finance of the Post Office telephone system has recently been the subject of some criticism, and in particular considerable publicity has been given to a statement, originally made at the annual meeting of the National Telephone Co., that the average cost of construction per telephone station was about £52 for the system of the Post Office as compared with about £30 for the National Telephone Co.'s system. In this calculation it appears to have been overlooked that the expenditure taken as the cost of the existing Post Office telephone stations included a sum of about £1,000,000 expended in providing plant for the use of the National Telephone Co. This sum should, therefore, have been added to the Company's expenditure, raising the average cost by about £2 per station. A corresponding deduction would reduce the Post Office expenditure by about £11 10s. per station. Expenditure on land and buildings seems to have been excluded from the Company's cost per station and included in the cost attributed to the Post Office system. Part of the Post Office expenditure has been for plant to replace the Company's overhead wires and cables, and some of their older exchanges, after the transfer of their system to the Post Office at the end of 1911. About 65 per cent. of the Post Office stations are in London, where a very costly underground system has been provided, and the average length of the lines in use is about double the length of the lines on the Company's general system. The Post Office has also provided all the underground junction wires for communication between the exchanges of the two systems in London."

CATALOGUES AND PAMPHLETS, &c., RECEIVED

WIRES AND CABLES.—The St. Helens Cable & Rubber Co., Ltd. (Warrington) are issuing an advance list of vulcanised rubber-covered wires and cables with revised prices. This contains particulars of "Association" and "non-Association" cables of all sizes. A complete new list will be issued in December.

ARC LAMPS.—The Abbey Electric Co. (17 Victoria Street, S.W.) have issued an attractive list of their latest forms of long-burning flame arc lamp, which range up to a size running for 40-45 hours, only 48 ins. in length over all, and without any magazine arrangement. This is a double carbon lamp with a ratchet feeding arrangement controlled by shunt and series coils. The mechanism was described in some detail in ELECTRICAL ENGINEERING, April 14th, page 245.

MACHINE TOOL DRIVING.—A large and most handsomely got up pamphlet, entitled "Machine Tool Driving," is being issued by the Electric Construction Co. (Dashwood House, 9 New Broad Street, E.C.). This contains illustrations typical of a number of patterns of motors made by the Company, most of which, we note, are now fitted with ball bearings. A series of photographs are also reproduced showing these motors applied to the individual driving of modern machine tools of large size and other forms of drive, such as group drive by belting of wood-working machinery. A list of some typical E.C.C. motor installations is also given.

THE I.C.S. STUDENT.—We have received from International Correspondence Schools, Ltd. (Kingsway), a copy of the first weekly issue of their magazine with the above title. This takes the form principally of a register of vacancies in prominent firms, and should prove useful to students who have completed their courses of instruction.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ACCUMULATOR ACCESSORIES.—A revised price-list from Messrs. Cookson & Co., 59-61 New Oxford Street, W.C., deals with accumulator plates, and such accessories as indiarubber corks, collars, &c., glass vents, and hydrometers, together with complete cells of small and moderate size. A list of electric motor-car and cycle lamps is also given.

FITTINGS.—Furthering their activities in the direction of electric lighting, the Welsbach Incandescent Gas Light Co., Ltd., have issued through their electric light section (344-354 Gray's Inn Road) a handsome and complete catalogue of electric fittings. This includes a long series of plain and ornamental brackets, table and floor standards, electroliers and chain pendants, the latter especially including some very attractive designs. There is also a considerable choice of dining room and dressing table counter-weight pendants, as well as ceiling fittings and ordinary flexible cord pendants, hall lanterns, &c. The above refer to house fittings, but water-tight and exterior fittings are dealt with in the latter part of the catalogue. A very complete selection of shades is included, and other articles dealt with include lamp holder switches, plugs, adaptors, &c., hall fittings, ceiling roses, and cut-outs. A few designs of radiators of the lamp pattern are included.

HEATING AND COOKING APPARATUS.—A new catalogue of their well-known "Quartzalite" heating and cooking apparatus (see ELECTRICAL ENGINEERING, Vol. V., page 631) is being issued by the Bastian Electric Heating Syndicate, Ltd. (91-93 Palmerston House, E.C.). This contains particulars of the construction of a number of forms of heaters for rooms, as well as ovens, toasters, water-heaters, irons, hot plates, and a new coffee percolator, in which the Bastian patent heating units, consisting of wire spirals embedded in quartz tubes, are used. An effective show-card calling attention to these heaters has also been prepared, and this and the catalogue can be obtained from any of the wholesale agents, among whom are Messrs. Drake & Gorham, Ltd. (66 Victoria Street, S.W.), Messrs. Johnson & Phillips, Ltd. (14 Union Court, Old Broad Street, E.C.), the British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester), the Wardle Engineering Co., Ltd. (196 Deansgate, Manchester), the Electrical Co., Ltd. (121 Charing Cross Road, W.C.), and Electrical Installations, Ltd. (27 St. Martin's Lane, W.C.).

The Royal Society of Arts.—Among the forthcoming lectures are the following:—November 23rd, "Modern Methods of Detecting Firedamp in Mines," by Sir H. H. Cunynghame; November 21st and 28th, and December 5th and 12th, a course of Cantor lectures by Mr. C. R. Darling on "Industrial Pyrometry"; March 6th, 13th, 20th and 27th, a course of Cantor lectures on "Applications of Electric Heating," by Prof. J. A. Fleming, F.R.S.

CORRESPONDENCE

POST OFFICE TELEGRAPH AND TELEPHONE FINANCE.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—That tardy annual, the Postmaster-General's Report on the Post Office for the year ending March 31st, has just made its appearance. A few years ago it was available in August, but it is gradually becoming a Christmas publication. In view of the approaching creation of an exclusive Post Office monopoly in the telephone, the financial results of the present telegraph and telephone work of the Post Office are of interest to business men and political economists. Summarised, they are as follows:—

Capital Expenditure.		
Telegraphs	£18,523,019	
Telephones	£10,138,128	
Total ...		£28,661,147
Gross Revenue.		
Telegraphs	£3,166,192	
Telephones	£1,391,377	
Total ...		£4,557,569
Working Expenses.		
Telegraphs	£3,568,203	
Telephones	£1,026,933	
Total ...		£4,595,136

The excess of expenditure over revenue for the year was therefore £37,567.

The working expenditure of the telegraphs was 113 per cent. of the gross revenue. The working expenditure of the telephones was 73·8 per cent. of the gross revenue. The working expenditure of the combined undertakings was just over 100 per cent. of the gross revenue. All capital charges on 28½ millions of capital have to be met from other sources than the earnings of the combined undertakings. Interest on the original capital of the telegraphs, £10,800,000, is paid out of the Consolidated Fund. On the capital added since the purchase capital account was closed, many years ago, no interest is paid. Interest and sinking fund on telephone capital is paid partly by net telephone revenue and partly by royalties from licencees; the royalties for the past year amounted to £320,590, or almost as much as the net revenue of the whole telephone business of the Post Office.

The actual net telephone revenue, arising from the trunk line system, the London system, and the provincial systems of the Post Office amounted to £364,444, or 3·55 per cent. on the total telephone capital of £10,138,128. The amount required for interest and sinking fund on telephone capital was £767,007, so the net telephone revenue failed to meet capital charges for the year by £402,563.

It is to a Department which produces from a technical industry financial results such as these that the political authorities now propose to entrust the entire telephone business of the country.

I am, Sir, yours faithfully,

HERBERT LAWS WEBB.

35 Old Queen Street. S.W.
November 4th, 1910.

PRACTICAL EDUCATION

MR. C. FARADAY PROCTOR gave the above title to his inaugural address as chairman of the Newcastle Section of the Institution of Electrical Engineers, which was devoted principally to a plea for improvement in the methods of education adopted in this country. As Sir G. Reid had said at the recent meeting of the British Association, modern students' knowledge was often too much of the nature of a gramophone record. The memory was cultivated at the expense of the intelligence. The present system tended to regard the successful passing of an examination as a proof of the scholar's knowledge. Mr. Proctor contended that it only proved his ability to pass examinations, and that the true proof of the efficiency of his education was his ability to earn a good living for himself, and a social position somewhat better than that which he would inherit from his parents. He deprecated the neglect in the teaching of drawing, and repeated Sir John Gorst's dictum that "book schools" should be replaced by "work schools."

He then passed on to show by one or two examples how little use the class of knowledge obtained by examination passing was without trained powers of observation. Ideas of manufacturing processes gleaned from text-books gave little help in battling with difficulties in practice due to variety of conditions. He thought that it was very striking how large a percentage of engineering college students adopted the teaching profession, and how few were at actual engineering work. He had been told that in Germany the clear understanding of a problem was regarded as of paramount importance. It was to the superior methods of technical education that he attributed much of passage of business in the electrical and other industries from this to other countries, and several examples were given of large orders which have been placed abroad, and industries which had practically left the country.

He asked why could not we only teach the bare essential principles of economic life to the masses, and give special assistance to those showing a real aptitude for study, and at the same time give more attention to the ability of the teacher to teach rather than his ability to learn, as shown by the passing of examinations in subjects they are never likely to require during their teaching duties.

Some people suggested other reforms than a more practical education, and, indeed, one large manufacturer who often advocated drastic reforms of at least as revolutionary a character), had proved that even the long-established Continental business of telephone making could be wrested from the foreigner (who had the advantage of good wood supplies), and conducted at a profit in England. He contended that the secret was simply a good combination of capital, labour, theory and practice, backed, of course, by good commercial ability.

Mr. Proctor then passed on to point out the absurdities of our systems of weights, measures, and coinage, and commended the action of the American Electrochemical and other societies in insisting that all papers containing English measures have the corresponding metric values given as well. He wished that their own Institution would follow this example.

WATER POWER IN TASMANIA

MR. F. A. M'CARTY, the well-known electrical engineer in Australia, has been in Hobart recently in the capacity of consulting engineer to the Complex Ores Co., and during that time he made a close examination of the Great Lake and the site upon which it is proposed to build the company's generating station. The following is an extract of his report:—

I visited the lake last Tuesday, and I inspected the proposed site of the dam or weir and found it to be a most suitable place for erecting a weir. It can eventually, if the company thinks fit, be raised, approximately, to a height of 16 ft., although I understand the company only contemplates erecting a dam 4 ft. high at the start. The area of the lake is, approximately, 26,000 acres, and from a rough calculation I found that a 6-in. rise on the lake, without counting on any supply coming in or making allowance for any evaporation, would run a plant generating 24,764 h.p. for 31 consecutive days. On this basis, with a dam 4 ft. high, built as the company proposes, enough water could be conserved to run the plant for eight months without any additional supply. For example, suppose there was an eight months' drought—an unprecedented thing in the lake district—enough water could be stored with that 4-ft. dam to run that huge plant for the period I mention. The evaporation and other losses which would take place would be compensated for by the ordinary supply coming in during this time. If the dam were raised to 8 ft., we could generate without any further expense, 50,000 horse-power, and with the diversion of the upper waters of the Ouse into the lake I calculate 100,000 horse-power could be generated without trouble. With suitable damming enough water can be stored at the lake to last out an eight months' drought. With the great lake harnessed, it will be possible to generate enough power to run the whole of the Government railways, even those in the remotest part of the State, and then have enough left over for the industries in the city and other places. With the low rates to be charged, it will be possible to build up industries here to supply the needs of other parts of Australia. Amongst the few industries which I hope to see established is the manufacture of iron and steel by electric furnace, the production of aluminium, nitrates, and calcium carbide.

In connection with this matter, gratifying progress is being made with the details of a scheme for utilising the water power for industrial purposes. The Complex Ores Co., of Melbourne, which have acquired the powers to instal a plant for the production of electricity, state that units of 5,000 h.p. will be installed as required. At the fall into the Ouse, where the power station will be located, metallurgical works are to be erected, and run by the company. This will gradually absorb one unit of 20,000 h.p. The plant to be installed will be of the latest type and design, and as much as possible will be made in the Commonwealth. It is estimated that a capital outlay of over £200,000 will be required to carry out and complete the first unit proposed to be installed, including headworks, power station, transmission lines, services, and metallurgical plant.

Digitized by Google

LOCAL NOTES

Beckenham: *Proposed "Model" House.*—The Borough Electrical Engineer has been authorised to make a provisional arrangement with reference to the exhibition of electrical appliances in a "model" house which is to be provided by the owners of a local building estate.

Birmingham: *Additions to Showroom.*—A demonstration of electrically-driven machinery has been arranged in the Dale End showroom in order to show the manner in which electricity can be applied to the driving of machinery as apart from domestic applications. The Corporation, having introduced the supply of three-phase current for power purposes, have equipped the showroom with three-phase machinery, and among the apparatus on view is a welding plant, a rolling mill, shearing machine, &c. A number of small apparatus, including drills, polishing machines, grinders, &c., are driven by direct current motors. In all cases, the machinery has been loaned by manufacturers.

Bray: *Municipal Wiring.*—The Dublin & Alliance Gas Consumers' Co. have written to the Council stating that they are informed the Council are wiring premises for electric light, and pointing out that the Council do not possess any statutory powers in this connection. The letter was placed before the Council last week, when it was stated that the company have been misinformed.

Limerick: *Condition of Electricity Plant.*—Mr. Aubrey Clayton, of London, was recently called in by the Council to report generally upon the electricity undertaking. He states that the entire undertaking from beginning to end is in a most exceedingly neglected and dirty condition, and in many places in a bad state of repair. Moreover, there appeared to be an entire lack of system and discipline in all departments. The gas producers were working very inefficiently, the switchboard was in a most neglected and dirty condition, and the lids of the distribution boxes were loose and not watertight. In one case, the lid was missing altogether. Many other criticisms of a like character were made, including the statement that one of the brickwork chambers of a distribution box was found "half filled with clay, and crawling with worms and insects." The mains are said to be in good condition. Mr. Clayton suggests the installation of a battery. The result is that Mr. McNamara, the resident engineer, has been called upon to resign.

London: *London County Council: Invention by Official.*—Mr. W. E. Ireland, the Rolling Stock Superintendent of the L.C.C. tramways, has patented an improvement in tramway brake-gear.

Tramways.—A deputation of four members of the Paris Council is at present visiting London in order to study the tramway system of the County Council.

West Ham: *Electricity Accounts.*—The accounts of the Electrical Department for the year to March 31st, as we have already announced, show a debit balance of £93. The total number of units sold during the year, namely, 19,156,399, was increased by 3,634,322, 43 per cent. of which was due to power and heating. The total revenue from all sources increased from £72,114 to £79,454. The cost of maintenance increased by £1,617, due to expensive repairs and special overhauling, whilst the cost of coal increased by £2,249 in consequence of the increased output. The important factor which has told against the undertaking is rating, which shows an increase of no less than £5,207 for the year, but the under-valuation of the Electricity Department has been commented upon at Local Government Board inquiries from time to time. In a few remarks upon the Sales Department, Mr. Couzens states that the work has been very seriously handicapped, due to the many changes in the staff and the difficulty in obtaining assistance with previous experience, as departments on these lines are not common. He regards the function of a Sales Department not so much to show a profit, as to increase the sale of electricity, and benefit the undertaking as a whole.

Winchester: *Purchase of Supply Co.'s Undertaking.*—In connection with the arbitration proceedings for the purchase of the Winchester Electric Light & Power Co.'s undertaking, Mr. C. H. Merz has been retained by the Corporation as Consulting Engineer.

Worthing: *Tramways.*—In spite of the opposition of the Brighton Corporation, and of a large section of the Hove ratepayers, the promoters of the suggested tramways between Brighton and Worthing are said to intend to proceed with their application in Parliament for the necessary powers.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Ashford.—The East Kent Electric Supply Co., Ltd., have asked for the Council's consent to an application for an electric lighting Provisional Order.

Barking.—Extensions are to be carried out at the Electricity Works. A scheme for removing the Works to another site has not been approved. A loan of £11,000 is to be applied for.

Bispham.—Tenders are invited for gas engines, dynamos, switchboard, balancers, boosters, storage battery and mains. Particulars from Mr. J. W. Speight, Consulting Engineer, The Elms, St. Ann's-on-Sea.

Gloucester.—The Electrical Engineer recommends the installation of a 750 kw. turbo-alternator, condenser, switchgear, &c.; mechanical stokers for two boilers; steam feed pump; a 150-200 kw. motor-generator with switchgear, &c.; also feeders, distributing mains, and services, at a total estimated cost of £14,322.

Kildare.—An additional generating set is to be installed, and a loan of £500 applied for.

Llandudno.—Application has been made for a loan of £2,320 for electrical extensions.

London: *Hackney.*—Further extensions of mains are to be carried out in the Springfield district at an estimated cost of £100.

Luton.—Mains are to be extended at an estimated cost of £2,393.

Radnor.—It has been decided to install a small electric lighting set at the Talgarth Asylum.

Walthamstow.—Tenders are invited by November 25th for a 1,000-kw. mixed-pressure turbine with tandem generators of 500 kw. each, with surface condenser, pipe-work, &c. Particulars from Mr. G. R. Spurr, Electricity Works.

Wolverhampton.—An inquiry was held on Tuesday concerning a loan of £20,900 for electrical extensions. The loan is made up as follows:—Land, £1,400; generating plant, £10,845; additions to destructor, £4,200; new workshops and equipment, £1,850; services, £1,000; excess expenditure, £807; and contingencies, £807.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Conversion of Hanover Chapel, Peckham Road, to electric theatre.

Public Library in Woodland Street, Dalston.

Music Hall, 444/446, Fulham Road.

Alterations and extensions at Gospel Oak rink, Mansfield Road, Hampstead.

Surrey Vaudeville Theatre, Blackfriars Road.

New wing to Monastery in Khedive Road, Forest Gate.

Children's Home. The Guardians, Richmond.

PROVINCES.

Barnsley.—Extensions to York Street Public Baths.

Bradford.—Wool warehouse, Sunbridge Road. Architect, Mr. R. Calvert, Foster Square.

Bury.—Alterations and additions to St. Chad's Schools.

Canterbury.—Electric lighting of workhouse.

Doncaster.—Church in Hallgate.—New Sorting Office. H.M. Office of Works, London.

Glasgow.—Stores and offices at corner of Garscube Road and Firhill Road. Architect, Mr. Neil Duff.—High School for Girls in Kinggarth Street. Architects, Messrs. Thompson & Sandilands.—Alterations and additions to Messrs. Bell's works, 45 McFarlane Street.

Leeds.—Two hostels for men students at City of Leeds Training College. Architect, Mr. S. D. Kitson, Vicar Lane.

OSRAM·LAMPS

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published November 3rd, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

22,988/09. **Pendant Chain Suspension.** R. J. SIMPSON (Acock's Green, Worcestershire). Chains for suspending lamp fittings are constructed with hollow links split longitudinally and provided with means for fitting together. The leads to the fitting pass through alternate links and through openings in the ends of these. The links between the hollow ones may be integral with them, or may be simple solid links with holes at each end for the leads to pass through. Ten figures.

23,014/09. **Arc Lamp.** J. NEU (Nuremburg). In flame lamps of the type in which one electrode rests upon a fixed stop, this stop is pivoted, and provided with a counterweight so that it tips up when the pressure is released owing to the carbon being entirely consumed. This action is caused to cut the lamp out of the circuit or to insert a substitutional resistance. Six figures.

23,216/09. **Resistances.** A. W. MALEY (West Bromwich, Staffs). Resistance grids are stamped out of sheet steel, or consist of steel wire wound zig-zag. The grids are stamped or wound in a continuous series, and are then bent upon themselves so as to form a compact rheostat without intervening joints. Three figures.

23,818-9/09. **Heating and Cooking Apparatus.** G. G. BELL and J. V. PLETTS (London). These patents relate to cooking apparatus in which the heat is stored up in an isolated body of material, and conducted away when required. According to the first specification, water pipes are embedded in the heat-storing body, and form a closed circulating circuit with pipes placed in an oven either inside or adjacent to the body. The latter pipes are arranged helically to form one or more hot plates, on which the cooking utensils can be placed. The heating element is embedded in the heat-storing body, but an additional element may be placed in the oven. Four figures.—The second specification describes an electric oven with a vent pipe for allowing the products of ebullition to escape. Special utensils are employed, each having a pipe or vent in the lid communicating with this outlet. One figure.

23,980/09. **Street-Lantern Support for Metal Filament Lamps.** H. T. HARRISON (London). In an anti-vibration support for metal filament lamps in street and other lanterns, the lamp-holder is provided with a metal flange, and this is supported inside an insulating hood of inverted cup-shape by means of three or more spiral springs arranged radially and horizontally between the flange and the hood. Two or more such supports may be fixed together to form a group fitting. Six figures.

27,478/09. **Control of Polyphase Machinery for Marine Propulsion.** H. A. MAVOR and MAVOR & COULSON, LTD. (Glasgow). This specification describes an alternator designed to generate polyphase current at two different frequencies without any change in speed. The stator is provided with two windings, and the rotor has a special winding which produces a compound magnetic field equivalent to the resultant of two independent fields of different pole numbers. Current at any one frequency can be taken from the corresponding stator winding without altering the rotor connections. Eight figures.

30,000/09. **Sign Switch.** H. F. REASON and REASON MANUFACTURING CO., LTD. (Brighton). An automatic sign switch for heavy currents and with means for adjusting the time intervals consists of two solenoids connected in series, and arranged vertically one over the other. The circuit is completed through the two cores. When the circuit is closed, the cores rise together until the lower one reaches the top of the lower solenoid, when it falls, thus breaking the circuit. The upper core is retarded in its fall by being geared by means of a rack to a fly-train. When the upper core touches the lower one again, the circuit is closed, and the operation repeated. Three figures.

10,210/10. **Relay for Wireless Telegraphy.** W. P. THOMPSON (*Gesellschaft für Drahtlose Telegraphie, Berlin*). In order to be able to receive very weak signals, an oscillating relay is used in combination with a local telephone circuit. The relay consists of a light oscillating armature supported on two stretched wires, and having fixed to it one electrode of a sensitive carbon microphone contact. The armature is tuned to the periodicity of the received signals and resonates to them, the resultant parallel movement giving a good microphone action at the contact. Several such relays may be connected in series with their armatures tuned one to another. Magnetic control of the sensitiveness of the relay is provided. Several combinations in which a transformer and rectifier are used in the circuit of the last relay of a series for the purpose of operating a registering device are described. Sixteen figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: TAYLOR [A.-C. to D.-C. transformation and reverse] 20,867/09; SIEMENS BROS. & Co. and DIESELHORST [Cables] 1,194/10 and 3,818/10; WITZENMANN [Armouring of cables] 10,036/10; ST. HELENS CABLE & RUBBER CO., TAYLOR and BROOKING [Composite plates of hard rubber and metal] 11,664/10.

Dynamos, Motors, and Transformers: MIDGLEY and VANDERVELL [Machines] 16,447/09; MILCH [Control of induction motors] 16,559/09; SCOTT [D.-C. motors] 24,023/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Machines] 24,126/09; PARSONS and LAW [Regulation of A.-C. machines] 24,127/09; CARTER [Machines] 24,434/09; SIEMENS BROS. DYNAMO WORKS and KLOSS [Electrical marine propulsion] 25,734/09; A.-G. BROWN, BOVERI & CIE. [Single-phase motors on polyphase systems] 645/10; MEYNIER [Machines] 10,208/10; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Centrifugal compressors] 12,858/10; ALLGEMEINE ELEKTRICITÄTS-GES. [Windings] 14,862/10, and [Centrifugal compressors] 17,474/10; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckert werke Ges.*) [Commutators] 19,539/10.

Electric Ignition: ÉTABLISSEMENTS DE DION-BOUTON [H.-T. magnetos] 2,883/10; PARSONS [Driving of magnetos] 3,125/10; R. BOSCH [Magnetos] 6,653/10.

Electrometallurgy and Electrochemistry: PIESTRAK [Sterilising liquids by ozone] 1,117/10; KAISER [Production of oxygen nitrogen compounds] 20,325/10.

Instruments and Meters: STEWART [Magnetic speedometers] 1,915/10.

Switchgear, Fuses, and Fittings: MIDDLEDITCH [Prevention of corrosion of terminals] 29,773/09; R. BOSCH [Cable terminals] 11,600/10.

Telephony and Telegraphy: BRITISH RADIO TELEGRAPH & TELEPHONE Co. and BALSILLIE [Wireless telegraphy] 27,395/09.

Traction: IRELAND [Shields for axle-boxes] 24,617/09; FANNIN and NELLIS [Operating tramway points] 5,823/10; STROMEYER [Brake shoes] 17,276/10.

Miscellaneous: DE FERRANTI [Gyroscopic stability mechanism] 24,112/09; JEVONS [Electric welding] 24,958/09; KELVIN & JAMES WHITE, LTD., CLARK and CHETWYND [Compass] 25,718/09 and 27,181/09; TEXTILE APPLIANCES, LTD. and CARVER [Jacquards] 4,312/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: R. BOSCH [Magnetos] 18,095/10; UNTERBERG & HEMLE [Contact-breaker] 22,040/10.

Electrochemistry: RUMPLER [Treating aluminium before electro-deposition] 23,559/10; KÜTTNER [Forming insulating film on aluminium wire] 23,675/10.

Incandescent Lamps: WEBER [Mercury-carbon filament lamp] 9,250/10.

Miscellaneous: BERGER [Electric pendulum clock] 23,569/10.

Opposition to Grant of Patent

14,898/09. **Conduit Manhole Cover.** R. AMES. This patent has been allowed in spite of opposition. It relates to a manhole cover designed to prevent the disintegration of the asphalte or macadam paving at the edge.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

25,402 of Nov. 12th, 1896. **Steam Boilers.** J. H. ROSENTHAL (London). This patent covers the combination, with a water-tube boiler, of a superheater composed of doubled tubes placed in the combustion chamber and connected to cross tubes resting on the headers, and having separate pipe connections to the boiler steam space, and to the water space of the drum.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: H. LEITNER [Train-lighting system] 16,048/03; W. J. ROLLO [Ceiling fan motors] 16,072/02.

Electrometallurgy, &c.: J. HARGREAVES [Electrolytic apparatus] 17,161/97.

Traction: H. FROOD [Brake blocks] 16,222/04.

Miscellaneous: J. P. and G. M. STUBBS [Automatic-feed weighers] 14,477/01; BRITISH THOMSON-HOUSTON Co. (*C. G. Curtis*) [Steam turbines] 15,872/03 and 16,212-3/03; ELEKTRICITÄTS A.-G. VORM. W. LAHMEYER & Co. [Speed regulators and reversing gear for electric winding engines] 11,965/04; SOC. L. GAUMONT & CIE [Synchronous driving of cinematographs and phonographs] 15,708/04; T. WHITTLE [Automatic electric ship's progress indicator] 14,706/05.

Digitized by Google

Maidstone.—Manual instruction room, &c., at Boys' Grammar School.—Alterations at Girls' Grammar School. Architects, Messrs. Ruck, 86 Week Street.

Paisley.—Additions and alterations at Dolter & Co.'s works, Hawkhead Road.

Rochdale.—Music Hall on site of Mason's Foundry.

Southend.—Drill Hall, instructor's quarters, &c., at Prittlewell.—Also additions to Drill Hall, York Road. Colonel F. F. Johnson, C.B., Bank Chambers, Chelmsford.

Staffordshire.—Roman Catholic Schools, George Street, Balsall Heath.

Stourbridge.—St. Thomas's Church is to be wired for electric lighting.

Todmorden.—New school at Castle Hill. Architects, Messrs. Sutcliffe & Sutcliffe.

Tonbridge.—New school. Kent Education Committee.

Tunbridge Wells.—Permanent County School for Girls.

Wakefield.—Alterations to Castleford Wesley Street School. Education Architect, County Hall.

Worcester.—Extensions to infirmary.

MISCELLANEOUS

Beckenham.—A Local Government Board inquiry was held last week concerning a loan of £11,000 for electrical extensions, of which £5,000 are for mains and services, £1,000 for meters, and £5,000 for free wiring. Mr. H. R. Hooper, the Inspector, made a number of inquiries with regard to the position of the capital account, and at one time threatened to suspend the inquiry until he obtained the required particulars. The Clerk complained that other inspectors wrote beforehand and intimated the particulars they would require, but Mr. Hooper had not done this, and he threatened to communicate with the Local Government Board as to whether Mr. Hooper was following the correct procedure in threatening to suspend the inquiry. With regard to some criticisms by the Inspector as to the high capital charges, namely, 2·5d. per unit, it was pointed out that this includes all the free wiring loans which are being repaid on a ten years' basis. The Inspector pointed out that the Council had already spent £27,000 on free wiring, and it was time to see whether the undertaking was a success. Eventually the inquiry was adjourned pending the receipt of the information asked for by the Inspector.

Brighton.—The Tramways Committee require 50 tons of British Standard No. 4 rails. Town Clerk.

Great North of Scotland Railway Co.—Tenders are invited for a six or twelve months' supply of stores, including electric lighting materials. Particulars from the Stores Superintendent, 80 Guild Street, Aberdeen.

London: *County Council.*—Tenders are invited for the overhead electrical equipment required in connection with the construction of the new tramways (approximately one mile in length) between Putney Bridge and Wandsworth High Street. Particulars from the Clerk, and tenders by December 6th, 1910. (See an advertisement on another page.)

Port of London Authority.—Tenders are invited by November 19th for stores, including electric lamps, &c. Particulars from General Manager, 109 Leadenhall Street, E.C.

Manchester.—Arrangements are being made for doubling the track in Fallowfield.

North-Eastern Railway Co.—Tenders are invited for a six or twelve months' supply of stores, including electric lamps, wires, and cables, electric light and fittings, &c. Particulars from Stores Superintendent, Gateshead, and tenders by November 24th.

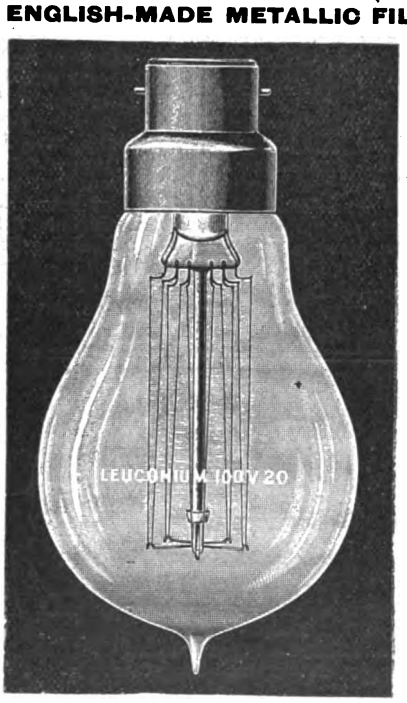
Southampton.—The Electricity Department require 2,000 radiator lamps. Borough Electrical Engineer.

TENDERS RECEIVED AND ACCEPTED

Leeds.—The Tramways Committee recommend the Council to purchase four trolley omnibuses at £700 each.

London: *County Council.*—The London Electrical Engineering Co. have asked to be allowed to withdraw their tender for the electric lighting of Sherington Road school, Greenwich. In consequence, the tender of Messrs. E. Newbold & Co. has been accepted at £256. The Education Committee recommend that the London Electrical Engineering Co. shall not be allowed to tender for any work at the Council's schools for a period of one year.

Sheffield.—The Health Committee recommend the Council to rescind a resolution passed on October 2nd accepting the tender of the Electric Supply Department for certain electric lighting, and to accept the tender of Messrs. T. A. Ashton, Ltd., instead. The tender in question was for electric lighting and electric hoist at the Worthing Road depot, and electric lighting at the Park baths, for a total of £115 17s. 6d., the tender of Messrs. Ashton being 2s. 6d. less.



West Ham.—The tender of Messrs. Hurst, Nelson & Co., Ltd., has been accepted for 12 tramcar bodies and trucks at £488 10s. each, and that of Messrs. Dick, Kerr & Co., Ltd., for electrical equipments at £327 10s. each.

The Mirrlees Watson Co. have received the following orders:—Barometric jet condensing plants for Messrs. Henckell du Buisson & Co., Antigua Sugar Factory; the Natal Estates, Ltd., Mount Edgecombe, Natal; Sociedad Anonima Azucareza Argentina Lacarona Estate; South African Sugar Refinery; J. G. White & Co., Ltd., for Kalgoorlie Electric Light & Power Co.; and C. & W. Walker, Ltd., Donnington. Surface condensing plants for Messrs. Fraser & Chalmers, Ltd., for Erith Electricity Works; the Melbourne Electric Supply Co. Ltd., for Geelong; and the British Thomson-Houston Co., Ltd., for Dublin United Tramways. Low-level jet condensing plants for the Harland Engineering Co., North Blaina Collieries; the British Westinghouse Co., for St. Helens Corporation; and James Howden & Co., for Falkirk Corporation. Steam-driven Edward's air pump for Las Palmas del chaco Austral Sociedad Anonima.

Physical Society's Exhibition.—The date of the annual exhibition, held by the Physical Society of London, which was fixed some time ago for December 13th, has been altered to Tuesday, December 20th. The exhibition will be open in the afternoon as well as in the evening.

APPOINTMENTS AND PERSONAL NOTES

The late Mr. Thomas Hurley, of Messrs. Gent & Hurley, Electrical Engineers and Contractors, of Leicester, left estate of the gross value of £8,533, with net personality of £6,635.

The following re-arrangement has been made in the staff at the York Electricity Works in consequence of Mr. Turnbull, the Works Superintendent, having been appointed Resident Engineer at the Stoke-on-Trent Electricity Works: Mr. Nichols, Mains Superintendent, to be Chief Assistant, at a salary of £150, rising to £175 per annum; Mr. Holmes, Charge Engineer, to be appointed Works Superintendent at a salary of £130, rising to £150 per annum.

The salary of Mr. E. T. Wheeler, collector of accounts in the Hackney Electricity Department, has been increased from £150 to £180 per annum.

In consequence of the resignation of Mr. P. J. Pringle, Electrical Engineer and Tramways Manager at Burton-on-Trent, it has been decided to appoint the Chief Assistant in the two departments to take charge on probation for six months. Mr. Slater will have charge of the Tramways Department, and Mr. Hall the Electricity Works.

Mr. W. Don has retired from the office of chairman of the Dundee Electricity Committee, having been re-appointed a magistrate. He is succeeded by Mr. J. M. Nairn, who also has had considerable experience on the Electricity Committee.

A capable man is required in a small generating station. (See an advertisement on another page.)

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £60 to £60 5s. per ton (last week, £59 to £59 10s.)

Exhibition Awards.—Messrs. Crossley Brothers, Ltd., in addition to their award of a Grand Prix at the Brussels Exhibition, have received a similar honour at the Argentine Republic Industrial Exhibition, Buenos Aires.

Cable Prices.—Messrs. Siemens Bros. & Co. (Caxton House, Westminster), announce that owing to the fall in the market price of rubber, their interim price list of V.I.R. wires and cables, dated October, 1910, will be subject to the following discounts to the trade:—"Association" grade wires and cables and "C.M.A." flexibles, 20 per cent., 15 per cent., and 10 per cent. "Non-Association" class wires and cables, 20 per cent., 25 per cent., and 10 per cent.

Amalgamation.—Messrs. Hooper & Edman, Ltd., Spring Hill Foundry, Birmingham, have taken over the electrical business of the Rippingille Manufacturing Co., and solicit inquiries for water-tight or bulkhead fittings, wall hoists, winches, and other electrical specialities.

Board of Trade Intelligence Department.—A new edition of the handbook to the Commercial Intelligence Branch of the Board of Trade has been issued. It contains full information as to the organisation and objects of this Department of the Board of Trade. No. 73 Basinghall Street, London, where the Intelligence Branch is situated, is intended to be a centre at which information on all subjects of commercial interest shall be collected and focussed in a form convenient for reference, and at which, so far as the interests of the British trade permit, replies shall be given to inquiries by traders of commercial matters. The book is published at the price of 2d.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Western Telegraph Co.—Final dividend at the rate of 6 per cent. per annum, with bonus of 2s. per share.

Cape Electric Tramways.—There is a credit balance of £9,047 for the year to June 30th, all of which has been carried forward.

Cordova Light, Power & Traction Co.—Dividend of 3 per cent. for 1909–10, carrying forward £8,200. The *Financial Times* states that arrangements have been concluded for providing additional capital, which has become necessary owing to the rapid expansion of the company's undertaking.

West India & Panama Telegraph Co.—Dividend of 6s. per share on the first preference shares for June 30th.

Robertson Electric Lamps.—A petition confirming a resolution to reduce the capital from £100,000 to £35,000 will be heard before Mr. Justice Neville on Friday.

Eastern Telegraph Co.—The net profit for the June half-year amounted to £334,590, out of which £175,000 has been added to general reserve, £100,000 to meet two interim dividends of 1½ per cent. on the ordinary stock, and £59,590 carried forward.

Montreal Light, Heat & Power Co.—It is stated that proposals are under consideration for an amalgamation of this Company with the Canadian Light & Power Co. and the Montreal Street Railway Co.

Northern Light & Power Co. (Canada).—A report has been issued by this company, stating that the $1,750,000 new capital recently raised has been applied in the erection of a 8,500 h.p. plant near Dawson City, and the installation of a 44-mile transmission line from the power-station to Dawson.

WIRELESS TELEGRAPHY

THE British Radio-Telegraph & Telephone Co. has installed a wireless telegraph apparatus upon the Liverpool cargo steamer *Drumcraig*, which is the second British cargo boat to carry wireless telegraph apparatus. The previous boat, namely, the *Nonsuch*, was also equipped by the same company, and it is this installation which is to be the subject of an action for patent infringement by the Marconi Co. The *Drumcraig* apparatus takes 1½ kw., and has a normal range of some 400 miles. Besides these installations, the company have fitted two ships of the Spanish-African mail line, which has placed an order with them for four more sets. The Spanish Admiralty are also interested in these equipments.

According to the *Telephone Engineer*, further experiments have been made in New Haven and Toronto with De Forest wireless equipments on express trains. It has been found that, by using a comparatively short antenna wire stretched along the train parallel to the telegraph wires, excellent results are achieved, and it is presumed that the telegraph wires reduce the resistance to the transmission of the waves. Experiments with wireless telephone apparatus are shortly to be made on a line of the New York Central Railway.

Greenwich time is now transmitted twice daily, at midday and at midnight, to ships at sea by means of wireless signals from the German wireless station at Norddeich. A series of special Morse signals are sent out for five minutes before the hour, the last signal being transmitted exactly at 12 o'clock. An automatic transmitter is installed at Norddeich, and this is controlled electrically from the Imperial Observatory at Wilhelmshaven. Similar signals continue to be sent out from the Eiffel Tower, and Messrs. Ducretet & Roger, of Paris, have devised a simple receiving apparatus for use on ships not fitted with wireless installations for the sole purpose of receiving these time signals.

The Marconi Co. are fitting their latest type of wireless telegraph installation upon the Aberdeen Line steamers, *Miltiades*, *Marathon*, and *Moravian*.

SUMMARY

The London Session of the Institution of Electrical Engineers was inaugurated in the new building on Victoria Embankment on Thursday. Mr. S. Z. de Ferranti, the President, delivered an address, in which he described in some detail an ideal scheme for erecting 100 generating stations of 250,000 kw. capacity each, in which all the coal mined in the country would be utilised for producing electrical energy, which would be distributed for every industrial and domestic purpose at an average price of ½d. per unit. The scheme embraces the utilisation of bye-products for the purpose of intensifying the cultivation of land, and making the country independent of outside assistance for its food supply, and Mr. Ferranti considered that it is only a matter of time for the scheme to be carried out in its entirety. (Page 723.)

The new power station of the General Post Office supplies three-phase current at 6,600 volts to substations in the main Post Office buildings in the City, where it is transformed down for lighting and power, and for charging telephone batteries. (Page 724.)

An illustration is given of the lighting of a London Tube Railway Station. (Page 727.)

We publish a detailed description of the new electrical installation at the Institution of Electrical Engineers' building on Victoria Embankment, and illustrations of the principal fittings. The arrangement of the indirect lighting of the Lecture Theatre is fully explained, with a sketch to show the position of the lamps and reflectors. Special silent switches are employed for switching off the Lecture Theatre circuits. (Page 728.)

Works have been erected near London, on the mains of the North Metropolitan Electric Power Supply Co., for manufacturing stone from quarry débris. The method follows natural processes, and a reinforced stone for glazing-bars and floor slabs, as well as a reconstructed marble for switchboard panels, is also made. (Page 730.)

A letter from the Secretary of the Electric Supply Joint Publicity Committee in the *Financial Times* controverts statements in an article in the same paper on the relative activities of the business-getting departments of the gas and electric light companies. (Page 730.)

A paper by Mr. C. F. Smith, read before the Manchester section of the Institution of Electrical Engineers, described a long course of experiments on the irregularities in the rotating field of the polyphase induction motor. (Page 731.)

The Manager of the Bray Corporation Electric Supply Department writes to contradict the statement that the department is not wiring private premises, and gives reasons why they are compelled to do so. (Page 732.)

Mr. T. Harding Churton delivered his inaugural address as Chairman of the Yorkshire Section of the Institution of Electrical Engineers last night. (Page 733.)

Some notes are given on the Leblanc condenser with rotary air pump. (Page 733.)

Mr. M. J. Railling, in his address as chairman of the Birmingham Section of the Institution of Electrical Engineers, dealt with some of the causes of the present state of the electrical industry. (Page 733.)

Mr. S. Z. de Ferranti has patented a gyroscopic stability mechanism for aeroplanes, &c. Among the other specifications published on Thursday was one by A. H. Midgley and C. A. Vandervell for a special train-lighting dynamo. The British Thomson-Houston Co. describe a frequency changer or double-current alternator comprising a single armature with a double

Digitized by Google

winding and a compound field, giving the effect of two field systems of different pole numbers. A patent for a block signalling system with electrically continuous rails is to be amended as the result of an application for revocation. A patent by H. J. Dowsing relating to luminous radiators, and another by Cowper-Coles for the electrolytic manufacture of reflectors expire next week after the full life of fourteen years. (Page 734.)

AN apparatus for estimating the percentage of dissolved matter in water by measuring the electrical conductivity consists of a U-tube with electrodes and a combined hand-generator and meter similar to a "Megger." (Page 735.)

FOUR vehicles have been ordered for the Railless Electric Traction scheme at Leeds. (Page 235.)

THE action by Mr. C. A. Gould against Dr. E. H. Lehwess in respect of the batteries for the London Electrobus Co. came to an end on Friday, when the jury stopped the case at the conclusion of the cross-examination of Dr. Lehwess. On Monday it was stated that Mr. Gould had been settled with. (Page 735.)

A LIBEL action is being heard in the King's Bench Division against Sir John Benn, it being alleged that certain speeches and articles of his have contained libellous statements concerning the G.B. surface-contact system. For the G.B. Co. it was stated that, as put down in the Mile End Road, the system was not the actual G.B. system, but one considerably modified by the officials of the London County Council, in the construction and laying down of which the G.B. Co. were refused any part. (Page 735.)

A REPORT has been prepared by the engineers representing the London Electric Lighting Companies, and Borough Councils owning electricity works, dealing with the linking up of the electricity works in London. (Page 735.)

A POLL of the Acton ratepayers is being taken on the question of whether the electricity undertaking should be transferred to the Metropolitan Electric Supply Co.—The Belfast Electricity Committee have refused to adopt certain rules which the Electrical Trade Union wish to be applied to jointers.—The differences between the Torquay Corporation and the Tramway Co. have now been adjusted.—West Hartlepool Corporation have definitely decided to purchase the local tramway company.—3,459 public lamps have now been converted from gas to electricity in Marylebone. (Page 737.)

ADDITIONAL generating machinery is to be installed at Birkenhead, Londonderry, Manchester, and Llandudno.—Expenditure on mains is contemplated at Hastings, and electric lighting schemes are under consideration by the Ballymoney and Enniskillen Councils.—Specifications are being prepared for a number of wireless telegraph stations in Australia.—The Sydney Corporation require a supply of arc lamp carbons. (Page 738.)

THE British Insulated & Helsby Cables, Ltd., are issuing £200,000 of 5 per cent. mortgage debenture stock. (Page 739.)

A CONFERENCE was held last Thursday between leading representatives of the I.M.E.A. and the E.C.A. with a view to seeing if a settlement could be arrived at of the disagreement of which the Municipal Wiring Bill is the outcome. We publish the names of the five delegates on each side. "Preliminaries" were discussed, and the Conference was adjourned until Dec. 8th. Meantime the E.C.A. are actively canvassing to raise an adequate "fighting fund," and £2,000 has already been guaranteed. (Page 739.)

[*In his Presidential Address to the Institution of Electrical Engineers last week, Mr. Ferranti said*:—"I think it will be possible to acquire knowledge which will enable us largely to control by electrical means the sunshine which reaches us, and, in a climate which usually has ample moisture in the atmosphere, to produce rainfall when and where we require it."]

CLERK OF THE WEATHER: The Crystal Palace? . . . Yes . . . I am very sorry, but you should have notified me of the Association Cup Final before. The Minister of Agriculture requisitioned tropical sunshine for the strawberry fields in North Kent, and you come on the fringe of that area. If it is of any use to you I can switch on a thunderstorm at half time.

INAUGURATION OF THE LONDON SESSION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

Mr. Ferranti's Prophecies.

LAST Thursday the London Session of the Institution of Electrical Engineers opened the new headquarters of the Institution on Victoria Embankment. A large number of prominent members were present, the Council attended in force, and the new lecture hall, which seats over 400, was crowded to its utmost capacity. The outgoing President, Prof. Gisbert Kapp, welcomed the members to their new home, and then called upon Mr. Crompton to make a statement as to the work done at the unofficial meeting at Brussels of the International Electrotechnical Commission (reported in ELECTRICAL ENGINEERING of August 18th, 1910, p. 534). The premiums won last session (a list of which appeared in ELECTRICAL ENGINEERING of June 2nd, 1910, p. 353), were then presented by Prof. Kapp, and before he vacated the chair in favour of the new President, Mr. S. Z. de Ferranti, a cordial vote of thanks to him was proposed by Mr. Crompton, seconded by Mr. Mordey and carried with acclamation.

Mr. Ferranti then proceeded to give his Presidential address—an address of startling originality in itself, and rendered still more interesting by the fact that Mr. Ferranti spoke and did not read—and, in fact, hardly referred to his notes during the entire speech of about three-quarters of an hour's duration.

He commenced by pointing to the present wasteful methods of converting the energy of coal into useful work, which, taking all the uses of coal into consideration, involved a loss estimated at 90 per cent. In addition, we dissipate nearly the whole of the valuable bye-products, consisting principally of fixed nitrogen, which could be employed to increase the return of foodstuffs from the comparatively small acreage of land under cultivation, and Mr. Ferranti also referred incidentally to the ever-increasing exportation of coal to other countries which tended further towards the exhaustion of our coal supplies. He next pointed to the large expenditure of labour in raising, distributing, and burning coal, and also in clearing up the dirt produced by our present methods of using coal, and then outlined the ideal method of employing the coal resources of the country. This is to concentrate the whole transformation of coal into energy at a comparatively small number of great electricity-producing stations and to distribute electrical energy from them to supply the entire light, heat, power, and chemical energy required for the industrial and domestic needs of the country.

In order to supply electricity for all purposes in this manner, Mr. Ferranti estimates that it would be necessary, among other things, to have a conversion efficiency of not less than 25 per cent. Assuming this conversion efficiency, instead of the 10 per cent. already mentioned, the annual consumption of coal would be reduced from 150 million tons (a figure based on the Report of the Royal Commission on Coal) to 60 million tons. This would represent 131,400 million Board of Trade units of electricity. The only existing engine which is theoretically capable of returning 25 per cent. of the energy in the coal in the form of electricity is a gas-driven alternator, but the units are too small and the cost of the complete installation too high; the gas turbine is not yet available, nor is a method of generating electricity direct from coal. Mr. Ferranti favours an intermediate process, which will, he believes, give the necessary efficiency without undue complication or expense. "The steam-gas turbine," he said, "in which steam is used in the state of gas at a high temperature throughout the process of conversion into work, gives theoretically a high efficiency at workable temperatures, and I believe will, in course of time, supply the necessary means of conversion for effectively turning our coal into electricity."

The next consideration was that of capital cost, and to estimate this an assumption of a load factor is necessary. By employing heat storage in domestic heating, and adapting and modifying metallurgical processes so that they can take current intermittently and so fill up the load curve, Mr. Ferranti believes that a load factor of 60 per cent. would be obtained. To supply 131,400 million units annually at this load factor, 25 million kw. of plant would have to be installed. This would be supplied by 100 stations, each equipped with ten 25,000-kw. generators. Taking the cost of these at £7 per kw. and the cost of the distributing system at £13 per kw., a total expenditure of 500 millions sterling would be required for the scheme—only 100 millions greater than the 400 millions capital now estimated to be invested in electrical undertakings, of which 58 millions are invested in the electricity supply business. The units generated, however, would be 150 times as many as at present. The capital charges at 8½ per cent. work out to 0·0776d. per unit, and Mr. Ferranti takes the works costs at 0·036d., bringing the total costs, including capital charges, to 0·1145d., or 62 millions sterling per annum. In arriving at the works cost, the assumption has been made that the coal costs 10s. per ton, but the costs are credited with fixed nitrogen bye-products for agricultural purposes to the value of 8s. per ton of coal.

On this basis, representing an average selling price of ½d. per unit of electrical energy, electricity could be used with economy not only for lighting, heating, and traction, but even, Mr. Ferranti contends, for such purposes as the manufacture of pig iron, and, in fact, for every possible case in which coal, gas, or power are now employed.

The utilisation of the bye-products for the fertilisation of land and for the purpose of intensive culture was next considered, and it was estimated that it would be possible to provide in our own country all the grain which we should require for food, and also all the foodstuffs we should require for the raising of cattle. The other bye-products, tar and light oils, could be employed for road-making and motor-cars respectively—the latter when carburettors have been further developed. If the three million tons of sulphate of ammonia, the total amount of the bye-product, were not sufficient in itself for agricultural purposes, further supplies of fertiliser could be made economically at the low cost of generation by the oxidisation of atmospheric nitrogen, and this would also afford a means of improving still further the load factor. If this latter manufacture were carried on at such times as to fill up completely the gaps in the load curve, Mr. Ferranti concludes that, crediting the value of the additional sulphate of ammonia produced as a bye-product from the extra coal consumed, the cost of the corresponding 43,800 million additional units generated would only be $\frac{1}{10}$d. per unit.

This part of the address relating to the further generation of units at $\frac{1}{10}$d. was included in the printed Paper handed to the Press which will be published in the Institution *Journal*, but was not dealt with by Mr. Ferranti in his speech, nor was the suggestion that it should be possible to acquire knowledge which will enable us largely to control by electrical means the sunshine which reaches us, and, in a climate

Digitized by Google

which usually has ample moisture in the atmosphere, to produce rainfall when and where we require it.

"It seems to me that it may be possible, when we know a great deal more about electricity than we do to-day, to set up an electrical defence along our coasts by which we could cause the moisture in the clouds to fall in the form of rain, and so prevent these clouds drifting over the country between ourselves and the sun which they now blot out. It also seems to me that it will be possible, when more water on the country is required, to cause the falling of rain from the clouds passing over the highest part of the country and so produce an abundance of water which, properly used, would greatly add to the fertility of the country."

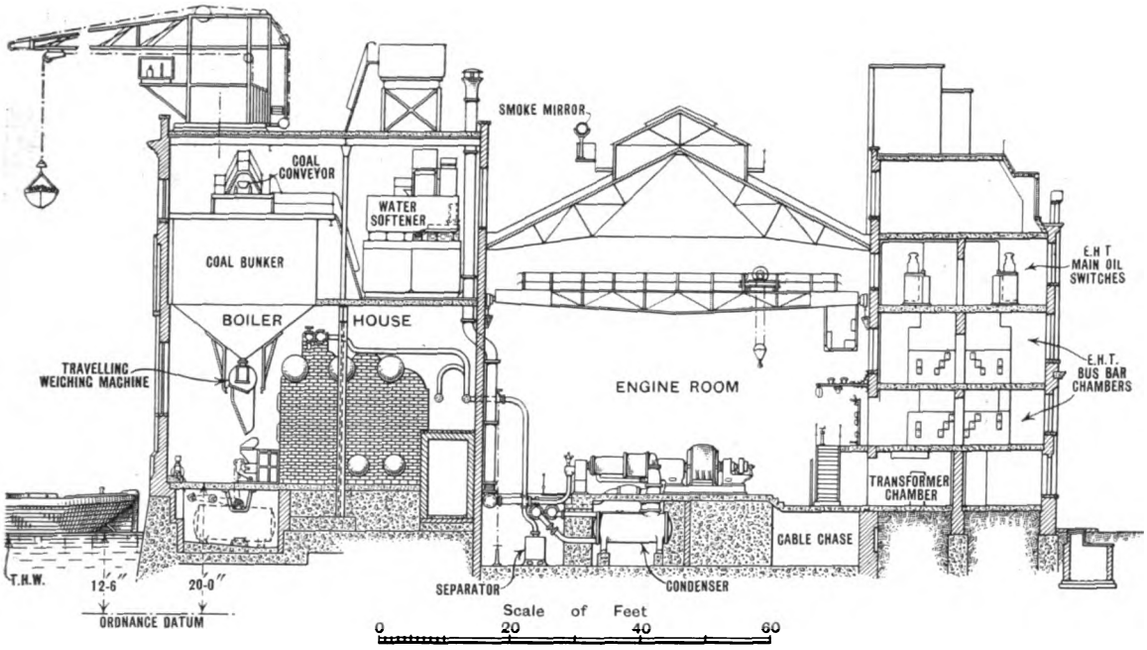
In bringing his address to a conclusion, Mr. Ferranti said:

It may seem that these are only mad visions of the future, but I think we can hardly consider these results more improbable than anyone would have considered wireless telegraphy or flight in heavier-than-air machines fifty years ago. Of course there are many things which at present stand in the way of realising such a scheme as I have outlined. There are many technical details which nothing but an immense amount of work can solve satisfactorily. There are also political and legislative difficulties standing in the way, but these, when the time arrived, would have to be got rid of rather than allow them to handicap the advance of the country. The more, however, that I have considered these ideas in detail, the more certain am I of the fundamental soundness underlying them, and that it is only a matter of time before such a scheme is carried out in its entirety.

The applause which greeted the address was enthusiastic, and it was renewed after the formal vote of thanks had been proposed by Mr. R. K. Gray, and seconded by Dr. Glazebrook. A reception by the President and Council was then held in the Common Room, and members were also invited to inspect the building. As to its suitability for the Institution, there can be no two opinions. The imposing Entrance Hall, the fine Lecture Theatre, and, in fact, every one of the rooms combines tasteful elegance and intense practicability. There is seating accommodation for about 420 in the Lecture Theatre, about 30 per cent. more than in the Institution of Civil Engineers' theatre, which has hitherto been kindly lent to the Electrical Engineers for their meetings, and the acoustic properties are excellent; every speaker was heard at the back of the hall with absolute distinctness. The equipment of the Lecture Theatre is particularly praiseworthy. Frames for diagrams are arranged so that they can be raised or lowered by means of a winch; Lewis bolts are provided in the wall behind the lecture table, and there are holes in the ceiling for fixing or suspending machinery and apparatus; water and gas supply for experimental purposes is laid on under a floor trap in front of the table; the screen for the lantern can be raised or lowered from the lantern room; and the electrical arrangements, which are dealt with in another article in this issue, are all that can be desired.

An excellent idea is the "Common Room," which is intended as a "rendez-vous" for members, and in which smoking is permitted. In addition to the large Council Chamber, there are two smaller Committee Rooms, which will be lent to members for private meetings, and provincial members desiring the use of a room for interviewing candidates for appointments or similar purposes, may also have the use of one. The library is large, well arranged, and excellently lighted and ventilated, and the roomy offices give intense satisfaction to Mr. Rowell, the secretary, and his staff.

An article describing the electrical installation will be found on page 728.



NEW POWER STATION OF THE GENERAL POST OFFICE

UP to the present, the lighting and power supply for the main Post Office buildings in London has been obtained from small generating stations situated in the basement of these buildings, while the extensive pneumatic service has been supplied from pumps steam-driven by beam engines, the first of which was installed in 1871. In order to meet the growing demand for power, an entirely new system has been designed, and is now completed. This includes a large generating station on the south side of the river near Blackfriars Bridge, which, at present, feeds three sub-stations situated in the basements at the new King Edward building, G.P.O. West and Carter Lane respectively. The load includes lighting, charging of telephone batteries, motors for various machines, fans, lifts, and conveyers, and electrically-driven air-pumps which will replace the beam-engine sets.

The power station has at present a normal full load capacity of 2,500 kw., and generates alternating-current at 6,600-volts, 50-cycle, three-phase, which is transformed down at the sub-stations to 110 volts for lighting and 440 volts A.C. and 220 volts D.C. for power. A plan and section of the station is given in Fig. 1. Coal is lifted out of the barges by an electric crane and grab on the roof, and delivered through an automatic weighing machine into an endless bucket conveyer, and distributed in the seven 100-ton sections of the overhead coal bunkers. The coal is fed to the stokers through travelling weighing machines, of which there are two, driven by small motors and supplied with current from trolley wires running along the entire boiler frontage. The conveyer returns along under the boiler-house floor to deal with the ashes in the usual way. Seven Stirling water-tube boilers are installed, and deliver steam at 200 lbs. per sq. in. pressure, superheated to 550° Fahr. They are fitted with Babcock & Wilcox chain-grate stokers, driven through chains and a shaft in the basement by an electric motor, or, alternatively, by a small steam engine. The mirror on the roof enables the switchboard attendant to detect any emission of black smoke. The feed-pump equipment includes an electrically-driven centrifugal pump, which will normally be used, a duplex steam pump, and an injector. Each is capable of delivering 3,000 gallons per hour against a pressure of 200 lbs. per sq. in. The feed water can either be passed through the Clay Cross economiser or direct to the boilers. Make-up water is drawn from the town supply, and is treated in a softening plant before use. Lea recorders are provided for measuring the condensed steam and the make-up water. The arrangement of the steam pipes can be seen from Fig. 1. The range is so sectionalised that any turbine or the small auxiliary set can be supplied from any boiler.

The main generating sets, a view of which is given in Fig. 2 consist of two 1,000-kw. and one 500-kw. standard Willans-Parsons turbines, coupled to Dick, Kerr 6,600-volt three-phase alternators running at 1,500 r.p.m. and 3,000 r.p.m. respectively. Each set has an overload capacity of 50 per cent. for two hours, and the steam consumption at full load is given as 17 lbs. per kw.-hr. with 27 in. vacuum. The radial clearance of the turbine blades measured cold varies between 22 mils at the H.P. end to 40 mils at the L.P. end between cylinder and moving blades, and from 32 mils to 50 mils between rotor and fixed blades. The axial clearance between moving and fixed blades is $\frac{1}{8}$ to $\frac{3}{16}$ in. Fig. 3 shows one of the turbines opened up. Bye-pass valves, through which high-pressure steam can be supplied to the intermediate sections in order to deal with heavy overloads, are provided. The surface-condensers for the 1,000-kw. turbines have each a total cooling surface of 2,200 sq. ft., and are fitted with vacuum augmenters.

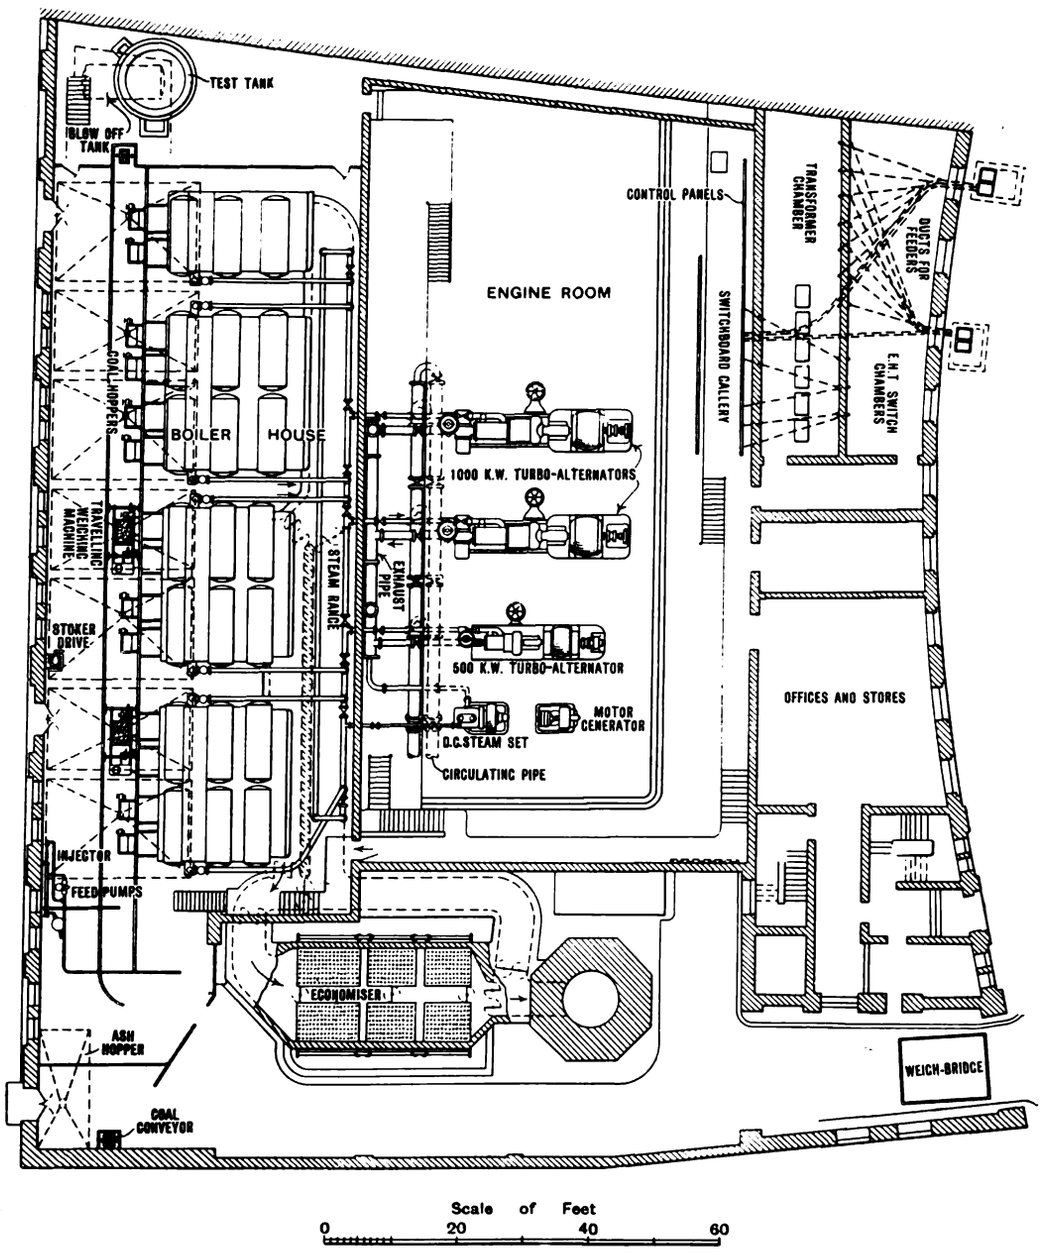

FIG. 1.—SECTION AND PLAN OF G.P.O. POWER STATION.

Digitized by Google

For the circulating water, three 24 in. pipes have been laid in the river bed, and connected at a point 200 ft. out to a concrete apron containing pits protected by a grating. One pipe will be used for discharge, and one of the remaining two for suction, according to which is on the cool water side of the discharge, *i.e.*, according to the direction of the tide. Besides the usual strainers in the catch-pits, two electrically-driven mechanical strainers are installed. One of these is the well-known rotary Bailey-Jackson strainer. The other is of the Willans-Roberts type, consisting of three reciprocating plungers fitted with straining grids, and operated from a shaft with cranks set at 120°. At one end of the stroke of each plunger the corresponding grid is inserted in the suction, and at the other end it is inserted in the discharge. This strainer is on the river side of the pumps, and, therefore, protects them. Electrically-driven pumps of the Rees Roturbo vertical centrifugal pattern are employed, two having a capacity of 3,000 gallons per minute. For priming purposes and for ridding the pipes of air there are provided two steam-ejectors and an electrically-driven air-pump.

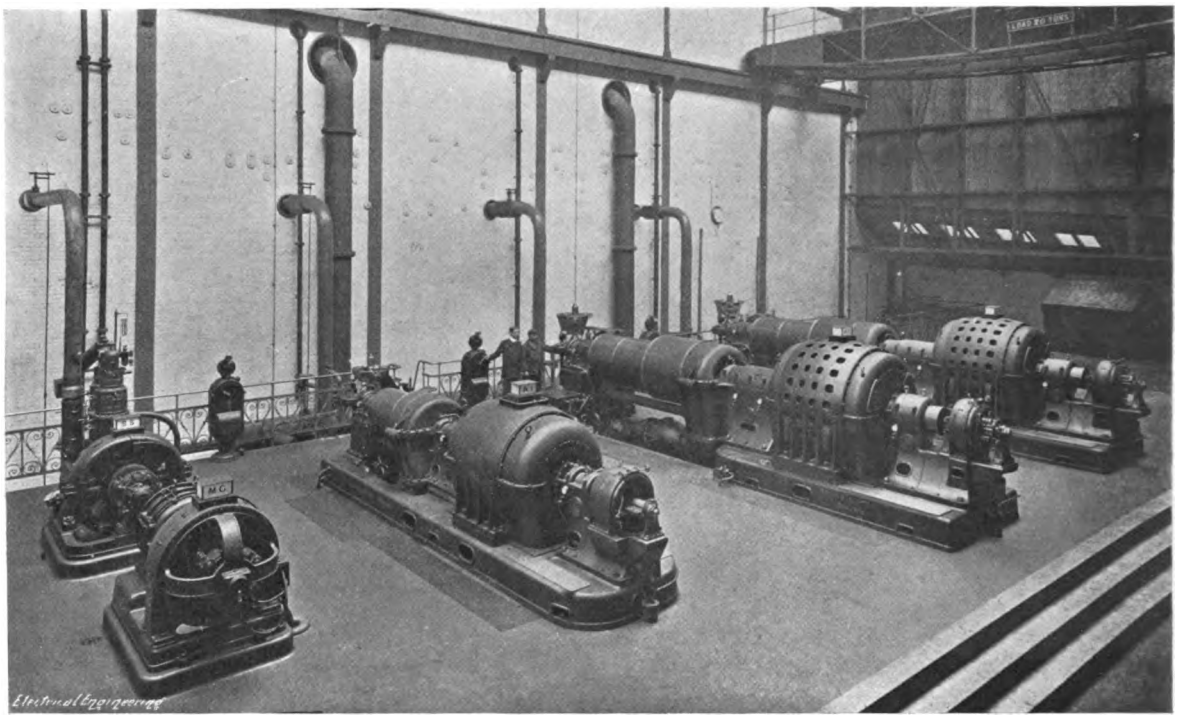

FIG. 2.—INTERIOR OF ENGINE ROOM OF G.P.O. GENERATING STATION.

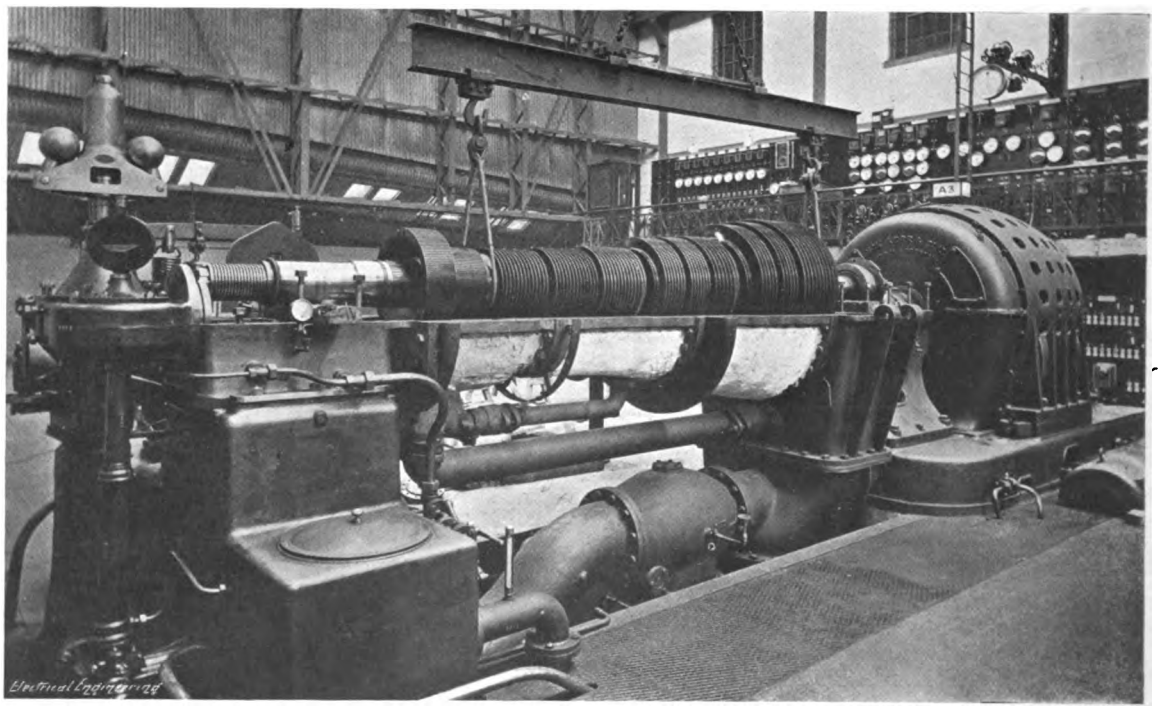

FIG. 3.—1,000 KW. WILLANS-PARSONS TURBINE WITH DICK, KERR ALTERNATOR.

In order to avoid any troubles arising out of the presence of triple-frequency currents, a switch is provided so that the neutral points of the star windings of the alternators can each be separately connected to earth. A resistance limits the current, in the event of an earth on the system, to the amount necessary to operate the overload relay on the feeder in question.

Digitized by Google

The machines can thus be run in parallel with only one neutral earthed, but it is proposed to work the system normally with an unearthed neutral.

The auxiliary plant consists of two sets of three transformers with a capacity of 100 kw. per set, supplying current at 110 volts for power and lighting in the station; a 35-kw. 110-volt steam D.C. generating set for battery charging or lighting; an E.P.S. battery of 60 cells with a capacity of 700 ampere-hours on the one-hour rating, and, lastly, a 35-kw. B.T.-H. motor-generator, which forms a reversible link between the A.C. and D.C. 'bus-bars. The motors in the station include two 50-h.p. motors and one 25-h.p. motor for the circulating pumps, a 30-h.p. hoisting motor for the coaling crane, and twenty-four smaller motors for various purposes. The engine-room is lit by six flame arc lamps, and 124 incandescent lamps are employed. Paper-insulated lead-covered cable is used for power and lighting, run on wood cleats and protected by sheet-iron casing.

A water-resistance for loading the generators for testing purposes is provided. This consists of a vertical concrete barrel of 9 ft. diameter by 8 ft. deep, and contains three electrodes, which can be raised or lowered from outside the tank. By mixing river and town water and regulating the flow, a wide range of load can be obtained.

The arrangement of the switchgear, which was supplied by the British Westinghouse Electric & Manufacturing Co., is indicated in the elevation of Fig. 1. The high-tension gear is contained in cells of artificial stone, and is operated on the electrical remote control system, with signal lamps. The main 'bus-bars are in duplicate, and earthing switches are provided for use when cleaning either set. All connections from the control-board to the instrument transformers, operating solenoids, trip coils, &c., are run in steel conduit.

Current was first supplied from this station last August, and, since then, the load has been gradually transferred from the old stations. We had the pleasure of inspecting the station on Thursday last, when we also visited the sub-stations and the new King Edward building. A description of these and the distribution system will be given in our next issue. In conclusion, we would wish to express our thanks to Major W. A. J. O'Meara, Engineer-in-Chief to the Post Office, for permission to inspect and describe the station, and to Mr. H. C. Gunton, Engineer to the Power Department, for the loan of photographs and drawings, and permission to use information contained in a Paper read by him on Monday last before the Institution of Post Office Electrical Engineers in London.

The Andrew Carnegie Research Scholarship.—A Research Scholarship or Scholarships, of such value as may appear expedient to the Council of the Iron and Steel Institute from time to time, founded by Mr. Andrew Carnegie (Past-President), who has presented to the Iron and Steel Institute eighty-nine one-thousand dollar 5 per cent. debenture bonds for the purpose, will be awarded annually, irrespective of sex or nationality, on the recommendation of the Council of the Institute. Candidates, who must be under thirty-five years of age, must apply on a special form before the end of February to the Secretary of the Institute. The object of this scheme of Scholarships is not to facilitate ordinary collegiate studies, but to enable students, who have passed through a college curriculum, or have been trained in industrial establishments, to conduct researches in the metallurgy of iron and steel and allied subjects, with the view of aiding its advance or its application to industry. There is no restriction as to the place of research which may be selected, whether university, technical school, or works, provided it be properly equipped for the prosecution of metallurgical investigations. The appointment to a Scholarship shall be for one year, but the Council may at their discretion renew the Scholarship for a further period, instead of proceeding to a new election. The results of the research shall be communicated to the Iron and Steel Institute in the form of a Paper to be submitted to the Annual General Meeting of members, and if the Council consider the Paper to be of sufficient merit, the Andrew Carnegie Gold Medal shall be awarded to its author. Should the Paper in any year not be of sufficient merit, the medal will not be awarded in that year.

RAILWAY LIGHTING

BOTH the well-known Tantalum and One-watt lamps of Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston), have been adopted to a considerable extent in cases such as for railway work, where the toughness of their wire-drawn filaments offers particular advantages. The accompanying illustration shows a combined installation of these two types of lamp at a London tube railway station. A number of 100-c.p. lamps with suitable opal reflectors are fixed at regular intervals so that the light is directed upon the platform, whilst Tantalum lamps are installed in

TANTALUM AND ONE-WATT LAMPS AT A LONDON TUBE STATION.

weatherproof brackets on the wall, centrally, between them. Tantalum lamps have been also running successfully on the trains for some years, and some of them are reported to have given a life of over 6,000 hours. Tantalum lamps are still rapidly gaining ground for traction work, and at the present time three further tramway companies have decided in favour of installing them on their cars. The use of One-watt lamps is also extending rapidly, and several electric supply companies have arranged street lighting maintenance contracts with them.

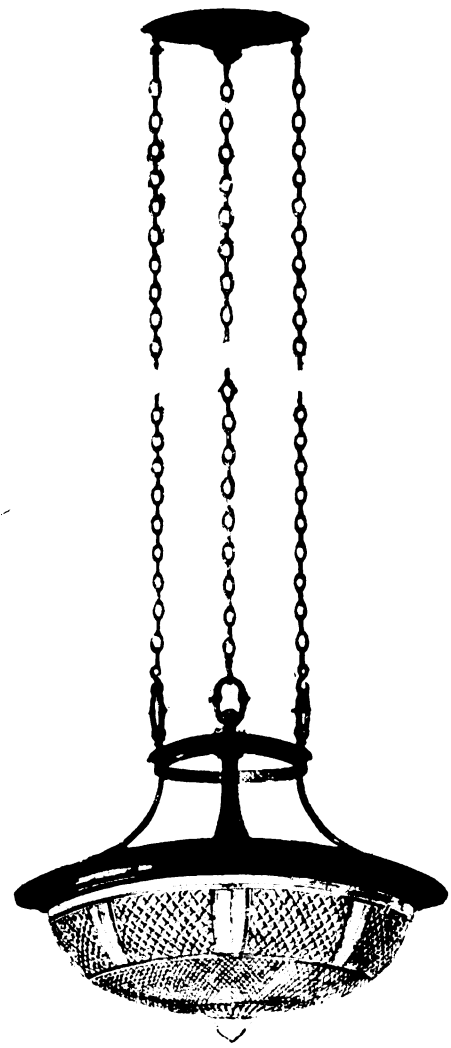
CATALOGUES AND PAMPHLETS, &c., RECEIVED

GAS AND OIL ENGINES.—A leaflet from Messrs. Fielding and Platt, Ltd. (73a Queen Victoria Street) gives some illustrations and particulars of their suction gas plants, which are made in sizes from 9 to 300 B.H.P.

FLAME ARC LAMPS.—A card from the A.E.G. Electric Co., Ltd. (Pembroke House, 133-135 Oxford Street), illustrates the latest form of A.E.G. flame arc lamp for long burning with low cost of carbons.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

OSRAM LAMPS.—The latest form in which the well-known Osram Lamp poster of the General Electric Co., Ltd. (67 Queen Victoria Street), has made its appearance is as a transparency about 12×10 in., which can be easily affixed to windows, etc., and when in position makes a very effective advertisement. The Company have also repeated this design on the cover of their new leaflet of prices and sizes of Osram Lamps, and this is so arranged that the name and address of any agent can be printed on it. All the ordinary sizes from 25 volts 10 c.p. to 200 volts 1,000 c.p. are included.



VACUUM CLEANERS.—A self-contained vacuum cleaner for domestic purposes, with electrically driven pump of a size that can be run from an ordinary lighting circuit, is described in a series of pamphlets from the Duntley Manufacturing Co. (Maconochie's Wharf, Millwall). In addition to being used in the ordinary way, the apparatus can be converted into a blower by fixing the hose to another nozzle, and used for blowing dust from articles which could not be cleaned by suction. Various massage vibrators and other toilet appliances can also be worked by its means.

METAL FILAMENT LAMPS.—A very effective card, embellished with a portrait of a Mephistophelian gentleman introducing a ring of lamps, is to hand from Fabius Henrion (Nancy), and calls attention to their "Osmine" lamp.

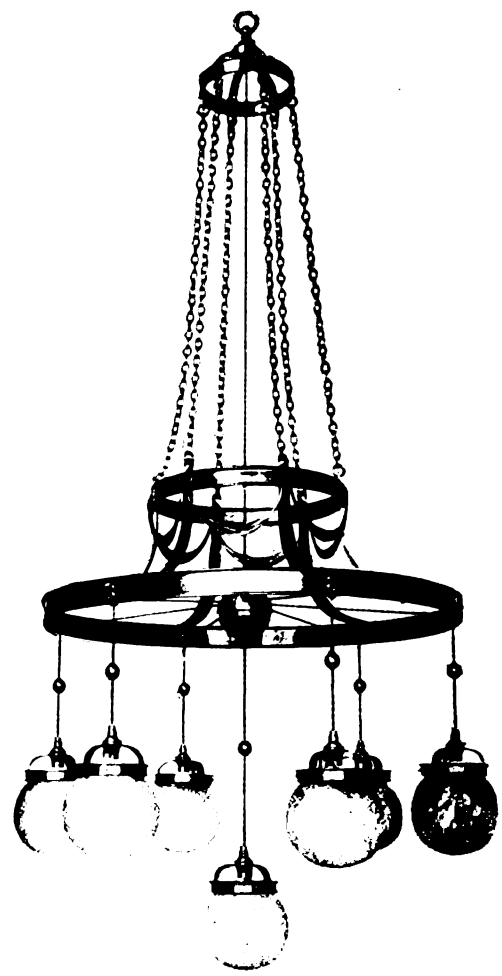
THE ELECTRICAL INSTALLATION AT THE NEW BUILDING OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE electrical installations at the Institution of Electrical Engineers building on Victoria Embankment presents several points of unusual interest. As is well-known, the building is not actually a new one (having been purchased from the Royal Colleges of Physicians and Surgeons), but it has undergone so much transformation that the convenient name "new building" is hardly a misnomer. At the time it was taken over, the building was electrically lighted, but the work must have been carried out about 20 years ago, so that, as extensive alterations in the arrangements of the electric lighting were required, re-wiring



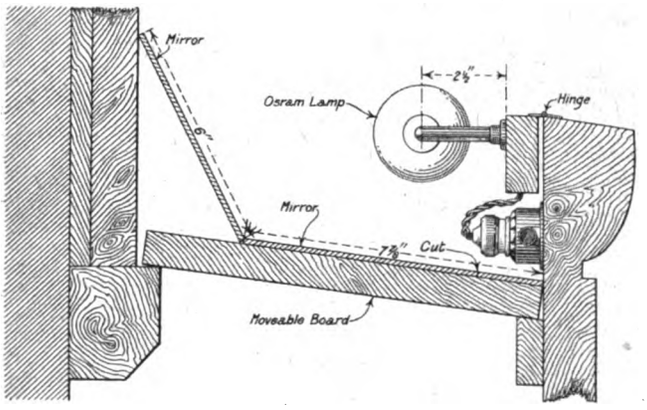
OSLER CUT GLASS DISH FITTING IN ENTRANCE HALL.
(One-Twelfth Full Size.)

was necessary. It was found, however, that the circuits to the parts of the building which the Colleges still occupy as tenants could remain as they were, and the Institution, as well as their tenants, continue to be supplied with current at 100 volts from the private plant of the adjacent Savoy Hotel as heretofore.

The Building Committee entrusted the specification and supervision of the work to Messrs. Handcock & Dykes, and tenders were advertised for. The tender of Messrs. Drake & Gorham, Ltd. (66 Victoria Street, Westminster), was accepted, and the installation has been carried out by this firm in a thoroughly workmanlike manner, as their reputation would naturally lead one to expect.

In order to select fittings, the Building Committee invited several firms to submit suitable designs, and two classes of fitting, by Messrs. Osler, Ltd. (100 Oxford Street, W.), and the Birmingham Guild, Ltd. (45 Gt. Charles Street, Birmingham), were selected. We illustrate the fitting supplied by Messrs. Osler for the Entrance Hall. This is a fine cut-glass dish about 2 ft. in diameter, with a suspension departing somewhat from the usual design, and is a fine example of the beautiful work always associated with the name of this firm. The glass is prismatically cut in such a way as to diffuse the light to the best advantage. It contains 10 lamps. In the library, fittings of a somewhat similar design, but with dishes of about 18 in. diameter, suspended more directly from chains, are employed, and Osler cut-glass fittings of a conical shape are used in the corridors and on the staircases. Our second illustration is the fitting made by the Birmingham Guild, Ltd., for the Council Room; it has an

SEVEN-LIGHT ELECTROLIER IN THE COUNCIL ROOM.
(Birmingham Guild, Ltd.)



effective appearance, and smaller fittings and three-light fittings on precisely similar lines in the Committee Room and Common Room, although less imposing, are still more pleasing. In these fittings the flex—although of substantial size (70/40 C.M.A.)—is not relied upon to bear the weight of the lamp and globe in each case, but three fine steel wires are added for the purpose. This precaution— in our opinion unnecessary—certainly detracts from the appearance of the fitting when viewed at close quarters; we understand that it was added at the suggestion of the Committee, and

Digitized by Google

certainly does not form a feature of the fitting as originally designed by the manufacturers.

Osram lamps are employed throughout.

Returning to the actual wiring. this has been carried out with Siemens C.M.A. 2,500-megohm cable, run in heavy solid-drawn enamelled steel conduit for the power circuits and main cables (except in those cases where the existing 19/12 jute-insulated lead-covered cable has been utilised), and in "Kalkos" conduit for the sub-circuits. The latter system has lent itself admirably to the concealed work, and was adopted by the contractors, who were given the option of employing this or steel barrel. The use of draw-in boxes has been

SKETCH SHOWING ARRANGEMENT OF LAMPS AND MIRRORS FOR REFLECTED LIGHTING IN THE LECTURE HALL.

avoided, and the drawing-in of the wire has been done from the switch and point boxes. These boxes, with their adjustable rings, forming, as it were, a false bottom for the base of the switch, have facilitated the adjustment of the cover-plates of the switches flush with the surface of the walls, and, although the cover-plates themselves might with advantage have been of a more elegant pattern and finish, the whole is a sound and admirable piece of work. In the case of the switches and switch-runs in the marble-faced walls, the tubing is run between the brick wall and the marble slabs, and the latter were bored accurately to take the switch-boxes so that the cover-plate over the switch entirely hides the hole, and no making-good round it was required.

The distribution boards are in iron cases, and on the main distributing boards a useful carrier type of fuse is employed, in which the fuse wire is run through an asbestos-lined black fibre sleeve with wide flanges. In the projector lantern circuits, a low resistance is placed in circuit at the distributing board in the basement in each case (a one-ohm resistance capable of carrying 50 amperes, and a 2½-ohm resistance for 25 amperes, respectively), to prevent any evil effects from short circuits. A special heating circuit is run to a room in the basement allotted to the boiling of tea and coffee. This terminates in a six-way D.P. distribution board containing switches for each circuit, and there is a red pilot lamp above each way which glows when the circuit is on. Six plug points are fed from this board, and General Electric Co. boilers are employed, each with 1 kw. for the first heat and 350 watts after. One of the boilers is adjustable, further, to 200 watts.

A room in the basement has been allotted for a special motor-generator (not yet erected), which will supply current for experimental purposes in the Lecture Theatre when the 100-volt supply is not suitable for demonstration purposes. A fuse-board with six 50-ampere ways has been fitted in this room, and is connected to a similar board in the Lecture Theatre. In the Common Room there are also three pairs of 25-ampere terminals controlled by two-way switches, but these are connected to the 100-volt supply only. A special terminal is employed on these boards in the Motor-generator Room, the Common Room, and Lecture Theatre, which enables any size of cable to be connected up rapidly. To facilitate the demonstrations in the Lecture Theatre, a telephone line connects this to the Motor-generator Room. From the terminal board in the Lecture Room, which is on the wall behind the Council table, a 3 in. earthenware tube is led under the floor to the space in front of the table so that the wires may be conveniently connected to the apparatus without being trailed across the floor.

The lighting of the Lecture Theatre is "indirect." Around the cornice 220 30-watt Osram lamps are fixed above corrugated mirrors in the manner sketched opposite, and their light is reflected upwards on to the curved portion of the cornice or frieze, which reflects it downwards and diffuses it. The battens upon which the lamps are fixed are each 10 ft. long, and are on hinges, so that the batten may be turned back for lamp renewals, cleaning, &c. Each batten has eleven lamps fixed on it in a horizontal position, and wired with "Stannos" cable, and the lamps are divided into ten groups (two battens each), connected to plugs. The relative position of the plugs and lamps is indicated in the sketch. The plugs are connected on two circuits, and are wired alternately so that the lighting remains symmetrical if one circuit is off. This reflected lighting is supplemented by the light of four 4-ampere Westinghouse Silica lamps suspended about 6 ft. 6 ins. above the "lay-light" or glass ceiling in the centre of the theatre. The combined effect of the blue light from these lamps and the reflected light gives a soft illumination of a similar colour to daylight, and to all intents and purposes as well diffused, and the illumination is sufficient to enable small print to be read with ease. The light, however, is a cheerless one, probably because it resembles daylight too closely in character, while the illumination must necessarily be less than that of daylight. We recommend the addition of a large electrolier in the centre of the hall itself. A use of the Silica lights that must be mentioned is that, owing to the difference in colour, they do not affect the lantern, and in consequence they can be left on when pictures are shown, so that members can refer to their papers and take notes, although the other lamps are extinguished.

A small Lantern Room is built in the wall of the Lecture Theatre, facing the lecture table. In the room are three switches controlling the two circuits of the cornice lights, and the Silica lamps in the roof. These are two-way, as the circuits are wired so that they can be switched off from the floor of the Lecture Theatre or from the Lantern Room. It was deemed necessary that they should work with absolute silence, and they have been specially designed for this purpose. They are of the quick break laminated pattern, in which an auxiliary contact arm takes the spark, and this flies back against a rubber buffer, which separates the main from the auxiliary contact arm. Terminals and an ammeter are provided for the lantern, and a fireproof flexible cable is employed for the connection. The Lantern Room is fireproof; the wall to the Lecture Theatre is lined with uralite, and the opposite wall and side walls are the solid brick walls of the theatre.

The rooms are provided with 15 "Magneta" clocks, which were presented by the Magneta Time Co., Ltd. (Chatham House Works, Turnham Green). The master clock is in the Committee Room. The circuits of these, as well as of the bells and internal telephones, are wired with "Stannos" wire, using the outer sheathing as a return.

Our thanks are due to Messrs. Handcock & Dykes, and Drake & Gorham (and Mr. C. Smith and Mr. P. H. Wigg respectively of their staffs) for giving us particulars for this article, and to Mr. P. F. Rowell, the Secretary of the Institution, for permitting us to make a minute inspection of the installation in the building.

MANUFACTURE OF STONE FROM QUARRY DEBRIS

WE recently had the opportunity of visiting the works at Ponders End, Middlesex, of the British Stone & Marble Co., Ltd., in which the manufacture of reconstructed stone from quarry débris by the Thom process is being carried on. The works are large, and cover an area of some three to four acres; electric power is employed exclusively.

The process consists of a series of mechanical and chemical operations, following closely the natural process of the formation of sedimentary rocks. The chemical composition, physical texture, and characteristic features of the natural stone are accurately reproduced, while the defects of bedding-planes and non-uniformity are eliminated. The density is greater than that of the natural product, and tests have shown that the reconstructed stone is actually superior in strength, hardness, and durability. Débris or waste chippings of any suitable building stone are brought straight from the quarries to the works, where they are disintegrated in a special machine which preserves the form of the orginal component egg-shaped grains of the Oolitic stone, but separates them from the carbonate matrix. The resulting grit is mixed with about 10 per cent. of lime made from dolomite calcined in closed retorts, and the mixture thoroughly slaked. Water is added until the consistence is that of cream, and the mixture is then poured into steel moulds and put under hydraulic pressure to remove the water and consolidate the mass. On leaving the moulds, the blocks are of the consistence of soft chalk, but are perfectly uniform throughout. After being exposed to the action of the atmosphere for a week or so, they can be sawn, shaped, and carved with ease, the carving by skilled men taking only about one-third the time necessary when working on hard stone. The finished blocks are dried at a temperature of 100° to 120° Fahr., and then placed in closed steel tanks. The air is exhausted, and the carbonic acid gas extracted from the dolomite in the production of the lime is admitted under a pressure of 100 lbs. per sq. in. This gas permeates the blocks, and the whole of the hydrate of lime holding the stone particles together is chemically converted into the carbonate, thus actually reconstructing the original natural stone. Any kind of sedimentary rock can be reconstructed in this way, but Oolitic limestones, such as the Bath, Portland, and Ketton stones, are the most suitable. A very durable stone for paving and building purposes and having the appearance of Kentish Rag, is made with crushed blast-furnace slag as the basis.

Power is supplied to the works at 10,000 volts, three-phase, 50 cycles, from a ring main of the North Metropolitan Electric Power Supply Co., who have erected a transformer sub-station in the works. This contains two 100-kw. three-phase transformers, which transform down from the supply pressure to 415 volts, three-phase, four-wire, for distribution in the works. The lighting is at 240 volts between any one phase and the neutral.

Taking the plant in the order of the process, the stone débris is first broken into pieces of the size of the fist in a rotary stone-crusher, and it is then passed into a Carter's disintegrator, in which it is reduced to grit. From this it is raised by a vertical bucket-conveyer to hoppers above. After sifting, it is carried to further hoppers over rotary mixing machines, each stone hopper having a lime hopper adjacent to it. The two materials fall into automatic weighers, and quantities are dropped into the mixers in the ratio of 8 to 10 parts of stone to one of lime. After mixing dry, a small quantity of water is added to effect the slaking. The product is then transferred in the form of a damp powder to storage hoppers, where it is left for two or more days. There are two large mixing and slaking machines at work, and two more are now being installed. The crusher, disintegrator, and slakers are all belt-driven from shafting driven by two 75-h.p. motors. These two motors are controlled by a single oil switch with overload release, and in order that they may be stopped instantly in cases of emergency, provision is made for tripping the switch from push-button switches placed adjacent to the machines. To ensure that these local circuits are in working order, the machines are shut down by this means two or three times a week.

There are four hydraulic presses: a 1,800-ton press giving 4 tons per sq. in. and taking blocks of $9' \times 2' \times 2'$; a 2,000-ton press, giving 2 tons per sq. in., and taking blocks $4' \times 2'\ 6'' \times 9''$; a 1,000-ton press giving 4 tons per sq. in. and taking blocks $3' \times 3' \times 3'$; and a 540-ton experimental press. All four presses are supplied from a large 80-ton hydraulic accumulator, which is fed by means of a 60-h.p. three-throw pump, controlled automatically by electrical gear supplied by the British Westinghouse Co. The operation of this gear was fully described in an article on the electrical equipment of Yarrows' shipbuilding works (ELECTRICAL ENGINEERING, October 7th, 1909, Vol. V., p. 871), where similar plant is installed. Projections on the side of the accumulator operate a tappet switch when the accumulator reaches certain positions, thus starting a small auxiliary motor, which causes the main motor to be started up or stopped, according to the position of the accumulator.

After being shaped and carved, the blocks are dried in chambers heated by hot air obtained from an economiser in connection with the lime kiln. There are nine large steel tanks for treating the stone, and three CO_2 storage tanks. Besides the above-mentioned motors, there is a 35-h.p. motor driving a compressor for the CO_2 plant, and two smaller motors for other work. An electric travelling crane carries the blocks from the presses to the drying chambers and workshops. This has three motors of 7, 7, and 2 h.p., for hoisting and longitudinal and cross-traversing respectively. Most of the wiring consists of braided vulcanised rubber cable supported in porcelain cleats, but there is a certain amount of steel conduit wiring in the extension. The main lighting is by flame lamps run two or four in parallel off auto-transformers.

Reconstructed stone is from 15 to 25 per cent. cheaper than natural stone, according to the amount of shaping and carving, the saving due to working on the stone when soft being very considerable.

An important product of the Company is a form of reinforced glazing-bar, made by embedding a ½ in. square section steel rod in grooved bars of stone for roofs, window mullions, &c. These bars can be of smaller section than is usual with stone glazing-bars, and are very much stronger. Thin reinforced slabs suitable for the floors of switchboard galleries and similar purposes are also manufactured. In these cases, the steel bars are fixed in the mould before pouring in the mixture. Slabs manufactured in this way are far superior to reinforced concrete, as the material is of a much higher density and is pressed close on to the bars. The company also manufactures reconstructed marble suitable for switch panels, and we understand that samples which have been tested have shown high dielectric strength and insulation resistance. It occurs to us that, if this reconstructed marble is otherwise suitable, it should have one great advantage over natural marble or slate for switchboards, as the slabs could be drilled and accurately shaped while still in the soft state, and delivered to the switchboard manufacturer ready for assembling.

In conclusion, we should like to acknowledge our indebtedness to Mr. G. L. Anderson, Manager of the works, for kindly showing us over the plant and explaining the process, and to Mr. H. W. Child for some particulars of the electrical installation.

ELECTRIC SUPPLY ADVERTISING

AN article appeared in the *Financial Times* last week under the title of "Electric Lighting Progress," the general trend of which was to show that the electric supply authorities were not doing all that they might in pushing business, and, in order to make a point, the writer instanced a comparison between the Joint Electrical Publicity Committee and the gas companies, and claimed that the former did not work upon such a well-organised plan as the gas companies. We are pleased to see that these statements were not allowed to go unchallenged, for Mr. H. B. Renwick, Secretary of the Electrical Supply Publicity Committee, wrote immediately to the same paper on behalf of the Electric Supply Publicity Committee, and pointed out that the gas companies had not as yet any combined systematic organisation, although a project was in the air to form such a combination. On the other hand, he showed the wide extent to which advertising and publicity had been carried by the electric supply authorities of London through their joint scheme.

Variable-speed Three-phase Motors.—Mr. J. J. Elink Schuurman writes us that his attention has been drawn by Dr. A. Scherbius to an error in his recent Paper before the Iron and Steel Institute. The Paper was published in abstract in ELECTRICAL ENGINEERING, Oct. 6th, 1910. p. 633, and Fig. 1 of the abstract, represented as the Scherbius system, is now described by him as a general diagram applicable to both the Kramer and Scherbius systems. Another diagram (not given in our abstract) was attributed by Mr. Schuurman to Dr. Scherbius, but is really due to Mr. C. Krämer, whose most important system was illustrated in Fig. 2 of our abstract.

THE FIELD OF THE INDUCTION MOTOR

A PAPER, entitled "The Irregularities in the Rotating Field of the Polyphase Induction Motor," was read by Mr. C. F. Smith at the Manchester Section of the Institution of Electrical Engineers on Tuesday, November 8th. He classified the causes of want of uniformity in the field of the polyphase induction motor as follows :—Non-sinusoidal waveform of the supply voltage; disposition of the stator winding in a limited number of slots; variation of the air-gap reluctance due to the varying position of the teeth and slots of the rotor in relation to those of the stator; want of uniformity of the air-gap due to the rotor being out of centre; the effect of want of proportionality between magnetising current and flux was also mentioned, although of less importance. He then proceeded to describe a number of experiments to determine the extent of this irregularity by measurements of the electromotive forces induced in special search coils wound on the stators of two induction motors, so as to embrace portions of the air-gap flux of the motors. These search coils were disposed in various positions round the stator, and were wound so as to embrace different numbers of stator teeth.

In the first investigation, the voltages induced in the search coils with the rotor stationary and the normal voltage applied to the stator were measured, and these were found to agree almost exactly with the theoretical values calculated on the assumption of a sinusoidal distribution of flux, except for differences due to the lack of uniformity of the air-gap round its circumference, caused by wear of the bearings. Curves of the search-coil voltages, taken when the rotor was supplied with current through the slip-rings, agreed with these observations except for differences due to the cause mentioned above. Alterations in the grouping of the search coils produced consistent results.

The effect of the rotor being allowed to rotate was then investigated. The curve is slightly different in shape from the one taken with the rotor at rest owing to the addition of higher harmonics of voltage, which vary in amplitude for the several coils.

The effects of load on the motor and of driving the motor with open-circuited rotor by means of a separate machine were also tried. No alteration in the induced voltages was to be observed, except for a very slight change caused by the variation in the harmonics, which depend upon the speed of the motor. The coil voltages were also found to be unaffected by a reversal of the direction of rotation of the rotor.

By connecting the rotor slip-rings to the supply and short-circuiting the stator winding, the functions of the two motor windings were inverted, and the search-coils, being regarded as situated on the rotor, instead of on the stator, of an induction motor were employed to examine the voltages induced in a rotor under working conditions. The voltages were lower than when the rotor was stationary, but higher than would be produced by a uniformly rotating field cut with the speed of slip. Another striking peculiarity of the curves was the great difference between the voltages induced in successive coils, which gave them a "saw-tooth" appearance. The two characteristics of the rotor flux indicated by these results are due to want of uniformity of the main rotating field due to the disposition of the stator winding in a limited number of slots, and even more to pulsations produced by the rotation of the teeth of the rotor core. Further experiments were made with a motor driven at its synchronous speed.

Having considered the voltages developed in the individual coils, the next step was to investigate the effect of connecting a number of coils in series to form a complete winding. This was done by joining together several search-coils in series and observing the voltage of the combination. With the supply on the stator, the voltage of the grouped coils was almost identical with that previously observed with the rotor stationary, the higher harmonics of voltage being too small in amplitude to have any appreciable effect.

When the motor was run at synchronous speed with the supply on the rotor, it was evident that the resultant voltage induced by field irregularities in several windings connected in series bears very little relation to the voltages of the individual windings, and is in general much smaller. This effect can be shown to be due to the fact that there are always voltages induced in some coils which are in direct opposition to those being simultaneously generated in others.

The results just arrived at, remarks Mr. Smith, are not without practical importance, since they have a direct bearing on the question of wound rotors *versus* squirrel-cage rotors for short-circuited induction motors. For example, in one case a pulsation voltage of 9·5 volts was induced in the coil wound in a pair of slots having a pitch equal to that of the poles of the motor. This corresponds to nearly 1 volt per turn at the normal voltage. If such a coil were directly short-circuited on itself, as would virtually be the case in a squirrel-cage motor, we should probably obtain a considerable current of high frequency which would not contribute to the torque of the motor. By connecting in series the conductors in several slots, the resultant voltage due to irregularities of the field is much decreased, while at the same time the impedance of the circuit in which this voltage acts is largely increased. The pulsating currents and the heating due to them may thus be reduced to a relatively small value in a wound rotor. On short-circuiting the rotor winding of the induction motor under consideration, while driven at synchronous speed, the slip-ring current was found to have a value of just less than 1 ampere, although the open circuit slip-ring voltage was over 4 volts.

It will be seen from the results that the damping out of high-frequency voltages in the rotor winding depends less on the number of slots per phase than on the relation existing between the spans of the several coils. The same consideration will govern the extent to which the effects of "cogging" will make themselves felt, when full speed has been obtained. In most motors the magnitude of the voltages which are induced in the separate rotor coils is masked by the differential action between the coils, which makes it impossible to measure them. It is, however, evident that the slip-ring voltage at synchronism gives very little information as to the actual amplitude of these pulsations.

Oscillograph records were also taken of the search-coil voltages. An examination of the curves shows that they all consist of a combination of three principal harmonics, and that the differences between them are due to the variety in relative amplitude possessed by these harmonics. These three harmonics are :—A fundamental, or first harmonic, having the frequency of the supply, showing the extent of the change in strength of the flux per pole of the motor; a sixth harmonic, due to the variation in the field produced by the excited winding, not caused by flux pulsation, but showing the influence of the changes of maximum induction and speed of the field, and a twenty-fourth harmonic due to flux pulsation, and dependent for its period on the number of teeth acting upon the winding.

A few remarks are included near the end of the paper on the effects of uneven air-gap, which causes the different coils in the winding to share the flux unequally, and it is noted that the following disadvantages are apt to arise from this cause :—Magnetic drag on the rotor in the direction of the strongest field, concentration of the applied voltage in certain coils of the winding, producing unequal dielectric stresses, increased hysteresis and eddy-current loss in the teeth subjected to high induction, and unequal voltages in the phases of the rotor resulting in an unsymmetrical distribution of currents, varying with the frequency of rotation.

Discussion.

Mr. W. Cramp (Manchester Municipal School of Technology) commented on one or two matters of detail, and thought that account should be taken of pulsations due to slight eccentricity in the mounting of the rotor on the shaft. He thought also that a component of the pulsating voltage might be due to the number of times per second there was a correspondence between the rotor and the stator teeth. This depended on the G.C.F. of the number of slots, and it did not follow that the change would correspond with the flux moved per tooth. The main conclusion to be drawn from the Paper was that pulsation voltages were of importance only in very high pressure machines, and the average induction motor as at present constructed was, on the whole, wonderfully free from effects due to irregularities in its field.

Prof. E. W. Marchant (Liverpool University) referred to some similar experiments made in his laboratory by Mr. Lawson, who had found considerable increase in the losses due to pulsations in the teeth as the load rose; in fact, at full load the magnetic pulsations were sometimes more than double their value at no load. The currents due to these irregularities were small owing to impedance offered on account of their very high frequency. He thought that the most important effect of unevenness of air gap was the inequality of voltage produced in the different phases.

Mr. G. W. Worrall traced from several points of view the

Digitized by Google

agreement between the author's results and those of his own experiments on alternators, and spoke of the greater importance of the effects in the stator teeth than those in the rotor teeth.

Dr. ROSENBERG (British Westinghouse Co.) spoke of the equalising currents which might be set up in the rotor if it were not central, but did not think that these would be of any great value, although every equalising current reduced the fields which set up this voltage.

Mr. J. FRITH suggested that the effect of unequal induction due to uneven air gap could be lessened by connecting coils on the opposite side of the motor in parallel and not in series.

Mr. F. C. ALDOUS said that this was often done, but was impracticable in high-tension motors.

Mr. C. F. SMITH, in reply, said that he did not think the G.C.F. of the slots would affect the flux variation as much as Mr. Cramp had suggested. Losses that might be expected from inequality of the field were not confined to the stator teeth; they would be found in both the rotor teeth also, and in copper losses due to equalising currents set up in the rotor winding. The amount of the latter had not been investigated.

CORRESPONDENCE

MUNICIPAL WIRING.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Referring to your note headed "Bray" in your issue of 10th inst., the statement that my Council contradicted the allegation of the Dublin & Alliance Gas Consumers' Co. that this Council is wiring private premises is incorrect. The circumstances are as follows :—

Bray is a small town thirteen miles distant from Dublin. As there is no local wiring contractor, and as the Dublin contractors naturally charge fairly heavily for sending men out here every time there is a small job going, it became apparent to me that we could do no real good unless, when canvassing for consumers, we were at the same time able to give an estimate for the work and afterwards carry it out if successful in our solicitations. Therefore we have for some years been doing wiring work, and with very successful results. Had we not adopted this course I feel sure that we should have secured practically no fresh consumers during the past few years, and that at a time when they were so urgently wanted, owing to the decreased consumption of existing consumers due to metal filament lamps.

In a town such as this the majority of new consumers do not require more than 10 to 15 lamps per house, and it is unlikely that the contractors from a large city will come here to canvass for these small jobs when there are bigger fry waiting to be captured much nearer home.

Personally I consider that in towns where there are plenty of contractors in competition it is better that contracting work be left to them and that the supply authorities should give the contractors every assistance and encouragement. I believe, however, every municipal undertaking should have full powers to do such work if necessary. Surely it is absurd that it should be legal for certain towns which have obtained a special Act to do installation work and illegal for the smaller towns (where the necessity is more apparent) which are debarred owing to the cost of obtaining a special Act.—Yours, &c.,

WM. J. U. SOWTER,
Engineer and Manager.

Electric Lighting Station, Bray,
November 11th, 1910.

Testing Stations.—We understand that on Friday a Conference of Local Authorities owning electricity undertakings was held at the Islington Town Hall for the purpose of considering the question of taking joint action with regard to the requirements of the London County Council *re* testing stations and the removal of service boxes from the operation of Section 45 of the London Building Act of 1894.

Rating of Tramways.—The Tottenham District Council summoned the Metropolitan Electric Tramways, Ltd., last week for the non-payment of £371 14s. 4d., claimed to be due as balance of the general district rate for the September half-year. The company are fighting the case on the claim that the tramways in respect of which the rate is due, namely, one running from Bruce Grove to Wood Green, was a light railway, and as such should be assessed as a railway at one-quarter the net annual value. The local magistrates decided against the company, being guided in their decision by the result of the Swansea case some years ago. In that case the Swansea Tramway Co. appealed to a Divisional Court, when the decision of the Swansea magistrates was upheld, but the case was taken no further. In the present instance, it is the intention of the Metropolitan Electric Tramways, Ltd., to appeal to a Divisional Court, and, should they lose there, as they anticipate they will, the case will then be taken to the Appeal Court.

ARRANGEMENTS FOR THE WEEK

MONDAY, NOVEMBER 21ST.

Junior Institution of Engineers.
7.30 p.m. At Caxton Hall, Westminster. Fourth Lecture on "The Law Relating to Engineering," by L. W. J. Costello.

Electro Harmonic Society.
8 p.m. Concert (Ladies' Night) at Holborn Restaurant.

Society of Arts.
8 p.m. Cantor Lecture I. on "Industrial Pyrometry," by C. R. Darling.

Institution of Electrical Engineers: Newcastle Section.
8 p.m. At Armstrong College. "Electric Winders," by J. G. Wilson.

TUESDAY, NOVEMBER 22ND.

Institution of Electrical Engineers: Manchester Section.
7.30 p.m. At University. "Street Lighting by Modern Electric Lamps," by Haydn T. Harrison.

THURSDAY, NOVEMBER 24TH.

Institution of Electrical Engineers.
8 p.m. At Victoria Embankment. "Street Lighting by Modern Electric Lamps," by Haydn T. Harrison.

Engineering Exhibition, 1912.—The announcement is made that an Engineering and Machinery Exhibition, promoted by the *Engineering Review*, will be held at Olympia from October 4th to October 26th, 1912. Applications for spaces are already invited.

Lighting of Factories.—At the meeting of the Illuminating Engineering Society last week, it was announced that many Government delegates at the Congress of Hygiene, which was held in Brussels this year, agreed to recommend their Governments to take in hand the question of the illumination of factories, especially as regards the lighting of dangerous machinery. In this connection it was announced that the Home Office have appointed one of their inspectors of factories as its representative in the Society.

Glasgow Local Section of the Institution of Electrical Engineers.—The opening meeting of the session was held on Tuesday of last week, when the chairman, Mr. Sam Mavor, delivered his inaugural address, which dealt with "The Power Equipment of Collieries." An abstract of this will appear in our next supplement on Electrical Engineering in Mines. The secretary (Mr. James E. Sayers) read a communication received from Lord Pentland acknowledging receipt of the Section's expression of condolence on the death of his late Majesty King Edward. It was agreed to contribute £20 towards the proposed Kelvin memorial, which it is suggested to erect at Glasgow University. Mr. W. W. Lackie, in proposing a vote of thanks to the chairman, referred to his intimate knowledge and experience in colliery practice, both at home and abroad. Mr. Mavor had casually mentioned to him earlier in the evening that he had been in Moscow the previous week, where extensive coal-mining operations were in process.

New Method of Producing High-Tension Discharges.—A recent Paper before the Physical Society, by Prof. Ernest Wilson and Mr. W. H. Wilson, described a method of producing high-tension discharges in which energy is taken from an alternating or continuous current source, stored in a magnetic field by an inductance; and then permitted to surge into a condenser which forms with the inductance a *low* frequency oscillating circuit. When the energy is stored in the condenser the latter is mechanically bridged across the primary winding of a spark coil, with which it forms a *high* frequency oscillatory circuit. The energy is then transmitted by the secondary winding of the spark-coil to the work circuit in well known manner. A special contact-making device is used, consisting of a cylinder of insulating material driven by a small motor, carrying suitable contacts upon which brushes bear. The coil of the inductance is connected in series with the primary winding of the spark-coil, and forms one circuit. In parallel with this circuit is placed the condenser. One pole of the supply source is connected to a brush on the contact-maker. The other pole of supply is connected to a tapping point on the inductance suitable for the voltage of supply. The junction of the inductance and the condenser, and the junction of the inductance and the primary winding of the spark-coil are connected to the other brushes on the contact-maker. At the epoch of "make" the current rises in the winding of the inductance and builds up the magnetic field. The condenser also becomes charged and its charging current passes through the primary winding of the spark-coil. At the period of "break" the energy stored in the condenser is added to that in the inductance, and the condenser begins to be charged in the reverse direction. Ultimately the whole energy in the system is stored in the condenser. At this moment the inductance is short-circuited, and the condenser discharges with great rapidity through the primary winding of the spark-coil, and the energy oscillates to and fro. The electromotive force induced in the secondary winding may be of an oscillatory or uni-directional character, according to the nature of the work circuit.

MR. CHURTON'S ADDRESS TO THE YORKSHIRE SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

MR. T. HARDING CHURTON touched on a number of matters in his inaugural address last night as chairman of the Yorkshire section of the Institution of Electrical Engineers. He spoke of the usefulness of the committee on electric driving of textile factories and other fields of activity of the Institution, and passed on to some remarks on the manufacturing side of the industry. He believed that the present unsatisfactory state was due to the productive capacity of our factories exceeding the demand of the market that is open to us, more than to anything else. He outlined some of the directions in which modern designs of machinery were tending, and emphasised the value of standardisation within the factory, although he was not so much in favour of attempts to bring about universal uniformity of details. There was, however, he said, good and sufficient reason for an endeavour to establish agreement as to the definitions of terms used and for the adoption, by general consent, of certain standard specifications respecting the performance of electrical machinery, qualities of materials, and other such matters. He did not consider the attempts of the Engineering Standards Committee in this direction altogether satisfactory. He did not agree with the six-hour run as a test for continuous rating, nor the one-hour run for intermittent rating on account of the very different time constants of different-sized motors. Nor were the standard speeds suggested for each horse-power of much use. The standardisation of voltages and frequencies was, however, of great importance.

A few remarks on technical education followed, and the necessity for a due mingling of the practical and the theoretical was pointed out.

In conclusion, the question of coal conservation was taken up, and the speaker urged the great economies obtainable by the establishment of generating stations on a large scale with large units in connection with collieries, steel works, &c., with high-tension electric transmission. 40,000 to 50,000 volts would be, he thought, quite practicable in this country.

WESTINGHOUSE-LEBLANC CONDENSING PLANT

OUR attention has been drawn to the special advantages of the Westinghouse-Leblanc condensing plant for steam turbine installations, where a very high vacuum is essential for economical working. The principle and construction of the Leblanc condenser and rotary dry-air pump were fully described with illustrations in ELECTRICAL ENGINEERING of May 19th, 1910. p. 323, in connection with the Bahia Blanca power-station, where five sets are installed. The pump may be regarded as a reversed Pelton wheel in conjunction with an ejector, the water being thrown out through the discharge pipe in the form of a rapid succession of films, between which the air is entrapped. There are no reciprocating parts, valves, or waste clearance spaces, and the efficiency is high. The British Westinghouse Electric & Manufacturing Co. (Trafford Park, Manchester) supply these pumps in conjunction with practically any type of condensing plant. A new leaflet issued by the company describes this system as applied to a simple jet-ejector type condenser, a multiple-jet condenser (an improved low-level jet plant, in which there is no liability to backflood the engine or turbine), a barometric-jet condensing plant, and a surface condensing plant. The Leblanc pump compresses the air passing through it, and delivers the vapours at the temperature of the sealing water. This permits the circulating water to be reduced so that the temperature of the hot-well discharge may be within 2° Fahrenheit of the temperature corresponding to the vacuum, and in some cases equal to it. The actual volume dealt with by the pump increases with the vacuum; with reciprocating pumps, however, the reverse takes place, which necessitates disproportionately large pumps. The Leblanc condensing apparatus was introduced on the Continent about five years ago, but it was not until three years later that the apparatus was introduced to the British market. Over 100 sets have already been installed in this country in conjunction with all types of engines, including colliery winding engines, rolling-mill engines, and turbines, and the results are said to have been entirely satisfactory.

The Turin Exhibition.—The Exhibitions Branch of the Board of Trade inform us that a large number of applications for space in the British Industrial Court at the Turin Exhibition have been received. There is also great activity in the direction of securing a representative exhibit of the chemical industries in connection with which a strong committee has been formed. The Association of Chambers of Commerce is also urging the participation of British firms in the exhibition.

THE BRITISH ELECTRICAL INDUSTRY

MR. M. J. RAILING devoted his inaugural address as Chairman of the Birmingham Local Section of the Institution of Electrical Engineers to general questions connecting the welfare of the electrical industry in this country. Want of suitable and profitable employment, or absence of satisfactory returns for the labour or capital spent had made itself felt in the electrical industry for a number of years. Many reasons were brought forward to explain this. There were men who sought the root of the evil in the different way in which engineers were educated in this country compared with other countries. There were others who attributed the more prosperous conditions of rival countries to our present fiscal policy, which was in opposition to the one adopted by the rest of the manufacturing nations, while others again blamed those at the head of the great concerns engaged in financing engineering undertakings, or engineering industries, for want of enterprise. Mr. Railing then proceeded to call attention to the principal changes in circumstances which had taken place in the relations between England and other countries. With the improvement of communication and the more settled state and increasing industrial importance of European countries, many of the conditions which had led to make England the trading country of the world in the past had gone, and but little of the advantages of longer experience remained. Neither were there reasons depending on supplies of raw material or of power why we could manufacture better or cheaper in this country. Taking the two principal materials required in the electrical industry, it was remarked that England had ceased to be the principal iron and steel country of the world, and had to depend almost entirely on foreign supplies for copper. With regard to labour conditions, we were at a disadvantage, and we could, he said, only endeavour to make up the want of balance by the more efficient organisation of our factories and the labour employed in them, by means of careful supervision of the minutest details. He emphasised the necessity for large outputs and a constant flow of work for perfect organisation. If we want to keep our position or "move up," he continued, we must get bigger outputs and larger markets. Other countries do not possess advantages over us in the supply of raw material or power. We possess as good men of science, designers, and engineers, and as capable, if not more capable, workpeople. It is output which we want to give us the lead again, and men who can give us that output; men who know best where to obtain the most satisfactory supplies and what markets are most suited for the disposal of our products. The man he spoke of must know as intimately as possible everything about manufacturing and our manufactures, and at the same time be thoroughly conversant with the language and conditions of the country to which it was desired to sell. More attention should be paid, he claimed, to the training of this special class of commercial engineer. Other countries had stolen a march on us, not so much in the production of engineers nor yet in the production of purely commercial men, but in the development of a type of man who combined the qualities of both. In Birmingham a move in the right direction had been made by the establishment of a commercial faculty at the University; but it was not sufficient to establish such a faculty for training commercial men. A free interchange between the engineering and commercial faculties was needed, so that those whose training was designed primarily to equip them as engineers should study also commerce and commercial subjects. The young electrical engineer abroad was encouraged to study, in addition to his own science, the technology of allied trades, and to train himself as well in languages, in commercial law, in natural economy, and in commercial routine generally. He pleaded that such a course might some day be adopted in this country as well. The commercial side of engineering should, he thought, also be more considered in the system of apprenticeship.

The L.C.C. Tramway Subway.—At the meeting of the Institution of Civil Engineers, Mr. G. W. Humphreys read a paper on "The London County Council Holborn to Strand Improvement and Tramway Subway." The author dealt with the construction of the Kingsway and Aldwych thoroughfares with their pipe and cable subways, and of the tramway subway from Holborn to the Strand, which links up the north and south sections of the L.C.C. tramways. For a description of the last portion of this subway to be opened reference may be made to ELECTRICAL ENGINEERING, Vol. III., page 343, March 5th, 1908, where drawings of the special form of conduit used will be found.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published November 10th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

16,447/09. **Train-lighting Dynamo.** A. H. MIDGLEY and C. A. VANDERVELL. (London.) A reversible self-regulating dynamo has the brushes in the normal position relatively to the main poles which are not excited. Auxiliary wound poles are provided in the commutating zone, and induce heavy currents in the short-circuited coils. These local currents set up a cross-magnetising flux which distorts the inducing flux into the main poles, and thus causes an E.M.F. to be generated in the working part of the armature winding. The distortion will be in one direction or the other, according to the direction of rotation, and consequently the current taken from the brushes will always be in the same direction. As the reaction of the working current is exactly opposed to the inducing poles, the output of the dynamo will remain practically constant at all speeds. Three figures.

20,867/09. **A.C. to D.C. Transformation.** A. M. TAYLOR. This specification describes a transforming apparatus consisting of specially wound transformers working in conjunction with a rotary switch or commutator driven by a synchronous motor. The transformer has two secondary coils wound in opposite directions and connected in series direct with the D.C. circuit. The switch short-circuits the coils alternately while they are giving an E.M.F. in the wrong direction. Methods of increasing the period during which the E.M.F. is nearly zero, and of eliminating the pulsations from such a rectifying system, are described. Thirteen figures.

24,112/09. **Gyroscopic Stability Mechanism.** S. Z. DE FERRANTI. A pair of gyroscopic units are interconnected in such a manner as to impart stability to a body such as a monorail car, ship, aeroplane, or submarine, equally in all directions. Means for allowing inclinations in certain directions and not in others are provided. The invention is described in relation to the steadying and control of an aeroplane driven by two motors of the Gnome pattern arranged with their axes vertical, and driving the propeller through bevel gearing. Each motor constitutes a gyroscopic unit, and is mounted so that it can swing in any direction. To ascend or descend, the gyroscopic system is locked, so that it loses its controlling effect in the longitudinal vertical plane. A method of accelerating the precession of the gyroscopes in order to render an initially unstable body stable (see ELECTRICAL ENGINEERING, Nov. 18th, 1909, Vol. V. p. 977) is also described. Thirteen figures.

24,126/09. **Frequency Changer.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*). A synchronous double-current alternator or frequency changer comprises a machine with a single armature and field system. The armature has coils forming two windings of different pole numbers, and the field system has two component magneto-motive forces corresponding in pole numbers to the two pole numbers of the armature. The voltages of the two currents generated may be varied independently. When running as a frequency changer with a constant voltage on the motor side, the voltage on the generator side may be varied. Three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: HIRST and ANGOLD, 29,069/09; BLACKWELL, 2,263/10; REGINA-BOGENLAMPENFABRIK GES. [Alloy for supports for carbons] 6,523/10; W. C. HERAEUS GES. [Starting means for mercury vapour lamps] 8.125/10; HEIMANN and SCHAFFER [Working arc lamps in series with metal filament lamps] 11,581/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: LILIENTHAL and LAUER [Treatment of mica] 4,980/10.

Dynamos, Motors and Transformers: SMITH and GOOD [Machines] 25.144/09; LECOCHE [D.C. motors] 25.230/09; ALLGEMEINE ELEKTRICITÄTS GES. [Machines] 15,753/10.

Electrometallurgy and Electrochemistry: EYCKEN, LE ROY and MORITZ [Electrolytic production of oxygen and hydrogen] 24,716/09; SCHOTT and GEN [Electrolytic apparatus with liquid anode] 6,597/10; DURA ELEMENTBAU GES. and LESSING [Primary cells] 8.810/10; KAISER [Electrical manufacture of nitrates] 12,229/10.

Heating and Cooking: BERRY [Heating apparatus] 24,813/09; TREPREAU [Heating apparatus] 24,829/09; REGINA BOGENLAMPENFABRIK GES. [Alloy for withstanding heat of arc in soldering and other tools] 6,523/10.

Incandescent Lamps: ALLGEMEINE ELECTRICITÄTS GES. [Exhausting apparatus] 15,754/10.

Instruments and Meters: ROEKE [Thermostats] 25,254/09; GEISSINGER [Thermostats] 25,819/09.

Storage Batteries: SCHNEIDER [Manufacture of positive plates] 3,631/10.

Switchgear, Fuses and Fittings: SHEWARD [Lamp-holders] 23,634/09; BLOCH [Connectors for alarm circuits] 24,076/09; MILNE [Wiring conduit and accessories] 24,561/09; SCHEIBE [Control gear for vapour devices] 1,483/10; ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Electro-magnetically controlled switches] 7,465/10; DEY [Switches] 12,489/10 and 12,490/10.

Telephony and Telegraphy: MONTAGNA [Telegraphic transmission of pictures] 15,734/10.

Traction: A.-G. BROWN, BOVERI & CIE [Electric drive for railway vehicles] 24,843/09; WINTERS [Combined trolley-wire hanger and circuit-breaker] 3,383/10; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Signalling] 3,982/10; DUDGEON [Trolley-wire insulators] 4,716/10.

Miscellaneous: EVERSHED, KILROY, and EVERSHED & VIGNOLES, LTD. [Motor-driven apparatus for the production of sound for signalling] 16,895/09; DIEMEL [Pocket igniter] 21.130/09; DIXON [Capstans] 24,249/09; ANDERSON and HOLMES [Fire-damp detector and indicator] 24,371/09; FAIRBURN-HART (*Electric Renovator Manufacturing Co.*) [Vacuum cleaning apparatus] 24,766/09; BLOCH [Burglar alarm] 2,824/10; DOBSON [Electrically-operated locks] 6,915/10; SIEMENS & HALSKE A.-G. [X-ray apparatus] 13,765/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution Systems, &c.: PETERSON [Manufacture of insulating material] 23,671/10.

Electrochemistry: BILLON-DAGUERRE [Sterilisation of liquids by ultra-violet rays] 24,025/10.

Instruments, &c.: BLONDEL [Photographic records of oscillographs, &c.] 22,576/10.

Miscellaneous: VIETTE [Bell call indicating apparatus] 18,678/10; FELTEN & GUILLEAUME-LAHMEYERWERKE A.-G. [Winches] 21,833/10; SANCHEZ [High-frequency apparatus] 24,143/10.

The following amended Specification can now be obtained.

JOHNSON AND PHILIPS and BROCKIE [Arc lamps] 15,287/09.

Application for Revocation

15,798/09. **Electric Block Signalling System.** J. D. TAYLOR. As a result of the application for the revocation of this patent (*see* ELECTRICAL ENGINEERING, February 10th, 1910, p. 100), the Comptroller has ordered an amendment to the specification. The patent is for an automatic block signalling system, in which electrically continuous rails are used.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

26,191 of November 19th, 1896. **Peat Fuel.** E. T. ZOHRAB. This specification describes a machine for pulping and moulding peat, and a process of drying and carbonising the blocks produced.

26,249 of November 20th, 1896. **Heating Apparatus.** H. J. DOWSING. This patent covers the combination of a glow-lamp with a special form of conical or angular reflector to throw the heat rays outwards. Arrangements of one or more such reflectors in heating or cooking apparatus are described.

26,251-3 of November 20th, 1896. **Electric Firing Device for Ordnance.** VICKERS, SONS & Co., A. T. DAWSON, and G. T. BUCKHAM. The first of these two patents relates to a combined electric and friction firing gear with safety devices; the second covers a construction for an electric primer.

26,616 of November 24th, 1896. **Reflectors.** S. O. COWPER-COLES and REFLECTOR SYNDICATE, LTD. Reflectors are manufactured by depositing electrolytically a backing of base metal upon a coating of silver applied to a mould of suitable form. A protective coating of palladium may be added. Certain details in the process, including the strengthening of the silver film before the electrolytic treatment, and a method of detaching the finished reflector from the mould, are also covered by the patent.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: O. WILHELMI [Protection of underground cables] 15,149/01.

Dynamos, &c.: A. RAKY [Electric winding-engines and pit-head gear] 16.416-8/04.

Incandescent Lamps: G. WEISSMANN [Capless lamps for glass-bead festoons] 16,391/02.

Instruments, &c.: W. HAMILTON and FERRANTI, LTD. [Meter counting trains] 15,498/05.

Telephony, &c.: G. E. SCHMIDMER [Telegraph wire coupling] 16,762/04.

Miscellaneous: A. BARR and W. STROUD [Electric signalling dial apparatus] 17,434/97; C. W. BLUEMEL and P. R. SELL [Electrically-controlled pneumatic and belt dispatch systems] 16,650/04; A. HEIN [Vacuum cleaner] 26,357/05.

ELECTRICAL TESTING OF WATER

AN electrical apparatus, designed by Messrs. Digby and Biggs, for the testing of water has been introduced by Evershed and Vignoles, Ltd. (Acton Lane Works, Chiswick, London). It is founded on the principle (explained in an original communication to the Institution of Electrical Engineers by Mr. W. Pollard-Digby and abstracted in ELECTRICAL ENGINEERING of July 21st, 1910, p. 478) that the conductivity of water is a good indication of the degree of hardness.

The apparatus consists of a glass U-tube, the bend of which is connected with a drain-pipe of rubber closed by a pinch-cock, and to a third vertical tube ending in a funnel for filling. An electrode consisting of a ring of platinum strip is fixed at the top of each arm of the U-tube. The tube, after being washed out, is filled with the water to be tested, and the electrodes are connected by a twin-flexible and plug to a sealed box containing a direct-reading conductivity meter and a D.C. hand-driven generator. The latter combination is similar in many respects to the well-known Evershed "Megger" for insulating testing; the dynamo generates at 100 volts, when the speed of turning is such that the clutch is felt to slip, and the meter then reads direct in conductivity units (the reciprocal of megohms). By giving the electrodes a large surface and using a long tube, variations in conductivity due to gas bubbles on the electrodes has been practically eliminated. The back E.M.F. of polarisation (about 2 volts) is allowed for in making the scale. As the conductivity varies with the temperature, this is measured, and the reading corrected by means of a table. A chemical analysis is necessary in the first case to determine the nature of the impurities in the water, as this apparatus does not discriminate between the different dissolved substances. It indicates and measures as a percentage any change in hardness, however, showing what alterations are required in the softening process. The actual degree of hardness in grains per gallon may be deduced at any time from a curve which is plotted at the time the chemical analysis is made. Various uses of the apparatus were described in the article referred to above. One important application is for the testing of surface condensers. As any leakage of the cooling water (which generally contains dissolved matter) into the condenser increases the conductivity of the hot-well water, a test on the latter will indicate the slightest leak. Taking the conductivity of distilled water at 2, the addition of 1 per cent. of London tap water will raise it to 7, while 1 per cent. of sea water will raise it to 620. Boiler priming is detected in a similar manner. We understand that Messrs. Evershed and Vignoles will send to any of our readers on application an illustrated booklet describing this apparatus and its use.

THE ELECTROBUS COMPANY AND ITS BATTERIES

THE action by Mr. C. A. Gould, of the Gould Storage Battery Company of America, against Dr. E. H. Lehwess in respect of a contract for the supply of batteries for the London Electrobus Co., was continued before Mr. Justice Ridley and a special jury in the King's Bench Division on Wednesday, Thursday, and Friday last week. In our last issue we dealt with the case for Mr. Gould. On Wednesday further evidence was given to show that whilst the Electrobus Co. officials refused to allow the official tests of the batteries, as provided for in the agreement between Mr. Gould and Dr. Lehwess, to be carried out, what were termed secret tests were made by the representative of Mr. Gould in this country, with the result that one battery lasted for four hours 15 minutes, at a discharge rate of 80 amperes, which was better than the test provided for in the agreement. Evidence was also called to show that the batteries had been sold for old metal, and that the London Electrobus Co. had received a cheque for about £100 in this connection.

Mr. Duke, K.C., addressed the Court on behalf of Dr. Lehwess, arguing that there had been no fraud on his part, as the whole question turned upon the construction of the agreement, which Dr. Lehwess had read differently from Mr. Gould. He urged that Dr. Lehwess had not made a penny out of the transaction, and, indeed, had lost two years' work upon the scheme, and had been put to considerable expense. With regard to the point that a cash capital of £25,000 was to be provided, Mr. Duke remarked that this could hardly have been in Mr. Gould's mind, as he himself was to receive £13,750 in fully-paid shares, and it could not be said that Dr. Lehwess was going to pay this amount of cash into the Gould Storage Battery Co. after he had already refused to buy the Gould English patents for £10,000. He argued that there was no evidence that Dr. Lehwess had prevented the tests from being carried out, but that, in fact, the batteries were never in a condition to pass the tests prescribed in the agreement.

Dr. Lehwess gave evidence to the same effect, and stated his impression that in America the term "cash" capital meant "nominal" capital. He admitted that the Asiatic Banking Corporation, to which he had allotted 21,000 shares, was a sham company altogether, but that he had used it as a nominee in order to transfer the 13,750 shares to Mr. Gould.

At the end of Dr. Lehwess's cross-examination the jury handed up a note to the judge intimating that they had heard sufficient of Dr. Lehwess's case in defence, and as a result the parties conferred and came to an agreement by which Mr. Gould was paid.

RAILLESS ELECTRIC TRACTION AT LEEDS

WE understand that considerable progress has been made in the scheme for running trolley-omnibuses in Leeds, in accordance with the powers recently acquired by the Corporation. The route over which powers have been obtained is about four miles in length. On about a mile of that a tramway is already in operation, and the railless vehicles will use the ordinary trolley wires for the positive current, and additional wires, one on each side, will be put up for the negative return. This part of the overhead equipment is by side poles and bracket arms, and the same method will be continued along the new part of the route. The number of vehicles with which a start will be made is four, and contracts for the complete vehicles have been placed with the Railless Electric Traction Co., 56 Moorgate Street, E.C. The body will have a single deck with 28 seats on cross benches. As the route is very thinly populated, and the traffic will be light, it is anticipated that it will not be necessary to employ a conductor, and therefore the entrance and exit is alongside the motorman. We are unable to give, at this stage, any particulars of the electrical equipment of the cars, other than they will be driven by two motors, and will embody several improvements on the earlier designs of the company.

LINKING UP THE LONDON ELECTRICITY WORKS

GOOD progress is being made by the Joint Committee of London Borough Councils and Companies, which was formed immediately after the passing of the London Electric Supply Act of 1908, to prepare some proposals for linking up the whole of the electricity works in London. The Committee of Investigation which was appointed presented a preliminary report, in which recommendations were made that there should be uniformity in the systems of linking up; that a pressure of 10,000 volts, three-phase, 50 periods, should be employed for the ring mains: and that there should be an agreed unit of converting plant, namely 500 kilowatts, which could be used singly or two or more in parallel, as circumstances might demand. The result of this preliminary report was the appointment of a consultative committee of twelve members, six representing borough councils, and six companies. We now understand that a report has been drawn up by the engineers on both sides, which has been under consideration by the Consultative Committee, and that the latter will shortly issue a report upon the whole question.

THE G.B. SYSTEM IN THE MILE END ROAD

AN action was commenced in the King's Bench Division on Tuesday, before Mr. Justice Ridley and a special jury, in which Mr. William Griffiths, as owner of the G.B. surface-contact traction patents, sued Sir John Benn for libel in respect of certain statements made by him relating to the G.B. surface-contact system.

Mr. F. E. Smith, K.C., M.P., said that the action was for libel, slander, and disparaging statements, the defence being that they were made on privileged occasions, that they were statements of fact, true, and in so far as they were expressions of opinion, they were fair comment made *bona fide* without malice. But the plea of justification was not made. Counsel's opening statement on behalf of Mr. Griffiths dealt in great detail with the circumstances of the experiment by the London County Council with the G.B. surface-contact system in the Mile End Road. Owing to the fact that the London County Council insisted upon the contract with the G.B. Surface-Contact Co. being in terms of a licence to use the system on payment of a royalty, the G.B. Company had taken no part in the laying down of the system, nor its working. He alleged that the officials of the London County

Digitized by Google

Council who were responsible for this had no knowledge of the system, and that they were the cause of its complete failure, for which the G.B. Company had had to suffer. The libels complained of were contained in letters and articles in the Press and public speeches, all bearing directly upon the experiments with the G.B. system in the Mile End Road. Among the statements complained of were "stud tramway fiasco"; "the system is described as the G.B. system, but its label should be really 'Moderate'"; "jerry-built tramways"; "live stud system"; "let us have an efficient system"; "company considerations prevailed"; "start ripping up this mischievous and impossible system"; "a system which all competent experts have declared entirely unsuited to London." All these and a number of other extracts from further speeches and articles by Sir John Benn were alleged to be highly damaging to the prospects of the G.B. Surface-Contact Co., and that, in fact, the company had been absolutely ruined as a result. No corporation now, said Mr. Smith, would think of looking at the system, and negotiations with regard to putting it down in Paris, Oxford, Folkestone, and elsewhere had fallen through. Indeed, the company had not thought it worth while to keep up the foreign patents. The complaint was that the system which was condemned by the London County Council was not the G.B. system at all, inasmuch as the company were refused all along any share in its construction or maintenance; and had Sir John Benn stated that the system, as modified by the London County Council's officials and put down in the Mile End Road, was inefficient, there would not have been so much cause for complaint, but throughout all his statements he was specifically referring to the G.B. system, and cared not whether he ruined the owners of the patents or not, as long as he was able to score a point off his political opponents.

After having mentioned that the system has been working with perfect success at Lincoln for five years, and that the Board of Trade have granted the first permanent certificate for it there, Mr. Smith dealt in detail with the manner in which the system had been modified by Mr. Maurice Fitzmaurice, the County Council's chief engineer, and Mr. Fell, the chief officer of the tramways, in spite of continual protests by the inventors that a failure would inevitably result. The equipment of the cars was carried out by the Tramways Department of the London County Council, and the fact that the London County Council reduced the amount of the royalty payable from £800 to £500 per mile, on the ground that their staff would not require any technical assistance from the company, was an endeavour to get something for nothing. The access boxes were so designed that gas, water, and mud found their way into them, and explosions resulted, as well as short-circuits. Instead of, as at Lincoln, having a water-tight system, as much as a bucket of water a month was taken out of the sump-pits; instead of having a closed conduit system for carrying the conductor, connections were made between the underground conduit and the sewers, which allowed more gas to accumulate; the Roots blower for ventilation in use at Lincoln was dispensed with, and as a substitute, on the day of the first trial, the tramway staff appeared on the scene with a vacuum cleaner. Similarly, Mr. Fitzmaurice had re-designed the stud, and Mr. Fell the car equipment. The correspondence showed that from the very beginning the G.B. Surface-Contact Co. were dissatisfied with both the road equipment and the car equipment, and were repeatedly calling the attention of the County Council to the matter. Another detail mentioned was that insulators were placed near pieces of special track work where fractures were unavoidable, and in positions against which the County Council officials had been warned. Unsatisfactory working was the inevitable result, and as a consequence the company had offered to put the whole thing in order at their own expense. Sir John Benn, continued Mr. Smith, had made the statement that the system had been condemned by all experts at a time when he knew the contents of Mr. Mordey's report that the system could be made easily workable by a few minor alterations. As a matter of fact, he said, Sir John Benn, though criticising the system in the manner he had, knew no more about it than he did of the mineral resources of Timbuctoo. Mr. Smith described Sir John Benn's statements as "absolute falsehoods," "flagrantly unfair," and "unworthy sneers," all made in the venomous and bitter atmosphere of political party criticism. Mr. Smith occupied the whole of Tuesday and a portion of Wednesday in his opening speech.

LOCAL NOTES

Acton: *Electricity Works Transferred.*—In connection with the proposal to transfer the electricity works to the Metropolitan Electric Supply Co., it was decided by 11 votes to 10 at a special meeting of the Council last week to take a referendum of the ratepayers in question, as there seems great difference of opinion on this matter.

Belfast: *Wiremen and Jointers.*—The Electrical Trade Union have sent the City Electrical Engineer a list of rules which they wish applied to jointers as well as wiremen. As these do not conform with the requirements of the Electrical Department, the Committee have decided not to adopt them. The difficulty is chiefly in connection with wages, and this matter the Committee deal with at no other time than January or February each year.

Bognor: *Electric Lighting.*—The Council have decided to apply for an electric lighting provisional order.

Bournemouth: *Tramways.*—The Board of Trade have approved the plans of the proposed change of tramways from the conduit to the overhead system.

Burnley: *Tramway Speed.*—The Board of Trade have refused to increase the speed of the tramcars in Brierfield from 12 to 16 miles per hour.

Canada: *Toronto: Overhead Mains.*—The Toronto Electric Light Co. have applied for an injunction to restrain the engineers of the City Electric Light Co. from placing their electric power mains and poles in dangerous proximitiy to those of the Company.

Dunfermline: *Electric Lighting.*—An agreement transferring the Council's Provisional Order to the Fife Electric Power Co. has been completed. It provides for the re-transfer of the Order to the Council at the end of thirty years.

Friern Barnet: *Electric Lighting.*—The Council have consented to the Finchley Council applying for an order under the Electric Lighting Act, 1909, to supply electricity in Friern Barnet.

Golborne: *Electric Lighting.*—A Sub-Committee of the Council is at present negotiating with the Lancashire Electric Power Co. with regard to electric supply.

Kendal: *Overhead Wires.*—An application has been made to the Board of Trade by the Corporation for consent to erect a number of overhead wires for transmitting electrical energy at a pressure of 440 volts.

Lisbon: *Tramway Strike.*—The electric tramways in Lisbon have ceased running owing to a strike of the power-house staff.

Liverpool: *Damages for Tramway Accident.*—At the Liverpool Assizes last week damages to the amount of £400 were awarded against the Liverpool Corporation in respect of an accident to a Miss Marshall, who was injured through colliding with one of the Corporation tramcars whilst she was riding a bicycle. The evidence showed that the driver of the car was travelling at an excessive speed.

Llanelly: *Electric Lighting and Tramways.*—The Llanelly & District Electric Traction Co. expect to have the streets lighted by December 14th or 15th, and the tramways running by April.

London: *Kensington: Tramways.*—The Council have decided to consent to the proposed tramway by the London County Council through the northern part of the borough, linking up the lines in Wood Lane and Harrow Road.

Marylebone: Street Lighting.—The Lighting Committee report that a further 89 additional street lamps have been converted from gas to electricity, making a total of 3,459 public street lamps now lit by electricity.

Manchester: *Charges for Power Supply.*—At a Local Government Board inquiry last week concerning a loan of £30,000 for a new turbo-alternator at the Stuart Street power house, the Manchester Ratepayers Association opposed the loan in order to ventilate a grievance they think they have against the policy of the Electricity Committee in regard to its charges for power supply. They also complained that the Tramways Committee should be charged more than cost price for their electricity, and that larger sums should be placed to depreciation and reserve. The suggestion was also made that the Electricity Department was "slowly murdering" the Gas Department, as the Gas Department paid more in relief of rates each year than the Electricity Department. Mr. S. L. Pearce, the City Electrical Engineer, refused to disclose prices charged to certain large consumers, for the reason that it would be to the disadvantage of the Department to do so. He denied that there was any loss upon these contracts, and said there was a slight profit directly, in indirect profit, in the abatement of the smoke nuisance.

Digitized by Google

Dealing with the contentions of the Ratepayers Association, the Town Clerk pointed out that the Electricity Department had never drawn one penny from the rates, but, on the other hand, £86,480 had been paid in relief of rates.

Portrush: *Electric Lighting.*—Having considered the report of Messrs. Miller, Wilson & Pegg with regard to electric lighting, the Council have decided to apply for a Provisional Order.

St. Anne's-on-Sea: *Electricity Accounts.*—The accounts of the electricity undertaking for the year to March 31st shows a net surplus of £1,243, of which £1,000 has been transferred to relief of rates, and the balance placed to reserve.

Stanley: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the electric lighting order granted to the Council in 1902.

Torquay: *Tramways.*—A conference took place in London last week between the representatives of the Council and the Tramways Company to discuss various points of difference in relation to the conversion of the tramways to the overhead system, and according to a statement given out afterwards, an amicable settlement has been arrived at. It is also understood that the Tramway Company have agreed to pay the greater portion of the arbitration costs.

West Hartlepool: *Tramway Purchase.*—The Council have at last definitely decided to purchase the local tramway company. The company had made a proposal that their powers should be extended for a further term of 42 years, and the notice to purchase withdrawn by the Corporation. These terms, however, were not accepted.

Worcester: *Municipal Wiring.*—The Electricity Committee have received a further deputation from electrical contractors in the city, and have discussed the proposed Sales Department of the electricity undertaking. The contractors distinctly refuse to recognise any form of trading whatsoever by the Electricity Committee, and the Committee discussed at their last meeting a proposal that the Department should pass on to local contractors or to manufacturers of heating and cooking apparatus and motors any orders they may obtain. It was also decided upon that the Department is not to undertake the sale of fittings or lamps or the wiring of houses, and that the Council are not to be liable for the price of goods sold. When a resolution to this effect was put, it was carried by the casting vote of the Chairman.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Barnes.—The Electrical Engineer recommends the installation of an additional 750-kw. generating set.

Baroda.—A scheme is on foot for the conversion of the Baroda horse tramways to electric traction.

Birkenhead.—An inquiry was held last week concerning a loan of £2,000 for a turbo-generating set. The inquiry was adjourned for certain particulars to be furnished to the inspector.

Dunoon.—The proposals of a company to construct tramways in the town are being received favourably by the Council, who are inclined to erect a power station for supplying the necessary electrical energy.

Hastings.—Application is to be made for a loan of £2,083 for mains.

Ireland.—A scheme for the electric lighting of Dromore has been prepared by Messrs. Miller, Wilson & Pegg.

Messrs. Wilkins & Burden, Consulting Engineers, of Dublin, propose to erect a generating station and to use overhead wires in Ballymoney.

The same firm of consulting engineers have placed a similar proposal before the Enniskillen Council.

Llandudno.—A Local Government Board inquiry was held last week concerning a loan of £2,322 for mains and services. On the suggestion of the Inspector, Mr. H. R. Hooper, it was decided to purchase services out of revenue and to reduce the loan by £256.

Londonderry.—Extensions of the generating station to the extent of £9,000 are contemplated.

Manchester.—A Local Government Board inquiry was held last week concerning a loan of £30,000 for a turbo-alternator at the Stuart Street works.

Netherlands.—A Commission has been formed, says the *Board of Trade Journal*, under the presidency of Mr. J. E. Schalten, with the object of constructing a central electric generating station for the provinces of Groningen, Drente, and Overijssel.

Russia.—From a Parisian source the *Board of Trade Journal* states that the municipality of Tiflis will shortly invite tenders for the erection of a power house.

South Africa.—The Queenstown (Cape Province) Municipality are proposing to instal electrical plant.

Venezuela.—An electric power house is to be erected in connection with a Custom House at Ciudad, Bolivar, and the *Board of Trade Journal* announces that the name and address of the main contractor for the harbour works is on file at 73 Basinghall Street, London.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Cinematograph Hall, Coldharbour Lane, Brixton.

Proposed Oriental Theatre, 226 Commercial Road, E.

Empire Picture Palace, 225 Streatham High Road.

New drill hall in Old Deer Park, Richmond. Territorial Force Association.

Extension of Queen Alexandra wing at British Home for Incurables, Crown Lane, Streatham.

New building for nurses at the Infirmary, Southwark.

Concert hall at 133 Commercial Road, E.

Music-hall in Euston Road, N.W.

Cinematograph theatre, 17 Highgate Hill, N.

PROVINCES.

Aberdeen.—Children's hospital.

Accrington.—Extension of Messrs. Higham's mill. Architect, H. Ross, 15 Cannon Street, Accrington.

Airdrie.—New Town Hall.

Altrincham.—Twelve houses. The Council.

Bath.—Electric theatre in Southgate Street.

Blackpool.—Additions to Grand, South Shore, and Victoria Hotels.

Extensive reconstruction of Winter Gardens and H.M. Opera House.

Blyth.—New secondary school. Clerk to Governors, Bridge Street.

Bolton.—New Church Schools.

Bournemouth.—Rebuilding of Victoria Hotel. Architect, Mr. H. Hawker, St. Peter's Chambers.

Bridlington.—Purchase of People's Palace for conversion to Town Hall.

Chislehurst.—Cinematograph theatre.

Christchurch.—Infirmary. Builders, Messrs. Jones & Seward.

Clydebank.—Offices, &c., at Messrs. John Brown & Co.'s works.

Coventry.—New municipal buildings and Town Hall.

Dalkeith.—Drill Hall. Midlothian Territorial Force Association.

Darlington.—Extensions to Infectious Diseases Hospital.

Proposed sanatorium for consumptives.

Deal.—New Salvation Army hall.

Dundee.—Warehouse in Don's Road.—Alterations to Hawkhill School.—Installation of electric lighting at King's Cross Hospital.

Dunfermline.—Aerated water factory in Townhill Road.

Edinburgh.—Building in Northfield Avenue for J. MacFarlane & Co. Architect, J. I. Adams, 34 St. Andrew's Square.

Falmouth.—Pavilion in Gyllyndune Gardens. Town Clerk.

Ilkeston.—New Secondary School.

Keighley.—Extensions to Nurses' Home.—Also alterations at Workhouse Infirmary.

Kettering.—All Saints' Church.

Kilmarnock.—Extension to Messrs. Glenfield & Kennedy's Works. Alterations at factory of Saxone Shoe Co.

Lanark.—School in Wishaw Road.

Lancashire.—Proposed mill at Great Harwood. Mutual Mill Building Co., Windsor Road.

Leeds.—Rebuilding of Corporation gas premises, Meadow Lane.

Lincoln.—Extension of Monk's Road School.

OSRAM·LAMPS

Digitized by Google

Llanelly.—Proposed theatre.
Londonderry.—Rebuilding of Guild Hall.
Manchester.—Sanatorium for consumptives. South Manchester Guardians.
Middlesbrough.—Alterations and extensions to Linthorpe School.
Morley.—Offices and workshops at Messrs. Ackroyd & Best's works.
Neath.—Proposed school on the Eagle's Bush Estate.
Newport (Mon.).—Proposed Primitive Methodist Church.
Newton Abbot.—Drill Hall for St. John Ambulance Corps.
Oswestry.—New Welsh Church.
Plymouth.—Barracks at Millbay for Territorial Force Association. Architect, F. A. Clark, 83 Old Town Street.
Poole.—New school in South Road.
Reading.—New police station, sessions house, &c.
Rochester.—Two shops and dwelling-houses in High Street. Trustee of Richard Watt's Charity.
Scarborough.—Extensions to sanatorium.
Stafford.—Council school at New Chapel.
Stirling.—New municipal buildings.
Stockport.—New church at Great Moor.
Stockton.—School in Yarm Road.
Truro.—New mill at Malpas Road. Architect, Mr. A. J. Cornelius.
Woking.—Proposed workmen's home.
Wolverhampton.—Extensions and alterations to Royal Orphanage. Architect, F. T. Beck, Wulfrun Chambers, Darlington Street.

MISCELLANEOUS

Australia: The *Board of Trade Journal* states that tenders are invited by the Deputy Postmaster General at Melbourne on December 6th for cable-testing instruments and 6,000 jacks. Tenders are also invited by the Deputy Postmaster General at Adelaide until December 29th for the supply of line material, telephone and telegraph instruments, also telephone cable. The Deputy Postmaster General at Sydney invited tenders by January 4th for three multiple magneto switchboards. Copies of Specifications, &c., may be had at 72 Victoria Street, London, S.W., or 73 Basinghall Street, London, E.C.

Calcutta.—The Calcutta Electric Supply Corporation require tenders to their London office by December 1st for overhead electric and hand cranes.

Chili.—The Chamber of Deputies, according to a Reuter message, has requested the Minister of Public Works to give preferential treatment to the Bill for converting the railway between Santiago and Valparaiso and of the Andes branch to electric traction.

Japan.—Large extensions of the telegraph and telephone systems in Korea are contemplated. A new submarine cable is also to be laid at an estimated cost of £65,000.

The Japanese Railway Board, says the *Board of Trade Journal*, have decided to lay down a narrow-gauge electric railway alongside the railway track from Yokohama to Tokio.

South Bank.—The Cleveland & Durham Electric Power Co. have asked for the Council's sanction to carry out street lighting by means of overhead wires.

Sand Fire-extinguishing Equipment.—A sand fire-extinguishing equipment has recently been supplied by Messrs. Merryweather & Sons, of Greenwich, to a prominent London electric light company for the protection of their power station. It comprises a three-wheeled galvanised sheet steel sand-truck, and holding about 6 cwt. The sand can be taken from the top, hinged covers being provided to open from either end, or it can be shovelled into a bucket from the side, in which a sliding-panel is fitted. When the sliding-panel is raised, a peg is inserted in a hole in the side of the truck to prevent the panel from dropping down. A fibre bucket is carried on a bracket at the back, and two strong wooden spades are supported on suitable iron brackets at the side. In another form, the sand-bin is of larger capacity (holding about 8 cwt. of sand), and mounted on legs instead of wheels. It is equipped with two fibre buckets and two spades, and has a hinged cover at the top and a sliding-panel at the side.

TENDERS RECEIVED AND ACCEPTED

Australia: *Sydney.*—The tender of the British Insulated & Helsby Cables, Ltd., at £10,610, has been accepted for the supply and laying of low-tension cables. The tender of the Standard Waygood Co. for alterations to lifts in the Town Hall and Queen Victoria markets has also been accepted. Two additional D.-C. feeder panels are to be ordered from the Australian General Electric Co., Ltd., at £816, erection costing an additional £78.

Blackburn.—The Board of Guardians have accepted the tender of Mr. H. Garstang, of Darwen Street, for an installation of private telephones.

Crompton.—Messrs. Edmundson's Electricity Corporation have received the contract for the electrical equipment of the sewage works.

London: *County Council.*—The tender of the British Westinghouse Co. for the supply and erection of standard-type controllers, electrical interlocking gear, and additional cables for a hundred double-deck cars, is recommended for acceptance at £6,490. The tender of Messrs. Matthews & Yates for the supply of cooling fans and filter frames for the fitting two turbo-generators at the Greenwich power house has been accepted at £374.

South Africa.—The tender of Messrs. Reunert & Lenz for £5,608 for additional machinery at the Randfontein Municipal Power Station has been accepted.

Wigan.—The following tenders have been received for the supply of two electrically-driven centrifugal pumps at the Boar's Head pumping station:—Worthington Pump Co., £439; Tangyes, Ltd., £414; Drysdale & Co., Ltd., £[illegible]; Holden & Brooke, Ltd., £468; G. Mills & Co., Ltd., £[illegible]; E. Scott & Mountain, Ltd., £425; Rees Roturbo Co., Ltd. (accepted), £389; Johnson Bros., £405 and 461; Tickle Bros., £417, £455, £437, and £462; Pulsometer Engineering Co., £377; Corlett Electrical Engineering Co., £377; and I. Stott & Sons, Ltd., £530.

The D.P. Battery Co. (Bakewell) have, during the [illegible] month, shipped two batteries to the Transvaal and one [illegible] to India, Siam, Queensland, Newfoundland, and Canada. They have also recently completed the replating of an [illegible] make of battery at the Charlotte Street sub-station of the Chelsea Electric Supply Co.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night was £59 15s. to £60 per ton (last week £60 to £60 5s.).

Motor Converters.—We referred briefly in our issue of October 20th (page 673) to a large order for motor converters for the Calcutta Electric Supply Corporation, which has been placed with Messrs. Bruce Peebles & Co. The order is for 16 Peebles motor converters (La Cour patents), each of 475 kw., running at 500 r.p.m., to convert from 6,000 to 6,600 volts, 3 phase, 50 cycles, to 450/550 volts continuous, or *vice versâ*, and they will supply a three-wire network. The tenders were originally invited for induction and synchronous motor generators, with permission to quote for rotary converters or motor converters as alternatives. The order was finally placed for motor converters at £25,000, a price little less than some of the offers for motor generators and rotary converters, on the advice of the Consulting Engineers, Messrs. Kennedy & Jenkin.

The I.E.E. Premiums.—We are informed that all the instruments presented as premiums at the Institution of Electrical Engineers on Thursday were made by Mr. R. W. Paul, Newton Avenue Works, New Southgate, London.

Plant for Sale.—The Edmonton Board of Guardians have for sale two 30-kw. generating sets, a 15-kw. D.C. dynamo, switchboard and instruments, 4 tons of battery plates and 100 cells, counter shafting, bells, arc lamps, 18-inch fans, &c. Particulars from Messrs. May & Hawes, Caxton House, Westminster, London. (See an advertisement on another page.)

Moncrieff, P. Ford & Co.—This firm has opened offices at 57 Colmore Row, Birmingham. In addition to handling their own specialities in engineers' small tools and hardening furnaces, they will specialise in gauges, micrometers, and temperature measuring apparatus. Mr. Ford was recently sales manager to Mr. S. N. Brayshaw (Manchester), and was at one time managing director of the Brooke Tool Manufacturing Co. (Birmingham).

Digitized by Google

APPOINTMENTS AND PERSONAL NOTES

Mr. J. P. Simpson has been elected secretary of the Newcastle branch of the Association of Mining Electrical Engineers, in place of Mr. H. J. Fisher, who has resigned.

Sir Charles Petrie has been re-appointed Chairman of the Liverpool Tramways & Electric Power Committee.

At a smoking concert of the Faraday House Old Students' Association next Friday, a presentation will be made to Mr. H. Foulds, late hon. sec. of the Association.

The Municipal Wiring Bill.—A Conference was held last Thursday between representatives of the Incorporated Municipal Electrical Association and the Electrical Contractors' Association (Incorporated). This Conference was held at the suggestion of the latter Association, with a view to seeing if a settlement could be arrived at of the disagreement of which the Municipal Wiring Bill is the outcome. The I.M.E.A. were represented by Mr. J. Christie (President), Mr. H. Faraday Proctor (Honorary Secretary), Alderman Pearson (Bristol) (Honorary Solicitor), Mr. A. H. Seabrook, and Mr. A. C. Cramb. The Electrical Contractors' Association were represented by Mr. Harland Bowden (President), Mr. Leonard G. Tate (Secretary), Mr. R. Tweedy Smith (Honorary Solicitor), Mr. J. McDermott (Past President) of Manchester, and Mr. Thomas Wright (Past President) of Glasgow. We are informed that the preliminaries were considered satisfactory to both sides, and the Conference was adjourned until December 8th.—In the meantime meetings are being held at various centres, at some of which the President and Secretary of the Electrical Contractors' Association attend, with the purpose of increasing the "fighting fund." We understand that guarantees amounting to nearly £2,000 have already been received. So far, about two-thirds of the country has been covered in this way, but Yorkshire and Newcastle have yet to be dealt with.

"The Central."—The October number of the magazine of the Old Students' Association of the City and Guilds of London Central Technical College opens with an article on Steel-making, by Professor H. C. Armstrong. Other miscellaneous subjects treated are rainfall, boiler management, and bird's-nest photography; an account is also given of the proceedings of the Engineering Section of the meeting of the British Association at Sheffield. Notes on the doings of old students of the College are also given, and reviews of a number of technical books are included. An excellent portrait of Professor W. J. Pope, F.R.S., forms the frontispiece.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Anglo-Portuguese Telephone Co.—Interim dividend at the rate of 3 per cent. per annum on ordinary shares.

British Insulated & Helsby Cables.—Subscriptions have been invited during the week for an issue of £200,000 of 5 per cent. mortgage debenture stock at par. The new stock is part of an authorised total of £500,000, and will be redeemable in 1925 at par, but the right is reserved to pay off the issue at any time after 1915 at a premium of 2½ per cent.

Robertson Electric Lamps.—A scheme for the reduction of the nominal capital of this company from £100,000 in 10,000 shares of £10 each to the value of £3 10s. each was sanctioned by Mr. Justice Neville in the Chancery Division last week. By this means, £43,875 will be returned to the shareholders. It was pointed out that the company has been an exceedingly prosperous one, and that the resolutions for the reduction have been unanimously passed and confirmed.

Craigpark Electric Cable Co.—Interim dividend on 6 per cent. preference shares for the half-year to September 30th.

Cleveland & Durham Electric Power Co.—At a special meeting on Monday resolutions for reducing the capital from £1,000,000 to £700,000 were passed.

Electricity and Fogs.—During the course of a lecture upon the electrification of crops at the Midland Institute on Monday, Sir Oliver Lodge said that if the Government would encourage universities in research and were wise enough to provide £100,000 a year for purposes of experiments, he would apply electricity not only to accelerating plant growth, but to the influence of weather, and the dispersal of fogs at harbour stations. He would not undertake to deal with town fogs, which, in his opinion, ought never be produced. But there were fogs over harbours which would be much better for electrical treatment.

Telegraph Traffic.—Telegraphic communication between Rome and Constantinople was restored on the 9th inst., and on the 11th inst. the cable between Bonny and Duala was also repaired. On the 12th inst. the Indo-European Telegraph Co.'s lines were interrupted between Berlin and Emden for a short while, and another part of the company's system between Odessa and Kertch failed on the 14th inst. The *via* Fao and Hanekin routes were down between Adana Alep and Angora Diarbekir on the same day, as well as the route *via* El Arich between Adana and Lattaguil. The two former routes were, however, restored on the 15th, leaving the last-mentioned line still interrupted.

OFFICIAL ANNOUNCEMENTS AND SMALL ADVERTISEMENTS.

Official Advertisements are charged at the rate of 9d. per line (column width).

Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of 1/- for the first 12 words and 1d. per word afterwards. Three insertions for the price of two. Advertisements can be received up till Wednesday morning first post.

Letters should be addressed to THE KILOWATT PUBLISHING CO., LTD., 203–6, Temple Chambers, London, E.C.

EDMONTON UNION.

ELECTRICAL PLANT AND SCRAP MATERIALS FOR SALE.

THE GUARDIANS of the EDMONTON UNION are prepared to receive offers for the following Plant and Scrap Materials which they have for disposal at the Edmonton Workhouse, Bridport Road, Upper Edmonton :—

Two 30-kw. High-Speed Engines and Direct-Current Dynamos.

One 15-kw. Direct-Current Dynamo.

One Switchboard and Instruments.

About four tons of Battery Plates and 100 Cells.

Counter Shafting, Belts, Arc Lamps, 18-in. Fan and Direct-Current Motor, Gas Meter, and Sundry Scrap Metal.

Further information may be obtained from Messrs. MAY & HAWES, Consulting Engineers of the Guardians, Caxton House, Westminster, and the Master of the Workhouse.

The Plant may be inspected at the Workhouse at all reasonable hours.

Offers for the whole or any part of the plant may be submitted and should be made to me by letter.

F. SHELTON,
Clerk to the Guardians.

Lower Tottenham.
November, 1910.

APPLICATIONS for Appointments effectively arranged, ensuring favourable consideration. Numerous unsolicited testimonials. Expert advice. Write now.—HERBERT GREATOREX, Beechwood, Matlock.

WANTED, a SET of First or Second Hand ACCUMULATORS for 26 lights for 100 volts, also a set for double this capacity.—Apply H. O. SHORT & SON, Berwick-on-Tweed.

GAS RETORT CARBON for Sale. Pitch, Insulating Material, Creosote. We supply the Trade.—V. DASNIERES, 10 St. Mary Axe, London, E.C.

C. JENNINGS & CO. can supply woodwork of any description at short notice, Stairs, Balusters, Newels, Handrails, Sash bars, Mouldings, Joinery. Support British Industry, and refuse Foreign doors. We compete. Electric casings and underground troughing also supplied. JENNINGS & Co., 955, PENNYWELL ROAD, BRISTOL.

SUMMARY

THE action for alleged libel against Sir John Benn by the G.B. Surface Contact Co. is still being heard in the King's Bench Division. Mr. B. H. Bedell was in the witness-box for four days, and detailed at great length the manner in which he alleged the officials of the L.C.C. Tramways Department altered his system, and so brought about its failure. He put the value of his patents at the time the London County Council took the system up at £100,000, but Mr. Griffiths, his co-proprietor in the patents, placed the figure at £250,000. Mr. Bedell said he was firm in the opinion that the Council's tramway staff were hostile to the use of the system. He also drew attention to the fact that when the Council placed half a mile of track in his hands for reconstruction after Mr. Mordey had reported, he adopted the system as laid down at Lincoln, and it worked perfectly satisfactorily. On Monday Mr. W. M. Mordey gave evidence, and said that he was unduly cautious in his first report on the system, and when he afterwards ran cars over the track reconstructed by Mr. Bedell, he obtained more satisfactory results than he had anticipated. A feature of the case has been the manner in which Mr. Justice Ridley has disagreed with the contention of Sir Edward Clarke that Sir John Benn's statements were comments upon the system as laid down in London, and not statements of fact in regard to the G.B. system wherever it was laid down. (Page 743.)

A LETTER from Mr. F. Broadbent calls attention to a method of connecting motor starters to allow a larger current to pass at starting than would blow the fuses on full load. (Page 744.)

FOLLOWING on last week's description of the Blackfriars generating station of the General Post Office, we give particulars of the sub-stations and the lighting and power supply in the different buildings. The new King Edward building is supplied with three-phase current for lighting, the load being balanced across the different phases. (Page 745.)

AN illustration is given of a lay-out of special points and crossings for a "car-fan" for Leeds, which is said to be the largest of its kind yet constructed in this country. (Page 747.)

THE electric clock under construction for the Royal Liver Building will be the largest electric clock in the world. (Page 748.)

AN article on aluminium *v.* copper cables for low-tension feeders and distributors reviews the whole question of the use of aluminium cables, comparing the cost of the cables themselves, describing experiments and tests on the best system of jointing, and giving particulars of the underground aluminium cables that are already being utilised in this country. (Page 749.)

SOME interesting information as to the difficulties met with in the electrical work in the Navy was given by Mr. C. H. Wordingham (Electrical Engineer-in-Chief to the Admiralty), in the course of an address to the students of the Institution of Electrical Engineers. (Page 751.)

WE give particulars of some of the Bills of electrical interest, of which notice has been given for the next session of Parliament. (Page 752.)

AMONG the specifications published by the Patent Office on Thursday last was one by L. Milne for a device to take the place of inspection boxes in conduit wiring systems. A hot-plate with the heating element enclosed between two metal plates is described by A. F. Berry. A patent by A. E. Angold relates to a method of relieving the abutment carbon in arc lamps of the stop pattern of the weight of the guiding parts. Three patents relating respectively to the manufacture of storage-battery plates, electric cranes, and wiring fittings, in which connections are made without cutting the cable, have been granted in spite of opposition. The grant of a patent to J. Keith for a roof ventilator for railway carriages is opposed. (Page 753.)

A MAJORITY of about 200 ratepayers are in favour of transferring the Acton electricity undertaking to the Metropolitan Electric Supply Co.—In consequence of

Digitized by Google

the Board of Trade decision regarding a winter service, the Scarborough Tramways Co. threaten to abandon the undertaking.—Mr. W. W. Lackie has introduced a new system of charging in Glasgow, whereby current for heating, cooking, &c., may be taken off the lighting circuits.—There is considerable opposition to the proposal of the L.C.C. to abandon the tramways in Liverpool Road, Islington.—Gloucester Corporation have rejected the proposal of the Electricity Committee that they should accept orders for electrical apparatus, &c., and pass them on to contractors on a commission basis. (Page 754.)

ADDITIONAL generating machinery is to be installed at Greenock, Leek, and Lowestoft.—Rotherham Corporation require high-tension feeders, rotary transformers, switchgear, &c.; Wigan Corporation require low-tension cable; and Birmingham Corporation, 60 tramcars.—Tenders are invited for the working of tramways in Constantinople. (Page 754.)

The Committee for the Protection of Electrical Interests.—This Committee has decided to hold a general meeting to discuss the advisability of undertakers under the Electric Lighting Acts being empowered to wire premises and supply apparatus for the consumption of electrical energy, on loan, or otherwise, on Wednesday, December 7th, at 8 p.m. This meeting will be open to all members of the electrical industry, and those who would like to take part are invited to send in their names to the Hon. Secretary, Mr. R. Borlase Matthews, Bank Buildings, Kingsway, W.C. By courtesy of the Council, the meeting will be held in the lecture theatre of the Institution of Electrical Engineers, Victoria Embankment, E.C. In the unavoidable absence of the President, the chair will be taken by the Vice-President, Mr. Robert Hammond. Arrangements have been made for those who would like to dine together before the meeting to do so at Gatti's Restaurant in the Strand. The price of the dinner is 3s. 6d., but no tickets will be issued. It would, however, he a convenience if those who purpose dining would let the Hon. Secretary know of their intention to do so. As the dinner is, of course, informal, ordinary dress will be worn.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 24TH.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. "Street Lighting by Modern Electric Lamps," by Haydn T. Harrison.

FRIDAY, NOVEMBER 25TH.

Physical Society.

5 p.m. At Imperial College of Science. (1) "The Electric Stress at which Ionisation begins in Air," by Dr. A. Russell. (2) "Exhibition of a Surface Brightness Photometer," by J. S. Dow.

Faraday House Old Students' Association.

8.30 p.m. Smoking Concert at Holborn Restaurant.

SATURDAY, NOVEMBER 26TH.

Association of Mining Electrical Engineers.

3.30 p.m. Notts and Derbyshire Branch, at University College, Nottingham. (1) Presidential Address to be further discussed. (2) "Inspection and Repair of Electrical Plant Underground," by R. R. Smith.

5 p.m. Yorkshire Branch, at Royal Victoria Hotel, Sheffield. Continuation of discussion *re* Examinations.

5.30 p.m. Warwickshire Branch, at Imperial Hotel, Birmingham. Business same as Notts Branch.

6.30 p.m. Lancashire Branch, at Grand Hotel, Manchester. Paper by R. R. Smith, as above.

MONDAY, NOVEMBER 28TH.

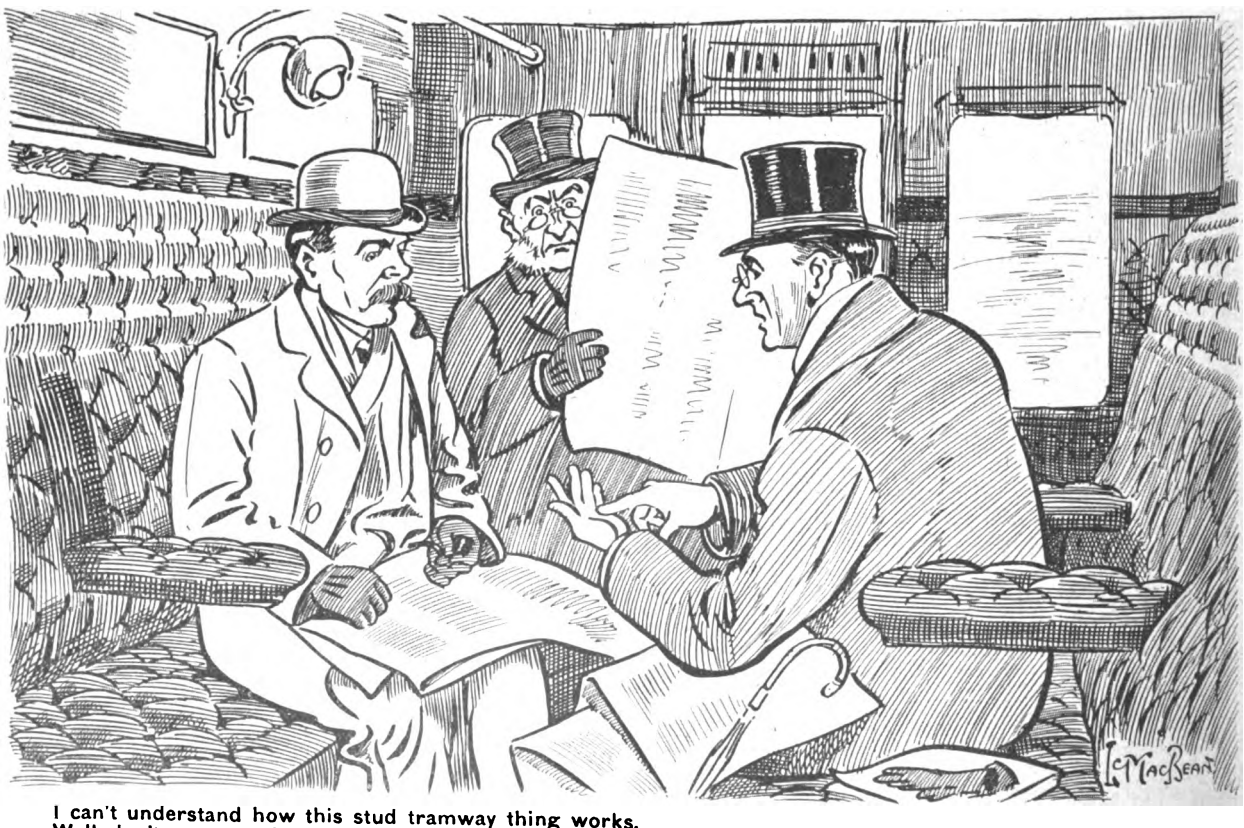
Royal Society of Arts.

8 p.m. Cantor Lecture II., on "Industrial Pyrometry," by C. R. Darling.

TUESDAY, NOVEMBER 29TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At Municipal School of Technology. "What's Wrong with the Electrical Industry, and How to Put it Right—on Paper," by H. A. Carney.



WEDNESDAY, NOVEMBER 30TH.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At Victoria Embankment. "Tramway Brakes and Brake Gear," by J. C. Rennie.

Wireless Telegraph Notes.—The Pacific Steam Navigation Co. have decided to fit all their mail steamers with a Marconi system.

The Spanish Government have signed a contract with Marconi's Wireless Telegraph Co. for the establishment of wireless telegraph stations in Madrid, Barcelona, Vigo, Cadiz, and the Canary Islands, among other places.

I can't understand how this stud tramway thing works.

Well, don't you see, when the car comes along this stud arrangement comes up and gives it a push and sends it on to the next; sort of jerks it along you know.

Yes, I see, but why do they call it the SURPLUS CONTRACT system?

Well, you see, they wouldn't let the inventors fix the things in the street themselves, but made a contract with some other Johnnies to do it, and they had to make another contract with the inventor Johnnies.

THE G.B. SYSTEM IN THE MILE END ROAD

THE action by Messrs. Griffiths and Bedell against Sir John Benn for libel in respect of certain statements made by him relating to the G.B. surface contact system during the time the London County Council was experimenting with this in the Mile End Road, has continued daily before Mr. Justice Ridley since our last issue. In our last report we dealt with Mr. F. E. Smith's opening speech. At the close of this, some discussion took place as to the issues in the case, and eventually Mr. Justice Ridley ruled that, as Sir John Benn's statements were stated as facts and not as matters of opinion, it devolved upon him to prove that the system was an "inefficient" and a "mischievous and impossible one." If, continued the judge, a man said the system was a "jerry-built" one, he stated it as a fact and not as a comment.

Mr. Stanley Clegg, electrical engineer and tramways manager, Lincoln, was the first witness called, but Sir Edward Clarke, for Sir John Benn, objected to evidence as to the satisfactory working of the system at Lincoln. It was, he said, irrelevant as to what happened in the Mile End Road. Mr. Justice Ridley, however, over-ruled the objection on the ground that the system had been described as a "mischievous and impossible one," and it was evidence if it could be shown that it was not such a system. He disagreed with Sir Edward Clarke in saying that Sir John Benn's statements applied to the system as laid down in London. In his opinion, Sir John Benn referred in general terms to the system, and his speeches went to show that the system was of no use wherever it was put down.

Mr. Clegg, giving evidence, said that the guarantees in respect of the three miles of G.B. system at Lincoln were: (1) The total current consumption per car mile should not exceed 1·3375 units. During the first twelve months it was 1·2 units, and last year 1·07 units. (2) That the current to excite magnets on the cars should not exceed 580 watts. This was only 260 watts in the first year. (3) Not more than 18 studs per annum should be left "alive" on the road unrecorded. No such studs had remained. (4) The collection of current must be steady and judged by the car lighting. This guarantee has been quite fulfilled.

Continuing, he said there had been no accidents to persons, and only one horse had received a shock, and that was before the system was in operation. There had been no live studs at Lincoln through surface leakage, and in his opinion the system should have been quite suitable for London if laid down as at Lincoln.

Mr. B. H. Bedell went in detail through the negotiations with the London County Council, which led up to the arrangement that a licence was to be granted for the use of the patents on the basis of £500 per mile of single track for the first 30 miles, £250 per mile until the royalties reached £20,000, and £150 per mile afterwards. Thus, if the total length of 200 miles, as was suggested at one time, had been constructed, the royalties would have amounted to £42,500. The agreement with the County Council, however, gave the G.B. Company no voice as to the manner in which the system should be designed. Dealing with some of the details in which, from the beginning, the Company had expressed their dissatisfaction in regard to the design adopted by the London County Council Tramways Department, he said that the access boxes were not air-tight, and that they admitted gas and water, and further, that the necessary blower for ventilation had been omitted. In many cases the metal-work of the boxes was in contact with the tie-bars of the rails, resulting in short circuits. The lids were not packed properly, and trouble was caused by reason of their height in the roadway. The sump pits, instead of being galvanised iron tanks as at Lincoln, were concrete, thus admitting gas, and, but for his complaint just prior to the first trials, cars would have been run without the conduit having been ventilated, and gas explosions must inevitably have arisen. It was for this reason that the Vacuum Cleaner Company brought into use one of their cleaners to draw the gas out through the lids of the access boxes. The design of the resistance studs was defective owing to Mr. Fell having provided him with wrong information as to the necessary current for starting the cars. These were designed for 60 amperes, but it should have been 100 amperes. These resistance studs are placed at cross-over roads, and similar special points, in order to limit the short circuit current through the collector making contact with the stud-head and the rail. The cars were unable to start on these studs, and the current being left on, the resistance fused, the molten metal establishing a permanent short circuit.

After describing a suggested improved stud by Mr. Fitzmaurice as ridiculous, Mr. Bedell criticised the design of the car equipments. One of the most important things which he complained of was the reduction in size of the outer pole of the magnet in order that it should not affect the existing track brake gear, the portion cut away being replaced by a piece of gunmetal. All the alterations in the car equipments were made by the order of Mr. Fell. The safety breaker for detecting live studs had never worked efficiently, and the weakness in the car magnet tended to leave live studs, because the knock-off action did not take place. Later Mr. Fell substituted a two-magnet equipment, which, if anything, was weaker than the single magnet equipment with the gunmetal pole tip. In fact, he thought weak magnets were the chief cause of live studs during the trial runs. The energy used for exciting the magnets was about three times that required by the single magnet at Lincoln.

It was quite true that during the first trials of the system, 927 studs are recorded as "live," but, as a matter of fact, over 800 of them became dead by their own action within a few seconds of the car having passed over them. Difficulties had arisen through the magnet and collector on the car picking up pieces of scrap metal on the roadway, but this could easily have been avoided had the magnet been protected, but no effort was made to do this.

Coming to the period when Mr. Mordey was called in to report upon the system, Mr. Bedell said that practically none of Mr. Mordey's suggestions were adopted upon the half-mile of track which was then experimented with, the system being almost identical with that at Lincoln. The result was that Mr. Mordey confidently recommended the Council to equip the whole route in the same manner. When he came to overhaul the track, he found that the carbon brush in the stud was too near the cable, and in order to get over that it was necessary to pack up the stud heads. Entirely new equipments were put on the cars, and although two magnets were used it was found that the car ran up to a speed of over 20 miles per hour with a single magnet. The safety breaker was adjusted, and it never failed during this later experimental period. Similarly the arc killing devices—his own resistance device, and Mr. Mordey's condenser—worked perfectly satisfactorily, and no live studs were recorded whilst these were in use. The new collector which Mr. Mordey in his report referred to with satisfaction, was precisely the same as the one at Lincoln. It was whilst these trials were being made that the incident referred to by Mr. Smith of the track being salted arose. Mr. Bedell, Mr. Griffiths, and Mr. Hird were returning home at 4 o'clock in the morning after trials, at which members of the Highways Committee had been present, and noticed one of the County Council's salting carts depositing salt in two ridges on either side of the studs inside the rails. The driver of the cart stated that he had been doing that work for nearly a month, and the salt had only been applied on the experimental half mile. As a matter of fact, Mr. Mordey, on being informed of this, expressed his satisfaction, although he had not been officially informed that it was being done, as it had made the conditions abnormally severe and the system had come through the trial satisfactorily. Nevertheless, the Highways Committee recommended that the system should not be further experimented with. Finally, Mr. Bedell stated that when the system was taken up by the London County Council, he valued his patents at £100,000, but at present they were absolutely valueless.

Cross-examined by Sir Edward Clarke, Mr. Bedell expressed the opinion that the Council's officials were opposed to this system, and that, in order to prevent its success, they had altered it. Asked to name individuals in this connection, Mr. Bedell referred to the staff generally, but specially mentioned Messrs. Fitzmaurice, Fell, Horn, and Hunter as being opposed to the system. He further expressed the opinion that political considerations had influenced the Highways Committee in their recommendation to abandon the system.

During the cross-examination discussion arose as to the admissibility of the Highways Committee's reports, and their bearing on the case as affecting the alleged libels by Sir John Benn. Once again Mr. Justice Ridley disagreed with Sir Edward Clarke, and said that anyone reading the Highways Committee's final report recommending that the system should not be persevered with, would not think it was the same system as that referred to by Sir John Benn.

In further cross-examination, Mr. Bedell admitted that he had supplied the majority of the materials for the system

Digitized by Google

as laid down by the London County Council, but they had all been supplied to the design of the Council's officials.

On Monday Sir Edward Clarke cross-examined Mr. Bedell at great length, both upon the technical details of the equipment and upon the alleged libels. He sought to show that the drawings for the access boxes, for instance, had been agreed to by Mr. Bedell, but correspondence was produced showing that they had been protested against. Sir Edward Clarke carried on this cross-examination in such detail and at such length, that eventually Mr. Justice Ridley expressed the opinion that it was carrying the matter no further, and that he was tired of it. Sir Edward Clarke then left the technical details for the moment, whilst Mr. Bedell went through the various statements, and pointed out what he considered to be unfair expressions and libellous statements, all of which were mentioned in the opening speech. The question of the design of the sump pits was then taken up, and Mr. Bedell insisted on saying that the arrangement for keeping them air-tight, used at Lincoln, was well known to the County Council's officials, but they would not adopt them. Further, the lids were not screwed down tight when they were first installed, with the result that the traffic stripped the threads of the screws.

Mr. Bedell's cross-examination was concluded on Tuesday. With reference to a patent which Mr. Mordey had taken out in connection with surface contact systems for an arc killing device, and which it was suggested was a material improvement on the G.B. system, Mr. Bedell said that it involved a principle which was already known to the G.B. Company, and that Mr. Mordey had offered to sell them this patent for £500. It was suggested, however, that if the patent were used by the Company, a royalty should be paid. Cross-examined as to the negotiations with the various Corporations already mentioned, he said that in every case they had fallen off after the first libels were published. At York, for instance, the councillors seemed convinced that there must be some truth in the statements, and it was only Mr. Hame, the City Electrical Engineer, who, as an engineer, understood the matter, and who was not misled by the malicious statements that were being circulated.

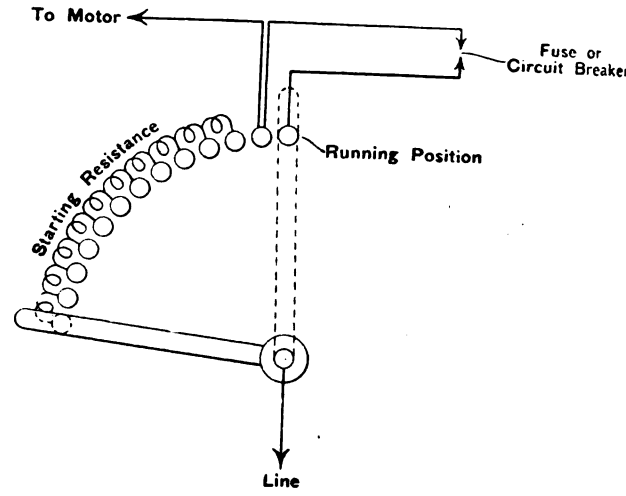
During this cross-examination yet another argument took place between Mr. Justice Ridley and Sir Edward Clarke. They seem to have been at cross purposes from the beginning. Sir Edward Clarke claimed that he was being forced to defend the officials of the London County Council, whose improper action had been said to have made the system inefficient. Both Mr. Fell and Mr. Fitzmaurice had had great experience in tramway matters, and were going to give evidence to say that in certain matters the system could be improved.

Mr. Justice Ridley said that it seemed to him that the person to make the system work was Mr. Bedell, but whether it was a good one or not remained to be seen. He was not attacking Mr. Fell or Mr. Fitzmaurice, but he thought that he himself would have preferred to trust the man who invented this very difficult system.

Mr. F. E. Smith said he was prepared to stand or fall by the statement that the G.B. system was an efficient one inefficiently laid down in London.

Sir Edward Clarke said his contention was that Sir John Benn had all through only been referring to the system as laid down in London.

Mr. William Griffiths, co-proprietor with Mr. Bedell of the G.B. patents, confirmed his evidence. He said that £15,000 had been spent in perfecting the system, and he claimed to recover this and a good deal more by the loss of business which there was every prospect of coming to the Company had the experiments in London not been libelled in the manner that they had. In his opinion, Messrs. Griffiths and Co. were not given the contract for laying the track in the Mile End Road owing to the spiteful attitude of Mr. Fitzmaurice towards himself. In cross-examination he denied that he was on the black list of the London County Council in connection with a previous contract. There was some trouble in connection with a contract in 1904, but since then he had carried out work for the Council and also supplied materials.



Mr. W. M. Mordey, who gave evidence on subpœna, corroborated the statements made in his reports to the London County Council that the G.B. system gave complete satisfaction after his experiments. When he made his first report he had not run any cars over the track, but later when he did so he found that he had been unduly cautious in his first report, and that the cars when run over the track worked even more satisfactorily than he had anticipated.

CORRESPONDENCE

STARTING OF INDUCTION MOTORS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Several interesting articles have recently appeared in ELECTRICAL ENGINEERING relating to the starting of induction motors, in particular one by Messrs. Moffett & Rosher, in the issue of September 22nd, 1910, which is the most interesting and instructive article I have recently seen on the subject. Several useful suggestions are made as to the method of protecting a motor against overloads and at the same time permitting the motor to take a heavy current, when starting, without blowing the fuse or bringing out the circuit-breaker. The use of a change-over switch which permits of the use of a heavy fuse during starting, and a lighter fuse when the motor has run up to speed, is probably the one most commonly adopted, but unless the switch is automatic and flies over to the running position on being released, there is always the risk that the switch will be left in the

starting position, when only the heavy fuse is in circuit. When rheostatic starting switches are used there is a simple method of getting over the difficulty, and as this is not mentioned in the article referred to, it may not be generally known.

From the point of view of the machinery insurance company it is the motor which needs protection rather than the cables leading to it. Any leakage or defect in the cable work rapidly develops into a short circuit, and therefore the cables may be more heavily fused than the motor which needs to be protected against say a 50 or 100 per cent. overload.

The simple method I refer to is to place the circuit-breaker or fuse between the last two contacts of the rheostatic starter, taking the motor connection from the contact next to the last, this being the last resistance contact. This fuse or circuit-breaker is not in circuit at all during starting, but only comes into action when the starter handle is pushed right over to the last stop, the starting resistance having in the meantime been all cut out, and the motor run up to full speed.

The rough diagram herewith will make the proposed arrangement quite clear. Only one circuit is shown in the diagram, but the method can, of course, be used either for single or polyphase motors, or to direct-current motors which have to start against excessive torques.

Yours faithfully,

FRANK BROADBENT.

4 Queen Street Place, E.C.
November 15th, 1910.

ELECTRIC LIGHT AND POWER IN THE POST OFFICE

A DESCRIPTION of the new generating station erected for the lighting and power supply of the main Post Office buildings in London was given in our last issue. Six main feeders from this station supply three-phase current at 6,600 volts, 50 cycles, to three sub-stations at G.P.O. South, G.P.O. West, and King Edward Building respectively. Two cables run direct to each sub-station, while interconnecting cables are also provided. They are three-core, paper-insulated, lead-covered cables, 0·5 sq. in. section per core, and are provided with an earth shield of copper strip directly under the lead. The insulation thickness is 0·23 in. between cores and also between cores and copper sheath, as the system is required to work with an unearthed neutral. Standard 3½ in. P.O. duct is employed except over Blackfriars Bridge, where the cable is armoured and drawn into iron pipes. The lead and armouring are bonded to earth plates on each side of the bridge.

The sub-stations at King Edward Building and G.P.O. South contain only transformers and the necessary switchgear, but at the G.P.O. West station there are motor converters and a battery. Arrangements are provided for enabling the battery, in the event of an interruption of the A.C. supply, to maintain not only the D.C. supply but also the A.C. supply for a considerable time by running the motor converters reversed.

The G.P.O. West sub-station, illustrated in Fig. 1, is interesting on account of the special arrangement of the switchgear, rendered necessary by the shape and small size of the room available. The H.T. switchgear was supplied by the British Thomson-Houston Co., and is worked on the mechanical remote control system. Fig. 2 illustrates the connections for a feeder, a motor-converter, and the 'bus-bar switch. Each feeder or motor cable terminates, as shown, in a sealing and dividing box, from which bare copper conductors are led through porcelain insulators which project into the cellwork to the switchgear and 'bus-bars. There are no shields between phases, but ample clearance is maintained. The static dischargers on the motor-converter circuits are the only ones provided throughout the system. To lessen the shock to the motor windings on switching on, water charging-resistances are provided. These are connected to auxiliary contacts on the main oil switches. Each of the four Peebles-la Cour converters is rated at 300 kw. with an overload capacity of 25 per cent. for two hours. They supply a 220-volt D.C. three-wire system, the middle wire of which can be connected to the winding of each machine for balancing. The E.P.S. battery is divided into two halves, each connected to one side of the system through an E.C.C. 40 kw. reversible booster, which enables either half to be charged or discharged without affecting the voltage of the system. Each half consists of 55 cells, weighing about 17 cwt. each, and the whole has a capacity of 2,000 ampere-hours on the one hour rating. Each booster will give 1,000 amperes up to 40 volts for charging, or 3,000 amperes up to 13 volts for discharging. The booster-motor overload circuit-breaker is interlocked with the booster switch, so that the booster and booster field are short-circuited if the breaker comes out. Aluminium 'bus-bars and connections are employed for the battery plant. Interconnecting D.C. feeders are provided between the three sub-stations for supplying continuous current for the batteries, lifts, and fans from this sub-station. Electrically-driven reciprocating air-pumps with a total capacity of 500 h.p. are being installed at G.P.O. West for supplying the pneumatic service which comprises several miles of tubes radiating out from here to the Vere Street and other chief post offices.

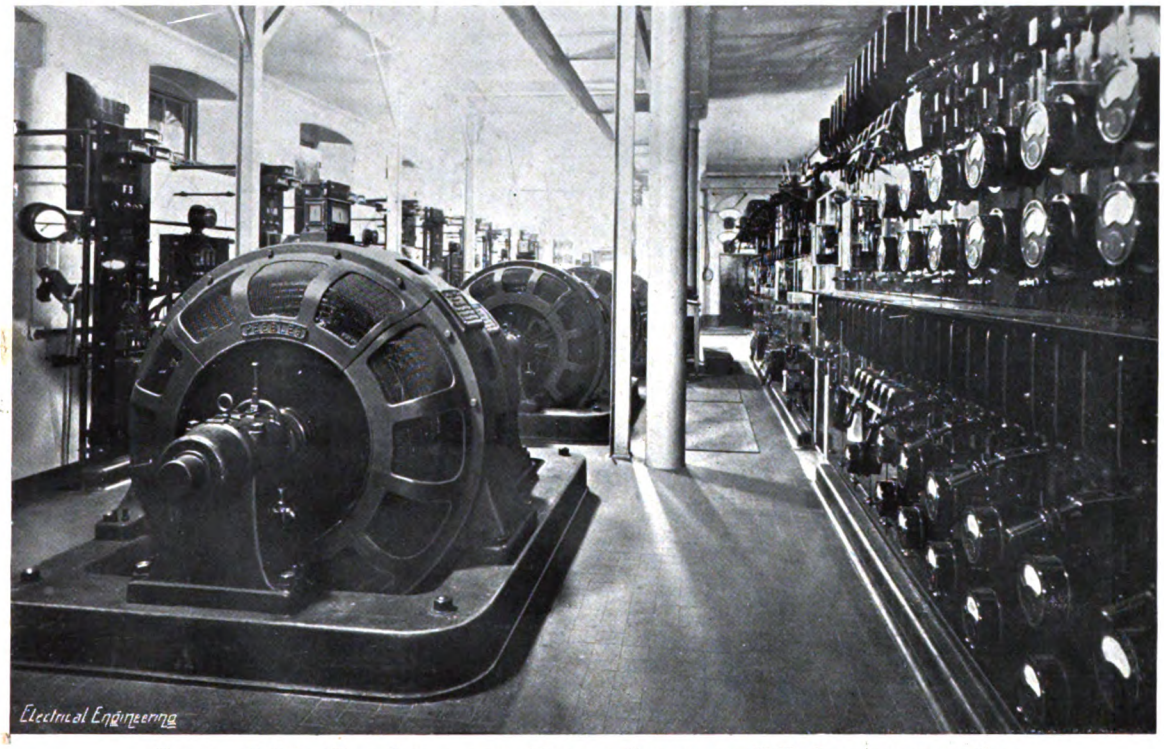

FIG. 1.—G.P.O. WEST SUB-STATION: CONTROL BOARDS FOR H.T. SWITCHGEAR ON LEFT.

The G.P.O. South sub-station is an A.C. station only, and consists of two sets of three air-cooled Berry single-phase transformers, with a capacity of 300 k.v.a. per set, connected in delta on both sides, and transforming down to 110 volts. They are connected by bare copper conductors supported on insulators, and are protected on both sides by switches fitted with overload relays.

At the new King Edward building, the sub-station contains four sets of three Berry transformers, con-

Digitized by Google

nected in delta on both sides. Two sets are rated at 300 k.v.a., and transform down to 440 volts for power, while the other two sets have each a capacity of 150 k.v.a., and supply the lighting and small motor circuits at 110 volts three-phase. The wiring system is unique, the method of balancing the load being of particular interest. A ferro-concrete cable trench running right round the building under the basement floor connects the sub-station with thirty vertical chases in the outer ferro-concrete walls, which extend right up to the top of the building. Some twenty lead-covered, paper-insulated, three-core cables of from 0·125 to 0·35 section per core, are laid in this trench, and lead up through the chases to ten main distributing boards, two on each main floor, and one only on some of the upper floors. Each board is supplied by two cables, and either is large enough to carry the whole load of about 50 amperes. These boards are for the purpose of distributing the load equally across the three phases. Two bare wires from the like phases of each cable are brought up from the trifurcating boxes under the board to a phase 'bus-bar inside. The three bars corresponding to the three phases are arranged side by side, and

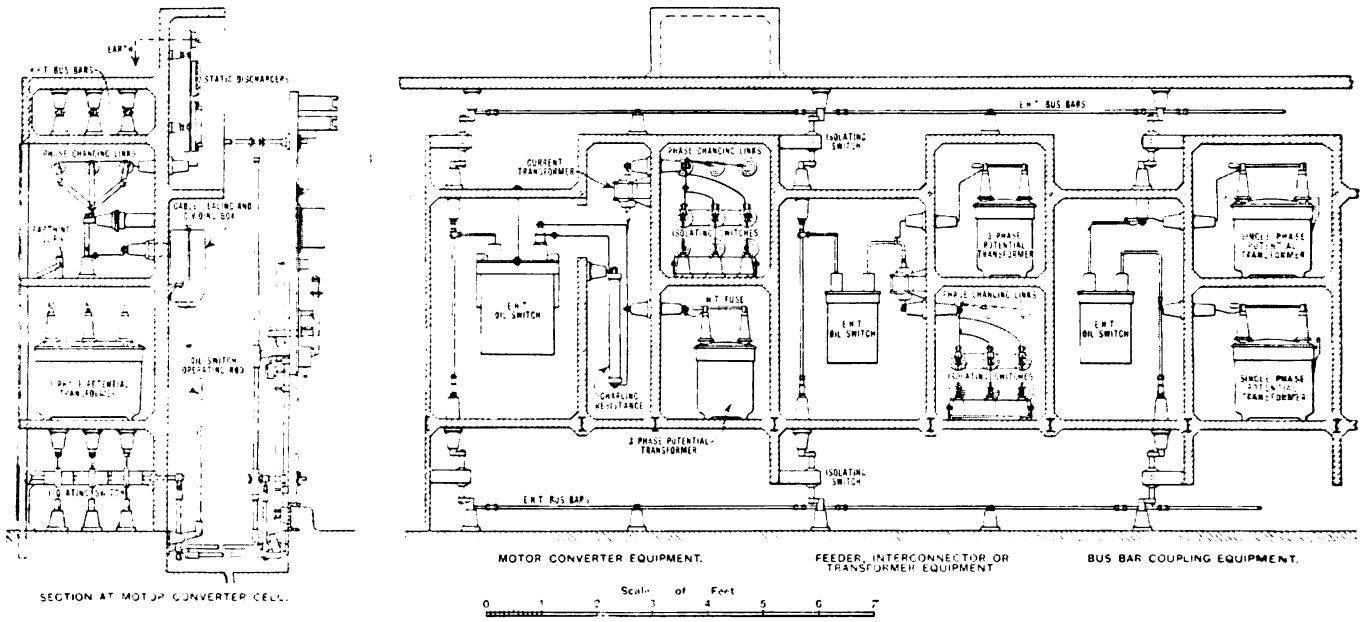

FIG. 2.—ARRANGEMENT OF H.T. SWITCHGEAR AT G.P.O. WEST SUB-STATION.

the hinge terminals of the switches for the nine or ten distribution board circuits are placed between the rows so that by switching them over to one phase or the other any circuit can be placed across any two phases. The circuits are thus connected *across* the phases, and not between one or other of the phases and a common neutral, as erroneously stated in a contemporary last week. To balance the load, ammeters are plugged in and the switches adjusted until the loads on the three sides of the system are equal.

Each balancing board supplies nine or ten distributing fuse boards controlling from eight to twelve five-ampere ways. There are 96 distributing boards, all of which are ironclad. These are connected to the balancing-boards on the same floor by lead-covered, paper-insulated single-core cables, either 19/16s or 19/18s, run in a 12-in. metal troughing erected round each floor. Sealing boxes are, of course, provided at both ends of all these cables. From the distributing boards, V.I.R. cables are carried in short lengths of conduit placed in chases in the wall up to the ceiling level, from which points they run in wood casing fixed along the beams supporting the arched ceiling. From various ceiling roses along this casing twin flexible is carried over hooks in the ceiling fixed at the points where the lamps are required to be suspended. Metal filament lamps are employed, arranged in groups of four in suitable fittings. On the ground floor alone there are 145 groups of four 100-c.p. lamps. In all there are 1,484 100-c.p. lamps, 493 50-c.p., 110 25-c.p., and 2,384 16-c.p. metal filament lamps, while 61 8-c.p. carbon filament lamps are also in use. Besides these, there are eighteen "Excello" flame lamps for the courtyard and exterior lighting. In the sorting offices an illumination of from two to three candle-foot is provided, and from one to two candle-foot where purely clerical work is done.

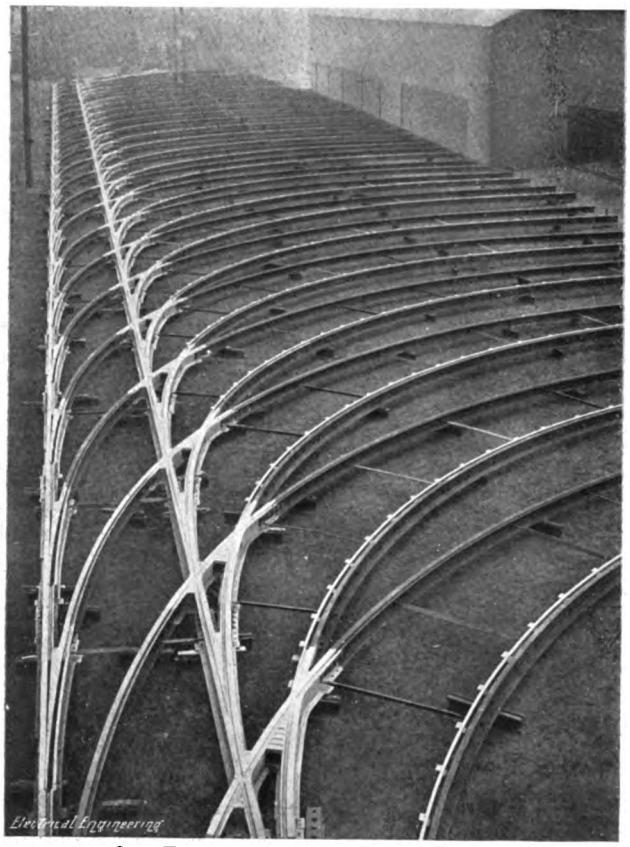
In order to ensure efficient earthing of all the ironclad boards, motors, &c., four earth plates are buried under the sub-station. These are connected to a copper strip 1 in. by ⅛ in., which runs the whole length of the trench under the basement, and from which bare copper 7/16 stranded wires run up all the vertical chases to connect with the boards, &c. The wiring installation was carried out by G. E. Taylor & Co.

The main features of the power plant are summarised below:—

There are thirteen electric lifts for goods or passengers, supplied by Messrs. R. Waygood & Co., and mostly operated from switches in the cars. The nominal loads range from 5 tons downwards, the average being 30 cwt., with a normal speed of 200 feet per min. The motors are supplied with three-phase current at 440 volts, but the controllers are worked by direct current. The D.C. controllers consist of two reversing solenoids, one solenoid controlling the main switch, and one starting rheostat solenoid. An interlocking switch, worked by the three-phase supply, breaks the D.C. control circuit on the failure of the A.C. supply.

A large number of fans driven by variable-speed D.C. motors are employed to blow air through ducts to each floor separately. Four large band conveyers for mail bags, one ropeway with wooden box carriers for letters, and six small band conveyers for letters are installed. Each is driven by a three-phase motor through belt and chain reduction gear, and controlled by an automatic starter comprising a single-phase motor, which gradually cuts out the rotor resistance. Trip gear operated off the D.C. supply enables the conveyers to be stopped by pressing small push-buttons provided at several points.

Mention should be made of the electric clock system installed by the Magneta Time Co., Ltd. A master clock, which acts as a generator to supply current at stated intervals to the several hundred dials which are all connected in series, is installed in a small room by itself. It is large enough to supply 900 twelve-inch dials. This clock is not synchronised from Greenwich, and has to be wound by hand every 50 hours. There are no batteries, and as the impulses are generated by induction, there are no contacts. We understand that in no other building in the world are there as many dials controlled from one master clock.



We are indebted to Mr. H. C. Gunton, Engineer to the Power Department, and to Mr. H. V. Cornish, Assistant Superintendent Engineer, for the information contained in this article.

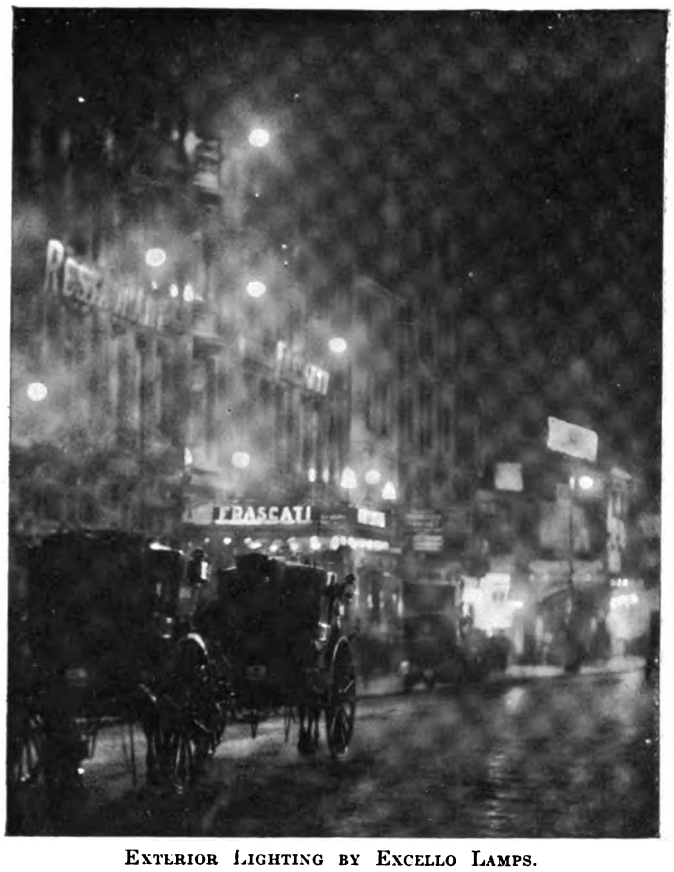
A LARGE CAR FAN

THE accompanying illustration represents a very large car fan constructed by the firm of Messrs. Edgar Allen & Co., Ltd., at their Imperial Steel Works, Tinsley, Sheffield, for the renewal of the car tracks in the Kirkstall Road Depôt of the Leeds City tramways. This is, we believe, the largest piece of work of this class that has been hitherto constructed in one lay-out in England, and, as constructed at Messrs. Allen's works, measured 346 ft. by 48 ft. wide.

The whole of the points on the main track couple together without intervening rails, thus reducing the number of joints. All the points are 75 ft. radius centre track. The left-hand points are all movables, the right-hand side consisting of compound open points and crossings cast in one piece, and repeated throughout, thus standardising the work. All curves off the main track are 35 ft. radius, spiralised to suit the varying distances of the pits in the depôt, thus standardising the castings as far as possible. All the curved tracks are fitted on the inside rail with Holt's patent guard rail—over



LAY-OUT OF CAR FAN FOR KIRKSTALL ROAD CAR DEPÔT, LEEDS.

1,200 feet being required—which has been rolled in 20 ft. lengths by Messrs. Edgar Allen & Co., Ltd., and being rolled to a miniature type of a bull-head rail, is consequently reversible, thus doubling the life of the guard. Messrs. Edgar Allen & Co., Ltd., have secured the sole right of supplying this guard rail, for which a great demand is expected. Our photograph clearly shows this guard rail in position. Special cast steel fishplates have been fitted to the castings at the places to which the guard connects. The total weight of the lay-out is approximately 85 tons, the points and crossings comprising over one-third of the total weight. The rails used were rolled by Messrs. Walter Scott, Ltd., of Leeds, to the new section adopted by the Leeds City Tramways, 105 lbs. per yard. The plans of the lay-out were prepared by Mr. J. B. Hamilton, general manager, and Mr. R. B. Holt, permanent way engineer, of the Leeds City Tramways, who inspected the lay-out before despatch.

Proposed Optical Convention in 1912.—The committee formed at the Optical Convention of 1905 appointed an Executive Committee, which has been ascertaining the views of those interested as to the holding of another Convention in 1912. As a result of the favourable replies received, a meeting of the full committee is to be held on Tuesday next at the rooms of the Chemical Society, Burlington House, under the chairmanship of Dr. R. T. Glazebrook (Director of the National Physical Laboratory). All interested are invited to attend.

EXCELLO LAMPS

THE Union Electric Co. (Park Street, Southwark, S.E.) have brought out a booklet with the attractive title, "Why the Excello Excels." This contains an interesting account of the development of the flame arc lamp and the way in which defects were overcome in the Excello designs. Attention is drawn particularly to the even burning of the carbons, which are designed specially for these lamps, the

EXTERIOR LIGHTING BY EXCELLO LAMPS.

form of the economiser, the ventilation arrangements, and way in which deposit on the globes is avoided. Some excellent illustrations, one of which is reproduced here, show these lamps in actual use. These are from untouched photographs taken at night by the light of the lamps themselves. Illustrations of the distinguishing features of the lamp are also given. The company will be glad to send a copy of this list to anyone who applies to them mentioning this notice.

Fencing Machinery.—At the Woolwich Police Court last week the Western Electric Co., Ltd., were summoned for not securely fencing the stamp of a power press as required by the Factory Acts. Mr. W. Williams, one of His Majesty's Inspectors of Factories, stated that he had sent notices to the company during the past two years respecting machines which had been the causes of several accidents. Last autumn a boy had the top of two of his fingers cut off by one of the presses. Some time ago the company had written him stating that they were experimenting with various guards, and they again made the same excuse for not fitting them. The company admitted the offence, and the magistrate adjourned the summons for 14 days in order that guards should be fitted in the meantime.

Institution of Electrical Engineers—Birmingham Local Section.—The opening meeting of the section was held at Birmingham University on Wednesday, the 16th inst. Mr. R. K. Morcom presided, and introduced the new chairman, Mr. M. Railing, in whose favour he vacated the chair. A vote of thanks to the retiring chairman was proposed by Mr. A. M. Taylor (Birmingham Electric Supply Department), and seconded by Mr. J. P. Kemp (Birmingham Electric Supply Department), and briefly acknowledged by Mr. Morcom. Mr. Railing then proceeded to read his address, of which an abstract was given in our last issue, and a vote of thanks was moved to him by Colonel Lister (Veritys, Ltd.), and seconded by Mr. J. H. Barker (Birmingham Metal and Munitions Co.). The meeting then adjourned at the invitation of Mr. Railing to the Grand Hotel, where an informal conversazione took place, music being provided by the band of the General Electric Co.

THE LARGEST ELECTRIC CLOCK IN THE WORLD

MESSRS. GENT & CO., LTD. (Faraday Works, Leicester), have under construction what will be when complete the largest electric clock in the world. The face of each dial will be no less than 25 ft. in diameter, and the happy thought occurred to the makers to use one of the dial frames as a round table at which, like King Arthur's knights of old, a company of invited guests partook of an excellent lunch in the Free Trades' Hall, Leicester. A photograph of the scene is reproduced here.

The clock in question is destined for the new Royal Liver Building, Liverpool, and will occupy a position about 220 ft. from the ground. It possesses four dials, each of which measures 25 ft. in diameter, and the minute hands measure 14 ft. long, and 3 ft. at their greatest width. Each of the huge hands is made of copper, with a 9 in. gun-metal backbone; it has been necessary to construct the opal face to withstand a wind pressure of over eleven tons. The outer circle of the dial is being constructed in 12 sections, each section measuring 6 ft. 3 ins., by 5 ft. 6 ins., and the spaces of 5 minutes each weighing 5½ cwt. The total weight of the frame work of each dial is 3½ tons, and no less than 5 cwt. of opal glass is used for each of the four dials. A special translucent opal glass will be used which, although only ⅛ inch in thickness, has been shown on test to be capable of withstanding a pressure of 600 lbs. per sq. ft. without breaking. The hours are indicated by twelve distinctive marks, instead of the usual Roman characters; each of these marks measures 3 feet by 1 foot 6 inches; and 1 foot 2 inches separates the minute marks.

The clock is worked on what is known as the "waiting train system" developed by Messrs. Gent & Co. The hands will not move forward in half-minute impulses as one is accustomed to see with ordinary electric clocks, but with a practically continuous motion, and will be governed by a special time transmitter. The "waiting train" system involves the use of a reciprocating slow-speed motor, the duty of which is to rotate the hands only, the timekeeping being effected by the time transmitter, which brings the movement under control at each half-minute. One of the advantages of this system is entire disassociation of the timekeeping element of the clock from the hand-driving element, with the very desirable result that the effect of the weather on the hands cannot react on the timekeeping, as is often found to occur with the ordinary mechanical clock. Another advantage of the system referred to is that a number of smaller clocks can be distributed throughout adjoining premises, and be driven from the same transmitter, the whole keeping the same good time. The transmitter will be connected through the G.P.O. wires to Greenwich, and will become automatically corrected when necessary, with the result that the clocks will indicate Greenwich mean time.

The dials of the large clock will be electrically illuminated, and a very ingenious switching apparatus is being made, which will automatically switch on the light at dusk and switch it off at dawn, making due allowance for the seasons, with an accuracy of 10 minutes in 30 years.

LUNCH PARTY ROUND THE FACE OF AN ELECTRIC CLOCK.

After lunch an inspection was made of the various portions of the clock in process of manufacture at the works, and we are informed that in the evening the staff of Messrs. Gent & Co. held a soirée round the clock face.

HOLOPHANE LIGHTING

WE reproduce here a photograph of the main entrance hall and corridors at the Newport Technical Institute, in which Tantalum Holophane "Arcs" and holophane spheres are installed. The even illumination effect obtained by these fittings, is not unlike that from an inverted arc lamp, but without the unsteadiness and flickering to which an arc lamp is liable. In addition to their use for the general lighting of the hall and corridors, this system of lighting has been adopted also in the art class-rooms, where it is desired to eliminate sharp shadows as much as possible. The quality of the light produced is also a great improvement on that from carbon lamps from the point of view of the discernment of colours. Messrs. Siemens Brothers' Dynamo Works, Limited (Tyssen Street, Dalston, London, N.E.), to whom we are indebted for this block, specialise in this particular type of fitting, and we understand that they can submit very promptly numerous designs of other holophane fittings which are equally effective.

LIGHTING BY TANTALUM LAMPS IN HOLOPHANE GLOBES AT NEWPORT TECHNICAL INSTITUTE.

The Royal Institution.—The Christmas course of experimentally illustrated lectures adapted to a juvenile auditory will be delivered by Prof. Silvanus P. Thompson on December 29th and 31st, and January 3rd, 5th, 7th, and 10th. The subject will be "Sound, Musical and Non-Musical."

Instantaneous Radiography.—An intensifying device for X-ray photography, known as the "Sunic" screen, has been introduced by Messrs. W. Watson & Sons, Ltd. (313 High Holborn, London). It consists of a thin card on which is a film of a patent emulsion, and is placed in the photographic slide so that this film is next to the film of the plate. It appears that the X-rays impinging on the patent film are absorbed, and highly chemically active, but invisible, rays emitted, with the result that only about one-twentieth of the exposure is required. It also appears that the density of the photograph is directly proportional to the time of exposure with these secondary rays. The film has an exceedingly fine grain, and the photographs obtained are said to be as sharply defined as in the case of those taken without the screen, but with twenty times the exposure.

ALUMINIUM v. COPPER CABLES FOR LOW-TENSION FEEDERS AND DISTRIBUTORS ON UNDERGROUND NETWORKS *

By F. C. Raphael and J. B. Sparks

AT the present prices of aluminium and copper, it is possible to buy insulated aluminium cables cheaper than copper cables. Moreover, copper is now at a very low price—about £60 per ton—and a rise in the market value during the coming year is by no means unexpected, so that the question of using aluminium cables in place of copper is worthy of some detailed consideration.

Before dealing with the practical details in the employment of aluminium cables, which it is the main object of this article to discuss, the actual position as regards relative price must be made clear. The authors hasten to disclaim having made any new discovery in this respect. Eighteen months ago, Mr. E. M. Hollingsworth (Borough Electrical Engineer of St. Helens) pointed out, in a Paper read before the Incorporated Municipal Electrical Association, that, at the prices then prevailing, single-core aluminium cables with the current-carrying capacity and resistance of copper cables from 0·05 sq. in. upwards, were considerably cheaper than copper cables; he did not go deeply into the subject, however, as his purpose was mainly to raise a discussion on existing practice.

Within a fairly close degree of approximation, the conductivity of aluminium is three-fifths that of copper, so that an aluminium conductor of 0·5 sq. in. section will take the place of a 0·3 sq. in. copper conductor. The corresponding aluminium conductor is, however, much lighter, and, as the cost of aluminium per lb. is not very much greater than that of copper, the aluminium cable in its uninsulated state is far cheaper. The larger amount of insulation and lead necessary to cover the larger diameter to the same radial thickness diminishes the advantage, but the fact remains, as stated, that for cable above a certain size aluminium is cheaper. We have, for the time being, confined our investigation as to price to single-core, low-tension cables; with triple concentric, three-core, and also high-tension cables, the time is not ripe to substitute aluminium, but with ordinary unarmoured low-tension concentric cables there still appears to be some advantage. It must not be forgotten, however, that so far as the present types of cable with copper conductors are concerned, there is no great difference between the cost of three single cables and triple concentric and three-core cables if they are not armoured.

Taking paper-insulated lead-covered cable first, we will refrain from quoting actual prices, as it would be unwise to do so in the present state of the cable market; we will content ourselves with recommending cable users to obtain alternative prices when buying cable of 0·1 sq. in. upwards. As was recently reported in ELECTRICAL ENGINEERING (October 13th, 1910, p. 654), the Manchester Corporation has ordered a large quantity of 1·66 sq. in. aluminium cable (equivalent to 1 sq. in. copper), the Bolton Corporation have cable of similar size in use, and at least one supply company and one other municipal electricity works have made the experiment of buying smaller sizes. At our suggestion the British Aluminium Co., Ltd., have worked out the various sizes of aluminium cables corresponding to the standard copper sizes, and we quote some of the sizes, adding the diameter of the finished lead-covered cable. The radial thicknesses taken are those of the Engineering Standards Committee for the larger section, that is to say, for instance, in the case of 1 sq. in. aluminium equivalent to 0·6 sq. in. copper, the radial thicknesses that would be employed for 1 sq. in. copper are assumed. For aluminium conductors larger than 1 sq. in. we have assumed radial thickness as for 1 sq. in.

* Strictly Copyright.

Dimensions of Lead-Covered Paper-Insulated Aluminium Cables.

Nominal Copper Section (sq. in.)	External Diameter of Lead-covered Copper Cable (in.)	Equivalent aluminium Cable [Number and Size of Wires (in. diam.)]	Diameter of Aluminium Conductor (in.)	External Diameter of Lead-covered Aluminium Cable (in.)
0·1	0·75	19/·105	0·525	0·865
0·15	0·86	37/·092	0·644	1·024
0·25	1·04	61/·093	0·828	1·228
0·3	1·11	61/·102	0·918	1·318
0·4	1·25	91/·096	1·056	1·496
0·5	1·33	91/·108	1·188	1·668
0·75	1·57	127/·112	1·456	1·956
1·00	1·82	127/·129	1·670	2·170

For vulcanised bitumen cable, we are able to give actual prices quoted by a British cable works, on the basis of copper at £60 per ton (electrolytic wire bars c.i.f. port of arrival)—which is equivalent to drawn copper wire at 7¾d. per lb.—and aluminium wire at 10d. per lb. at the cable works. The prices given for the cable are actual net selling prices, for cable delivered in the United Kingdom. The radial thicknesses of insulation are, of course, larger than for paper cables.

Prices of Bitumen Insulated Copper and Aluminium Cables.

Nominal Copper Section (sq. in.)	Copper Cable per mile. £	Corresponding Size of Aluminium Cable.	Aluminium Cable per mile. £
0·025	51	7/·087	44
0·05	87	19/·074	70
0·150	200	37/·092	155
0·250	287	61/·093	240
0·300	315	61/·102	255
0·400	440	91/·096	350
0·500	550	91/·108	440
0·700	740	127/·108	640
0·750	780	127/·112	650
1·000	1110	127/·129	900

It is clear, therefore, that for ordinary vulcanised bitumen cables for laying on the solid system, aluminium is considerably cheaper in all sizes; in fact, the difference is so great that aluminium will also be cheaper for armoured cables. For shaft cables in mines aluminium will therefore be cheaper also, but it must be pointed out that, in the case of armoured cables, it will not be lighter, as the extra weight of armouring on the larger-diameter cable more than compensates for the lighter conductor.

We will now turn to the question of laying and jointing, and the application of aluminium cable in the various systems. The question of jointing and connecting to the cable is one of great importance if aluminium is to be employed for distributors. It is less important in the case of feeders, but even then the end connections have to be considered. Although solders for aluminium have been invented from time to time, we prefer to assume that the jointing of aluminium cable either by soldering or welding, is not a suitable process for general use in service joints on distributing networks. In welding the intense heat that is necessary implies a grave risk of damaging the insulation, and we believe we are right in saying that none of the solders can be employed, as with a copper conductor, to pour through the wires, and to sweat them into a solid conducting mass.

Aluminium, when exposed to the atmosphere, becomes coated with a thin film of non-conducting oxide, and we have, therefore, carried out a number of experiments to ascertain whether the resistance and mechanical strength of this film is so great as to prevent the employment of ordinary clamped joints. Obviously, if the skin resistance is high and cannot be broken down by mechanical pressure, aluminium cables will not be suitable to use as distributors on

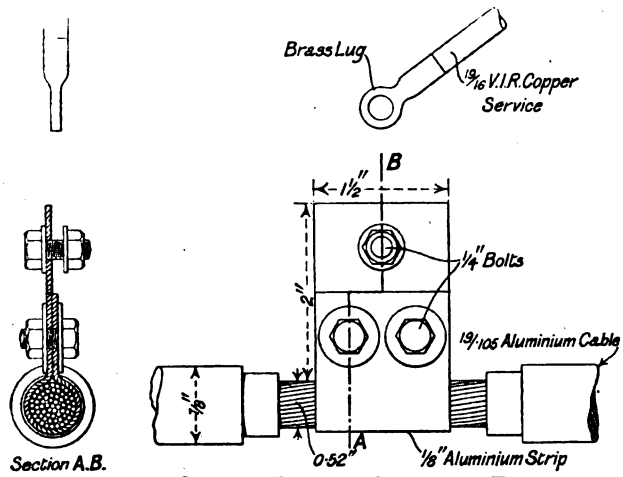

FIG. 1.—SERVICE CLAMP EMPLOYED AT EALING.

underground networks in the same manner as copper cables, as, if the service cables are simply connected to the conductors by clamps in the ordinary way, it would only be the outer layer of the stranded cable which would carry the current. Our experiments have shown, however, that the effect of the skin resistance of aluminium has been over-estimated in the past, and that for ordinary service connections, mechanical aluminium clamps similar to the brass clamps used in standard joint-boxes, can be employed for aluminium cables without any risk of connection not being made with the inner strands. It is important that the clamps should be screwed up rather firmer than usual so as to break down mechanically the insulating film on the outer strands, and to squeeze out the oil or other foreign matter which may have run between the individual strands and layers. A fairly good contact is then obtained right through, probably as good as the connections that would be made in a similar manner to a copper cable without sweating the strands together. In concentric cable it is advisable to place a thin metal sleeve on the insulation beneath the outer conductor, in order that the latter shall not cut into the insulation when tightening up the clamp.

The experiments referred to were made on a pair of aluminium distributing cables laid by Mr. J. Douglas Knight, Engineer and Manager of the Ealing Electricity Department.

They were single-core, paper-insulated, lead-covered 19/·105, equivalent to 19/14 copper, and their length was 1,869 feet each. The aluminium cables are provided at both ends with aluminium lugs cast round the end of the cable by running molten aluminium into a cast-iron mould into which the bared end of the cable has been inserted. It has been proved (by cutting through) that during this operation the cable end fuses, establishing an intimate contact between the lug and all the strands of the cable, so that it may be expected that a resistance measurement taken through these lugs will give the true resistance of the cable. There is only one service on this distributor, consisting of copper cables connected to the aluminium cable by a very simple form of clamp made from aluminium strip, as illustrated in Fig. 1; the joint was in a wooden box filled with compound, and the service had been in use for nine months. The distributor was first short-circuited at the far end, and the resistance of the total length was measured with the service cables disconnected from the clamps, so that the resistance corresponding to the distance from one end of the distributor to the service could be deduced. This agreed within 2 per cent. with the listed resistance of the cable. The far ends of the cable were then taken apart, and the two clamps for the service connection were short-circuited by a piece of stout copper wire. The resistance was then measured, and it was found that it only exceeded the resistance calculated from the previous test by 0·004 ohm, which showed that not only was the contact resistance of the clamp inappreciable, but that sufficiently good contact was established right through to the inner layers of the stranded cable.

The test was made by measuring the fall of potential (with a milli-voltmeter kindly lent us by Messrs. Everett, Edgcumbe & Co.), when a current was passing through the cable, and it was repeated with four currents from 8·9 to 16·1 amperes, all of which were measured with a Kelvin balance. The milli-voltmeter was recalibrated after the test and found accurate.

This figure of 0·004 represents not only the resistance of the two clamps, but also any additional resistance that may be introduced through the clamp not forcing all the layers of the cable into perfect contact.

In order to ascertain what proportion of the whole resistance was represented by the clamp joint itself, the milli-voltmeter was connected to the outside of the two cables just inside the clamps, so that the drop

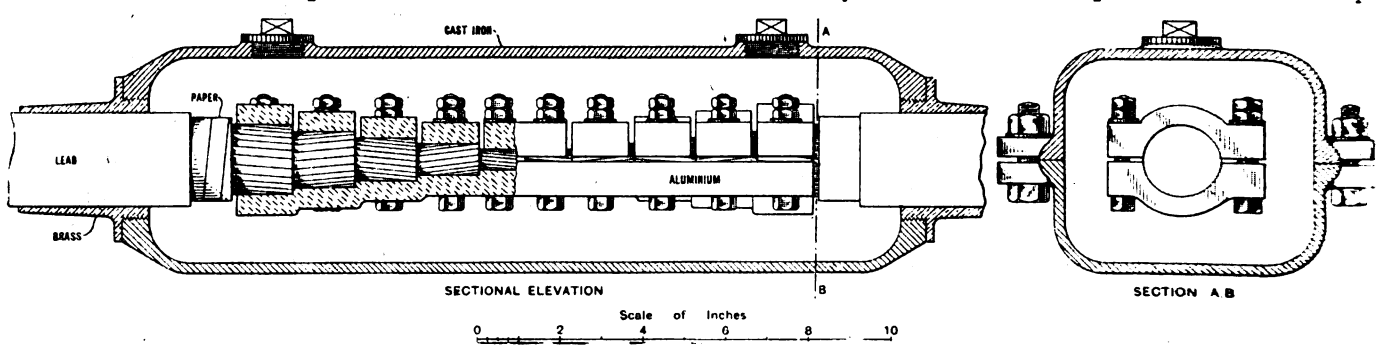

FIG. 2.—STRAIGHT-THROUGH STEPPED JOINT DESIGNED BY MR. S. L. PEARCE FOR 1·66 SQ. IN. ALUMINIUM CABLE AT MANCHESTER.

across the two clamps would be measured, and this gave a resistance of less than 0·002 ohm.

There are 2,500 yards of single-core aluminium distributing cable in use at Ealing, and the majority of the services on this are connected up in the manner illustrated in Fig. 1, but there are some cast T-joints which, though giving a feeling of greater security, have the disadvantage of taking longer to make, and requiring the stripping of a considerable length of cable. Mr. Knight informs us that a man who can make six service joints in a day on a copper cable takes the whole day to complete one of these cast-welded service joints on an aluminium cable.

Although the above tests show that a simple clamp joint over the outer layer is sufficient for service connections, something more effective is required for a straight-through joint, through which the whole current has to pass, or for the connection at the end of a

Digitized by Google

large cable. The advantage of using aluminium is most apparent in the larger sizes of cable, as already explained, and, if currents of 500 to 1,000 amperes have to be dealt with, even a resistance of one-thousandth of an ohm will cause a large drop in voltage and a corresponding evolution of heat. For instance, a resistance of only 0·001 ohm in the path of 500 amperes means a fall of potential of half a volt, and a loss of 250 watts that must be dissipated in heat. It should be pointed out, however, that similar losses would occur with large copper cables if jointed by clamps without sweating the strands together.

Where there is room for the cable to be stripped back several inches, a "cast-weld" joint or end connection, as used at the ends of the Ealing cable, is most satisfactory. The mould and cable ends should be heated before pouring, so that the metal may not be chilled on entering. For connecting an aluminium cable to a copper cable, the cast-welded lug is bolted to the lug of a bronze ferrule sweated on to the copper cable in the ordinary way. It has been found best to have a flat surface between the two metals, and the joint must, of course, be protected from moisture and the atmosphere by paint or an insulating composition. This type of end connection is employed at Ealing. The joint between the connecting lugs on the aluminium and copper cables is enclosed in a wooden box and filled up with insulating compound. One of the authors inspected four such joints just after they had been opened up after nine months' service, and found them perfectly clean and free of corrosion at the junction of the aluminium and bronze surfaces.

Mr. Arthur A. Day, Engineer and Manager of the Bolton Corporation Electricity Works, informs us that he has nine large aluminium cables in use as feeders from a rotary converter sub-station to the works of Messrs. Dobson and Barlow. These are ordinary paper-insulated lead-covered cables laid in wood troughing, without filling, and carried over the roofs of the works. Each cable is 160 yards in length, contains 91 strands, and has a section of 1·67 sq. in., *i.e.*, the equivalent of 1 sq. in. of copper. Terminals clamped to the ends of these cables were not found satisfactory, and sweated terminals were used. In fixing these each strand of the cable was tinned separately under the flame of a blow lamp with a special solder provided by the makers, the British Insulated and Helsby Cables, Ltd. The strands were then inserted in the terminal, which was then filled, whilst hot, with very hot metal. These sweated terminals have not given any trouble.

We were permitted to make some experiments with clamp joints for end connections, on a drum of 37/12 aluminium concentric lead-covered cable belonging to the County of London Electric Supply Co., who are making trials of aluminium cable for feeders.

The cable is 0·3 sq. in. in section, corresponding to a copper section of 0·18 sq. in. Our tests were made on the inner conductor only. A parallel clamp made in three parts side by side, all establishing contact only with the outer 18 wires of the 37-strand, was fixed at one end, and a stepped clamp giving direct contact with the central 7-strand, the next layer of 12, and the outer layer of 18, was placed on the other end. An alternating current of 120 amperes (about two-thirds full load) was then passed through the cable for eight hours. At the end of this time, the parallel clamp was so hot as to be unbearable to the touch, but the stepped clamp was not too hot to be handled. The clamps were quite small, however, and a larger clamp which would not heat up so much would be quite practicable.

Resistance tests were made on the same cable, and it was found that with carefully cleaned wires at each end the resistance could be made as low with clamps connecting to the outer layer only, and screwed down very tight, as with a pair of three-part step clamps. The test on load demonstrated, however, that the stepped clamp is certainly preferable.

Similar tests, pointing to the advisability of employing stepped clamps for aluminium cable, have been made in the testing department of the Manchester electricity works, and, as a result of these tests, Mr. Pearce designed the straight-through joint illustrated in Fig. 2, which will be employed on the 8,000 yards of 1·66 sq. in. aluminium feeder cable (equivalent to 1 sq. in. copper) recently ordered from the British Insulated & Helsby Cables, Ltd.

Enough has been said to demonstrate that the jointing up of aluminium cables, whether for feeders or distributors, offers no insuperable difficulty, and that it should not be sufficient to deter any engineer from profiting by a fair saving in the price of the cable itself. He has merely to ensure that good joints are made at the outset by one of the methods given, and that all mechanical joints are placed in suitable boxes filled up with compound to prevent access of air and moisture to the joint and possible oxidation and corrosion.

As a good copper to aluminium joint can be made with proper clamps—an improvement on the design in Fig. 1 is, of course, no difficult matter—there will be no advantage in employing aluminium service cables at present prices. If copper becomes so dear as to make this advisable, the consumers' ends of the cable will have to be jointed to extensions of the terminals of the service fuse-box, and placed in a sealing chamber, as is done in the best practice with ordinary paper-insulated, lead-covered services.

Another question to be considered is the cost of ducts and laying. On the solid system, and also on the drawn-in system, an increase in the size of the ducts and excavation is conceivable in some cases, but we do not think that this is of great import. For "direct in ground" systems, on the other hand, if armoured triple concentric is employed, copper cables will be cheaper than aluminium, and it is doubtful whether the gain with ordinary armoured concentrics will be great until the prices of aluminium and copper are more widely divergent.

The design of the service boxes has been considered by some to be a deterrent from using aluminium cable, but standard sizes and designs can practically be employed throughout. The clamp connectors ordinarily employed for copper cables will be as efficient as the clamp in Fig. 1, if properly fitted and screwed down, and the box itself need only be of a size corresponding to the outer diameter of the cable; whether the cable is led in through a sealing chamber or the lead is wiped on to a sleeve, a certain amount of clearance is always permissible. In estimating the cost, therefore, it should only be necessary to make allowance for the larger service boxes and fittings required for the aluminium cable, owing to the diameter of the conductor and lead being larger than in the equivalent copper cable, and to add a provision for the extra cost of the comparatively few straight-through joints and of the end connections.

An advantage in favour of aluminium cables, which, however, only comes in for short lengths of large section, may also be mentioned before closing this article. Owing to the larger conductor as compared with the equivalent copper cable, the radiating surface is greater, and it is found that the cables can carry a greater current than copper cables of the same resistance without overheating. This will probably only be of practical application in the case of cables of short length, as in most cases networks are designed on the basis of drop of voltage and not of current-carrying capacity.

We will conclude by expressing our thanks to Mr. A. Jacob, of the British Aluminium Co., Ltd., and to Mr. T. Horne, his assistant, for giving us useful information and helping in the carrying out of the tests, and also to Mr. S. L. Pearce, of Manchester, for particulars and drawings in connection with his large aluminium cables, to Mr. A. A. Day for the details we have given of the Bolton cables, and to Mr. Knight for permitting us to test the cables at Ealing.

ELECTRICAL WORK IN THE NAVY

IN the course of an address to the students of the Institution of Electrical Engineers on Wednesday of last week, Mr. C. H. Wordingham (Electrical Engineer in Chief to the Admiralty), made some interesting remarks on electrical work in the British Navy. After referring to his organisation of the Admiralty electrical staff some seven years ago, Mr. Wordingham explained how the Admiralty standard sizes of cable had originated in the fact that a 16-c.p. lamp took one ampere at 60 volts (the pressure then employed), and that one No. 20 S.W.G. wire carried this nicely. Thus a 10/20 cable was specified for 10 lamps, a 50/20 for 50 lamps, and so on, such strange cables as 80/20's and 60/20's being in common use. Among the special terms in use among electrical naval men is "balancing," meaning the testing of insulation resistance, and derived from the Wheatstone bridge or balance now replaced by the "Megger." Lead-covered, rubber-insulated cables are known as "armoured" cables; circuits are spoken of as being "charged" instead of "alive," and the expression "fork in" is used for connecting in parallel.

The conditions on board warships are particularly exacting. Some of the gear has to be exposed to the weather, but the worst conditions are met with below, where the temperature may rise to 180°, or even 200° Fahr., and where the air is extremely moist. Hygroscopic insulating materials must not be exposed, and great attention must be paid to surface leakage and the provision of long paths to earth from all live parts. Mica and micanite have, however, enabled as high a standard of insulation to be maintained as on shore. The usual rubber cable ratings are based on the assumption that the final temperature shall not exceed 130° F., and as the initial temperature on board ship often exceeds this, the difficulties met with in cable work are obvious. It has been found possible to introduce paper-insulated cables for some of the largest cables, but not for the smaller sizes, chiefly on account of the difficulties of fitting and maintaining the sealing of the ends when the ship is in commission. The high temperature also leads to difficulty with fine wire copper windings, main contacts, oil dash-pots, &c. An important feature of naval work is the necessity of keeping down the weight of apparatus, as it has all to be floated. Tubular construction for switchboards, the use of pressed sheet steel in place of cast metal, the elimination of slate and marble, are all partly results of this. The use of aluminium has, so far, not been attended with success, for it readily corrodes in the presence of moist sea air, and threads tapped into it consequently strip. On the other hand, strength is essential, and in this connection Mr. Wordingham mentioned that a massive gun-metal key, provided on naval telephones, had been frequently known to shear off a pin over $\frac{1}{8}$ in. diameter, on account of the excessive energy with which the average bluejacket considers it necessary to carry out the instruction "Press." A capstan motor designed to work at full load for a few seconds has been kept running for hours at a time at full load, and coal-hoists designed for high speeds have been used to haul up torpedo nets very slowly. All gear must of necessity be watertight on account of the frequent and thorough use of the hose for cleaning after coaling. Any means of adjustment are invariably tried over their whole range by the curious sailor.

Turning to the question of standardisation in naval work, Mr. Wordingham pointed out how necessary this is in view of the carrying of the gear to all parts of the world, far from facilities for repair, and the transfer of men from ship to ship. The difficulties in the way, however, are almost insurmountable. The Admiralty naturally wish to benefit by the continuous progress in design, and to obtain their designs from manufacturers who have had experience in turning them out in large quantities, and, on the other hand, repeated selections from designs tendered by different firms result in several different types being introduced. However, it has been found possible to standardise rigidly such details as brushes, terminals, watertight glands, and the policy now is to specify most definitely the requirements of the apparatus and to lay down the general lines of construction, leaving the actual design to the manufacturer.

Continuing, Mr. Wordingham explained that the electrical plant on board ship is exclusively in the care of naval men. The officer primarily responsible is the torpedo-lieutenant; under him are electricians who have had experience in the dockyards and on H.M.S. *Vernon*, and various ratings of torpedo-men. Costs and commercial efficiency do not concern the naval man, whose idea of efficiency is that the gear shall do what it is expected to do without breaking down. The [illegible]tion of the gear is done exclusively by civilians. There are three grades of electrical engineer in the Admiralty service, namely, electrical engineer, first assistant, and second assistant. An electrical engineer is in charge of each dockyard; the first assistant looks after the supply of light and power to the yard, and the second assistant is engaged on fitting up the ships and doing repair work. The whole of the designing is done at the Admiralty, where there are a number of electrical engineers and second assistants. The only posts open to outsiders are those of first assistants, and all other men are selected from the dockyard electrical staff, to which entrance is gained by apprenticeship at the age of fourteen years.

Mr. Wordingham also gave his audience some excellent advice and outlined his views of the education question. The engineer's training, he said, should be of the broadest possible nature. On leaving school at sixteen, the student should go direct to an engineering college for three years, and then enter an engineering works as an articled pupil or apprentice, the whole training thus occupying five or six years. Mr. Wordingham then discussed the different branches of the profession, pointing out the special qualities and knowledge required in each. Referring to wiring work, he expressed the opinion that this work should be relegated to the "despised plumber" and ironmonger, who, however, should be properly trained for the work.

ELECTRICAL BILLS IN PARLIAMENT

WE give below some particulars of those private Bills of electrical interest which are to be promoted in the next session of Parliament, of which notice has been given. The period for giving notices has not yet expired, and we shall refer to the remainder in our next issue.

Central London Railway Co. propose to construct additional lines in order to join up with the Great Western Railway; London County Council are applying for powers in respect of 14 new tramway routes; London United Tramways Co. are asking for an extension of time for the construction of tramways in Richmond; London Electric Railways Co. propose to extend their line from Edgware Road to Paddington, to connect the District and Charing Cross, Euston & Hampstead Railways at Charing Cross, and to make further provision with regard to the company generally; Metropolitan District Railway proposes the appointment of a Joint Committee to purchase or lease the Lots Road power-house and to supply electrical energy to any person or company, and, among other things, to construct new lines in Kensington and Fulham.

Fife Electric Power Co. will seek power to supply energy in their power area for lighting purposes.

Schemes for the installation of trolley omnibuses are proposed for Malvern, Rotherham, Oldham and Saddleworth, and Brighton and Hove.

Tramway Bills are being promoted by the Belfast Corporation, Bristol Tramways Co. (extension of time); Metropolitan Electric Tramways, Ltd. (new lines in Walthamstow, Enfield, Edgware, Hendon, Willesden, Hampstead, and Edmonton, &c.); Notts and Derbyshire Tramways Co. (revival of power, extension of time, &c.).

Electric Lighting Provisional Orders will be applied for in respect of Acton (transfer of undertaking to Metropolitan Electric Supply Co.), this Bill depends upon the plebiscite of the ratepayers now being taken; Truro; Littlehampton and Bognor; Winchester (transfer of undertaking to Corporation); Uxbridge (transfer of undertaking to Callender's Cable & Construction Co.); Witney; Newcastle-upon-Tyne Electric Supply Co. (extension to Kenton); Accrington (extension of area); Bermondsey (extension of area).

London Electric Supply Bill.—In the House of Lords on Monday the London Electric Supply Bill was read a third time and passed. This Bill, which has already passed the House of Commons, constitutes the London County Council the purchasing authority of the undertakings of the West End electric lighting companies, which were omitted from the London Electric Supply Act of 1908

British Trade with Australasia.—His Majesty's Trade Commissioners in Australia (Mr. C. Hamilton Wickes) and in New Zealand (Mr. G. H. F. Rolleston) will visit this country early next year with a view to visiting the industrial centres and giving British manufacturers and merchants an opportunity of consulting them with regard to trade conditions in the Dominions referred to. Representative commercial associations interested should place themselves in communication with the Director of the Commercial Intelligence Branch of the Board of Trade at 73 Basinghall Street, London, E.C., before the end of January. His Majesty's Trade Commissioners report to the Board of Trade any opportunities in the form of contracts open to tender, the nature and extent of foreign competition and other matters of commercial interest, including changes in Customs duties and regulations, financial and trade conditions, changes in regard to means of transport, and legislation affecting trade and commerce, and they furnish periodically lists of probable buyers of European goods in the Dominions.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published November 17th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

24,561/09. **Wiring Conduit.** L. MILNE (London). To avoid the use of inspection boxes, the conduit is interrupted for a few inches at any point where inspection or manipulation is desired, and the two ends are splayed out and threaded so that a short tube of larger diameter can be screwed on. The threads are such that the tube can be screwed off by rotation and then slid along over the conduit so as to expose the wires. An externally and internally screwed auxiliary collar is employed for connecting up the tube to the conduit. Seven figures.

24,813/09. **Cooking Apparatus.** A. F. BERRY (Ealing). In electric hot-plates comprising resistance windings mounted upon insulating carriers, and supported between sheets of insulating material, the carriers consist of segments or quadrants of a disc of thin sheet mica with the heating windings wound over the segments so as to be equally disposed on both sides. Further sheets of mica are placed on both sides of the heating elements, and the whole is fixed between recessed metal plates supported on a disc of heat insulating material, so as to throw the heat upwards. Four figures.

24,843/09. **Locomotive Motors.** A.-G. BROWN, BOVERI & CIE. (Baden, Switzerland). This patent covers an improved driving gear for large electric locomotives in which the wheel axle is driven by a coupling rod attached to a crank on the end of an auxiliary shaft passing through the hollow shaft of the motor. The interior shaft is connected at the other end to the hollow motor shaft by a universal joint in order that irregularities set up from the wheel axle will not be transmitted to the motor. The wheel axle and interior shaft are also connected by a distance rod with sleeves or bearings at each end. Four figures.

29,069/09. **Arc Lamp.** H. HIRST and A. E. ANGOLD (Salford). In a flame lamp of the stop pattern, the carbon and its abutment are relieved of some of the weight of the frame and guiding parts by providing the abutment carbon with a combined clutch and guide pivoted to its carbon holder. This lessens the risk of breaking the carbon, and allows it to burn to a longer point, so that the arc is further removed from the abutment. Three figures.

2,263/10. **Arc Lamp Mechanism.** H. C. BLACKWELL. Both the cores and coils of the controlling solenoids are moveable and are connected together mechanically by links or chains. The two parts react upon each other, and take up a position of magnetic balance. Stops are provided to limit the motion. It is stated that a feed of remarkable steadiness is obtained. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: MENSING [Arc lamps] 25,373/09; HEIMANN and SCHAFFER [Running arc lamps in series with incandescent lamps] 747/10 and 11,583/10; SIEMENS SCHUCKERTWERKE-GES. [Searchlights] 11,054/10.

Dynamos, Motors, and Transformers: LANCASHIRE DYNAMO & MOTOR Co. and MASON [Electrical operation of planing machines and other reciprocating tools] 22,234/09; DE COSTER [Dynamos] 4,758/10; SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckertwerke-Ges.*) [Moveable coil constant current transformers] 13,015/10; HOSKINS [Rotary transformers] 15,938/10; SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckertwerke-Ges.*) [Starting arrangements for single-phase series commutator motors] 18,848/10; CASE [Motor control] 22,708/10.

Electric Ignition: BROOKS and ALSTON [Sparking-plugs] 12,820/10.

Electrometallurgy and Electrochemistry: GUYE and DARIER [Manufacture of alkali nitrates] 15,525/10.

Heating and Cooking: KRATT [Water heater] 25,296/09; LOFQUIST [Heating apparatus] 10.097/10.

Incandescent Lamps: KUZEL [Exhaustion of metal filament lamps] 25,889/09; SIEMENS BROS. & Co. and HUDDLESTON [Lamp cap contacts] 1,597/10.

Switchgear, Fuses, and Fittings: ROYCE and SHARP [Automatic switchgear] 25,040/09; SMITH, MITCHELL, ASKHAM and HEY [Electric irons] 27,816/09; PARKINSON, and W. & B. COWAN, LTD. [Street lamps] 29,093/09; ELECTRIC CONSTRUCTION Co., and CLOSE [Motor controllers] 29,200/09; SCHRÖDER [Time switches] 30,216/09; SIEMENS BROS. & Co. and HUDDLESTON [Lampholders] 1,597/10; EVERSHED & VIGNOLES, LTD., EVERSHED and PAYNE [Terminals] 11,277/10; SCHREIBER [Lamp protectors] 11,616/10.

Telephony and Telegraphy: MUIRHEAD & Co. [Condensers and artificial line for duplex telegraphy] 25,103/09; VON KRAMER [Inductive wireless telephone system (for trains)] 25,407/09; MATTHEWS [Wireless telephony] 25,639/09; AMERICAN AUTOMATIC TELEPHONE Co. and GOODRUM [Selective switches] 25,896/09; SMITH [Telegraph strip feeds] 26,784/09; NUSSBAUM [Microphones] 3,179/10; ESPARZA [Reinforced concrete poles] 10,676/10; BAEHR [Telephone diaphragm] 21,328/10.

Traction: HEENAN & FROUDE, LTD., and SCHOLEFIELD [Motor suspension] 26,963/09; WALTERS ELECTRICAL MANUFACTURING Co. and MOORE [Device for warning of approach of train] 4,541/10; VAN DAALEN [Traction controllers] 11,437/10; GRUPE [Signalling] 15,175/10.

Miscellaneous: COWPER-COLES [Smoke consumption] 22,783/09 and 25,437/09; RICHARDS and PRINGLE [Distillation of coal for production of fuel] 25,019/09; WORTH, MACKENZIE & Co. [Control of winding engines] 25,516/09; METZGER and SMITH [Electric and electro-pneumatic organs] 25,932/09; LEFEVRE [Advertising device] 552/10; LUMIÈRE [Advertising signs] 4,270/10; JACOVIELLO [High-frequency oscillatory generator] 7,184/10; BRANTINGHAM [Advertising signs] 11,068/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: SIEMENS SCHUCKERTWERKE GES. [Search-lights] 14,354/10.

Incandescent Lamps: CERVENKA [Filaments] 8,341/10.

Instruments, &c.: BECKER [Speedometers] 22,045/10; EHRHART [Hydraulic dynamometer] 22,285/10.

Switchgear, &c.: NÈPLE [Lamp supports] 24,818/10.

Telegraphy, &c.: CARPENTIER [Baudot perforated strip transmitter] 19,102/10; NEUHOLD [Automatic telephone system] 23,669/10; GOLDTHORP [Wireless receiving apparatus] 25,280/10.

Traction: TH. GOLDSCHMIDT [Butt-welding of rails] 24,389/10.

Miscellaneous: DR. C. OTTO & Co. GES. [Distillation of coal] 19,552/10; WEINTRAUB [Boronised conductors] 25,032/10.

Opposition to Grant of Patents

8,875/09. **Storage Battery Plates.** G. OKILL. This patent has been granted in spite of opposition. It covers a process of manufacturing plates of the rolled grid type (see ELECTRICAL ENGINEERING, May 19th, 1910, p. 330).

11,773/09. **Wiring Fittings.** S. JOHNSTON. The opposition to this patent has been unsuccessful, and the patent allowed. It relates to ceiling roses, junction boxes, &c., in which the connections are made without screws and without cutting the main cables, by plunger contacts pressing on to bared portions of the cable.

14,318/09. **Cranes.** STOTHERT & PITT, and W. PITT. This patent has also been allowed in spite of opposition. It covers various mechanical details of electric cranes and transporters.

29,960/09. **Fan.** J. KEITH and C. TUSON. Opposition has been entered to the grant of this patent. It relates to a roof ventilator for ship's cabins, railway carriages, &c., comprising a fan runner direct driven by a vertical motor suspended in an open frame. A volute fan case is mounted on ball bearings on the upper end of the frame, and can swivel round the axis of the fan by the action of the wind on a guide vane attached to the casing.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: BRITISH THOMSON-HOUSTON Co. (*A. D. Lunt, U.S.A.*) [Three-wire distribution system] 13,972/00; E. PARRY and F. W. BIDDER [Manholes for cable conduits] 17,224/02.

Dynamos, &c.: BRITISH THOMSON-HOUSTON Co. (*C. P. Steinmetz, U.S.A.*) [Starting and speed-regulation of induction motors] 18,095/97, and [Rotary converters] 13,972/00; ELEKTRICITÄTS A.-G. vorm. W. LAHMEYER & Co. [Compensated single-phase commutated motor] 11,441/05.

Electrometallurgy, &c.: COMPAGNIE FRANÇAISE DE L'OZONE [Water sterilising apparatus] 27,621/04.

Incandescent Lamps: A. E. GIMINGHAM [Candle-lamp] 17,190/04.

Instruments, &c.: J. HIKELY and NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY Co. [Prepayment meters] 15,969/05.

Storage Batteries: M. ROLOFF [Increasing capacity of negative plates] 16,008/05.

Switchgear, &c.: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Automatic motor starters] 17,021/04, and 17,024/04; R. F. YORKE [Wiring system] 15,836/05; F. F. ROBINSON [Bell pushes] 15,862/05.

Telephony, &c.: P. M. JUSTICE (*Rowland Telegraphic Co., U.S.A.*) [Intercommunication telegraph system] 15,474/01; E. DUCRETET [Helical coil transformers for wireless telegraphy] 17,034/03.

Traction: BRITISH THOMSON-HOUSTON Co. (*E. W. Rice, U.S.A.*) [Traction motor control] 16,716/98; Y. SANZ [Life guard] 16,761/03.

Miscellaneous: A. V. GROUPE [Braiding machine] 15,608/01; G. B. BOWELL and PEARSON FIRE ALARM SYSTEM [Electric fire alarm] 16,920/02.

LOCAL NOTES

Acton: *Proposed Sale of Electricity Undertaking.*—The poll of the ratepayers with regard to whether the electricity undertaking shall be transferred to the Metropolitan Electric Supply Co. has resulted in a majority of 202 in favour. About a half of the members of the Council have expressed their intention of refusing to abide by this result, on the ground that the case against selling the undertaking has not been fully placed before the ratepayers.

Australia: *Fremantle: Accounts.*—The income from the municipal lighting and tramway accounts for the year to August 31st was £38,041, and the working expenses £27,881, an increase of £1,646 over the previous year. After meeting capital charges there is a net balance of £9,095. Of this a sum of £1,717 has been set aside for depreciation.

Adelaide: Tramway Purchase.—The Council have been recommended to enter into negotiations for the purchase of the Adelaide Electric Supply Co.

Ayr: *Tramway Extensions.*—Bailie Copland proposes to move at the next meeting of the Council that the extension of the tramways to Hawkhill, for which Parliamentary powers have already been obtained, should be put in hand.

Birmingham: *Hospital Equipment.*—The new Electrical Department of the Birmingham and Midland Hospital will be opened to-day. The total cost of the Department has been £2,000.

Blair Atholl: *Cheap Electric Light.*—With reference to the recent statements as to the supply of electricity to cottages at Eccles for a fixed weekly charge, it is pointed out that the Duke of Atholl, who is at present engaged in lighting the village of Blair Atholl with electricity at the rate of 5s. per 16 c.p. lamp per annum, which is worked out at $1\frac{7}{13}$d. per light per week. Current is supplied from the installation which supplies Blair Castle, three Pelton wheels being used in connection with the Slainthe River. The streets are also being lighted by electricity.

Bognor: *Electric Lighting Order Transferred.*—The Council recently decided to apply for an Electric Lighting Provisional Order, and at least one member of the Council has cherished the impression that they would be able to sell it at a profit to a company. The Town Clerk, however, has brought to the notice of the Council the views of the Board of Trade on this matter, which are strongly against this class of transfer. A resolution has now been carried in favour of applying for an Order, and apparently an effort is to be made to induce the Board of Trade to grant a clause allowing the Council to deal with the Order as they think fit.

Canada: *Electric Power Commission.*—The *Board of Trade Journal* states it has on file at 73 Basinghall Street, London, the first and second annual reports of the Hydro-Electric Power Commission of Ontario, a Department of the Provincial Government, undertaking the distribution of electric power from the Niagara Falls to municipalities in Ontario.

Dartford: *Tramway Extension.*—The lessees of the tramways propose to extend the lines to link up with Gravesend. The following agreement has been come to for the charge for power supply during the next five years: 1½d. per unit for the first 100,000 units per annum, 1⅜d. per unit from 100,000 to 250,000 units, 1¼d. per unit from 250,000 to 400,000 units, and finally 1d. per unit for all consumption over 400,000 units per annum.

Donaghadee: *Electric Lighting.*—The Council have definitely decided to apply for an electric lighting Provisional Order.

Fleetwood: *Electric Lighting Charges.*—At the last meeting of the Council a suggestion was made that a Sub-Committee should be appointed to revise the electric lighting charges. It was stated that there are seven different rates for lighting, but it was decided to wait until the end of the present financial year before moving in the matter.

Glasgow: *Electricity Charges.*—Mr. W. W. Lackie, the Chief Engineer to the Electricity Department, has presented a report upon the supply of electrical energy for cooking and heating from the lighting circuits. From an examination of a large number of consumers' accounts, he has come to the conclusion that the maximum demand averages 800 hours' use of the maximum demand per annum. The present charge for lighting is a flat rate of 3d. per unit, and he suggests, in order to meet the growing demand for all domestic purposes, that the charge should be 3d. per unit for the 800 hours' use for the maximum demand, all current over that to be charged at 1d. per unit. Mr. Lackie believes this will lead to a considerable use of electricity for intermittent heating in spring, summer and autumn, when only occasional heating is required. This is the time of the year when they have a considerable amount of plant standing idle, so that heating units supplied at 1d. would be profitable. Since the Smoke Abatement Exhibition, Mr. Lackie has had numerous applications for electricity at power rates from domestic consumers for the use of electric irons. The Electricity Committee recommend that the proposals be given effect to as from June last.

Gloucester: *Municipal Wiring.*—The proposal of the Electricity Department that they should pass on to local contractors orders for heating and cooking apparatus and meters, and to charge a commission at such a rate as would prevent undue competition, on the distinct understanding that the Department does not actually sell fittings, etc., or undertake the wiring of houses, was defeated at the last Council meeting.

London: *County Council: Tramways.*—The proposal of the Highways Committee to remove the existing horse tramways in Liverpool Road between Holloway Road and the Angel, Islington, is receiving considerable opposition in Islington, and when the proposal comes before the Council a motion will be made and seconded by the two members for Islington that the recommendation be referred back to the Committee, with instructions to bring up the necessary estimates for converting the lines to electric traction.

Hammersmith: Ventilation of Street Boxes.—The Woolwich Borough Council has been in communication with the Hammersmith and other Borough Councils with regard to the ventilation of street boxes constructed by the Post Office and the Telephone Company in connection with underground lines laid by them. It is pointed out that although in most cases similar boxes constructed by Electric Light Authorities are required to be ventilated, no conditions are generally made as to the ventilation of street boxes fixed by the Post Office and Telephone Company, and with a view to preventing the possibility of explosions owing to the escape of gas into these boxes, the London County Council is to be asked to consider the advisability of framing regulations to ensure a uniform system of ventilation.

Middlesbrough: *Tramcars and Transporter Bridge.*—A proposal is before the Council that tramcars should be transported across the river on the transporter bridge when this is completed. The transporter bridge will be worked by the Corporation, and the proposal is that the Tramway Company should pay a minimum charge of 1d. per passenger carried across. In view of the somewhat early stage of the work of constructing the transporter bridge, the Corporation have decided not to deal with the matter at present.

Portsmouth: *Light Railways.*—The Board of Trade have confirmed an order reviving the Portsmouth and Hayling Island light electric railway.

Scarborough: *Winter Tramway Service.*—The Board of Trade have given their decision with regard to the objection of the Scarborough Tramways Co. to running a winter service. The decision is that a 20 minutes' service shall be run on certain routes, and a half-hour service upon another route. It is said that the Tramways Co. contemplate abandoning the undertaking altogether if this decision is persisted in.

Southampton: *Electricity Showroom.*—The Electricity Committee recommend the Council to authorise an expenditure of £500 in the fitting up of a showroom for the Department.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—Specifications are being prepared, says the *Australian Mining Standard*, for the erection of wireless telegraph stations on Thursday Island and Port Morsby, Papua. Tenders will shortly be invited. Each station is to have a range of about 600 miles.

The Sydney Municipality invite tenders by February 6th for the supply of arc lamp carbons.

The High Commissioner for the Commonwealth of Australia, 72 Victoria Street, London, notifies that he has received tender forms, &c., for the supply of 5¼ miles of telephone cable from the Deputy Postmaster-General, Melbourne. Tenders must reach Melbourne by January 10th.

Austria-Hungary.—The *Board of Trade Journal*, quoting from a Vienna contemporary, states that a loan of £54,000

Digitized by Google

has been applied for by the Salzburg Municipality for electric tramways.

Canada.—According to the *Board of Trade Journal*, an Ontario Company intend to construct an electric railway from Niagara Falls to the Porcupine gold-mining district. It is anticipated that some ten or fifteen miles will be completed this year. The name of the Company may be obtained at 73, Basinghall Street, London.

Greenock.—An expenditure of £4,047 has been sanctioned for a new turbo generating set.

Leek.—An additional generating set is to be installed at the Electricity Works.

Lowestoft.—A loan of £4,050 is to be applied for as follows:—Machinery, £1,300; alterations and additions to buildings, £150; steam pump, £100; meters, £1,500; public lighting, £1,000.

Rotherham.—Tenders are invited for the supply of high tension feeders, rotary converters, transformer, and a switchgear. (See an advertisement on another page.)

Switzerland.—*The Board of Trade Journal* states that a concession has been granted to the Societa delle Tramvie Ellectriche Locarnesi for the construction of an electric railway from Gordola to Bellinzona. The line will be about eight miles long, and the estimated cost is put at £39,680.

Wigan.—Tenders are invited for the supply of low tension lead and paper covered cables, and low tension lead, paper and armoured cables. Particulars from the Borough Electrical Engineer, and tenders by November 28th.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Extensions to new public offices, Westminster. H.M. Office of Works, Storey's Gate.

Proposed new chemical laboratories at University College, Gower Street.

Buildings upon site of Nos. 7 and 9 Broadway, Hammersmith.

Cinematograph theatre at 33 Grove Vale, East Dulwich.

Proposed extension to Hampstead Town Hall.

Electric theatres, 44b Portland Road; 76a Beulah Road; 6 Brighton Road, and 131 Cherry Orchard Road, Croydon.

Tenders are invited for the electric wiring of the Salway Place School, Stratford. Architect, W. Jacques, 2 Fen Court, Fenchurch Street, London, E.C.

PROVINCES.

Brierley Hill.—Additions and alterations to police station, County Surveyor.

Chester.—Alterations and additions to Lymm Grammar School. Architect, H. Beswick, Newgate Street, Chester.

Dover.—Carriage Builders' Institute at Cherry Tree Avenue.

Dunfermline.—Extension of West Fife Infectious Diseases Hospital. Architect, E. Simpson, 16 King Street, Stirling.

Edinburgh.—Alterations at old police station, Torphichen Street.

Glasgow.—Conversion of workshops in St. George's Road to theatre or concert hall. Architect, C. Henry, 32 Minerva Street.—Erection of shops, warehouses and offices in Union Street, Argyle Street, and Mitchell Street. Architect, H. E. Clifford.—Electric theatre in Castle Street. Architect, G. A. Boswell.

Hastings.—Electric lighting at Workhouse premises.

Lancaster.—Conversion of old Municipal buildings for free libraries.

Leicester.—Pavilion and concert hall in Victoria Park.

Maidstone.—Kent County Council Offices.

Margate.—Roman Catholic Church in Cliftonville.

Nottingham.—Extensions to Nottingham and Midland Eye Infirmary. Architect, Arthur Marshall, King Street.

Paisley.—Four-storey tenements in Well Street.

Perth.—Reconstruction for rebuilding of the Academy.—Alterations to Sharp's Institution.

Plymouth.—New Church of St. Martin's.

Stockport.—Extension to Dial Stone Lane Isolation Hospital.

Swansea.—Refreshment rooms and other buildings in Cwmdonkin, Victoria, Dyfatty and Llewellyn Parks. Town Clerk.—Fifty houses in Cwm Road, and fifty-three houses at Trewyddfa. Town Clerk.

Tipperary.—Tenders are invited for an electric lighting and power laundry installation at the Union Workhouse. Consulting Engineer, Mr. L. J. Lawless, 27 Castlewood Avenue, Rathmines, and tenders by December 10th.

Wellingborough.—Rebuilding of Empire Theatre.

Wolverhampton.—Proposed King's Memorial wing at General Hospital.

MISCELLANEOUS

Aberdare.—Tenders are invited by November 26th for incandescent lamp fittings for street lighting; electricity meters; current limiters; time switches and fuses. Particulars from the Town Clerk.

Birmingham.—The Corporation require 60 electric tramcars. Particulars from the General Manager, and tenders by December 12th.

Newcastle-on-Tyne.—The Trimdon Grange Colliery Co. require tenders for electrical fittings, etc., during the coming year. Particulars from Walter Scott, Ltd., Trimdon Grange, County Durham, by December 10th.

Spain.—According to the *Board of Trade Journal* a concession has been granted to the Societa Anonima Varese per Imprese Elettriche for the construction and working of an electric tramway from Varese to Masnago.

A concession has been granted to the Companie General de Tranvias de Valencia for the working of an electric tramway from Catarroja to Silla (Valencia).

Turkey.—*The Board of Trade Journal* states that the date for receiving tenders for the construction and working of tramways in Constantinople has been extended to December 28th. A copy of the specification may be seen at 73, Basinghall Street, London.

TENDERS RECEIVED AND ACCEPTED

London: *Battersea.*—The tender of Messrs. Spagnoletti for three feeder pillars at £78 has been accepted.

Lowestoft.—Subject to the consent of the Local Government Board to the necessary loan, a tender for new condensing plant has been accepted at £1,224.

Perth.—A tender of Messrs. Babcock and Wilcox for mechanical stokers at the Electricity Works has been accepted.

Sheerness.—The Gas and Electric Lighting Companies are in competition for street lighting. The Works Committee favour the use of electricity for street lighting, and recommend the acceptance of a tender by the Electric Lighting Company for 75 lamps at £2 2s. per lamp per annum, which is nearly 50 per cent. less than that of the Gas Company.

APPOINTMENTS AND PERSONAL NOTES

Mr. F. M. Long, Borough Electrical Engineer at Norwich, has been allowed to undertake the work of superintending the running of the Cromer Electricity Works.

Mr. C. E. D. Greenhalgh, late Assistant Engineer at the Malvern Electricity Works, has been appointed Resident Electrical Engineer to the Rainhill Asylum, Liverpool.

Mr. W. Perren Maycock, M.I.E.E., has been appointed lecturer on electric wiring and wiring calculations at the South-West London Polytechnic, Chelsea, S.W.

A foreman stoker is required, with experience of water tube and Lancashire boilers, economisers and superheaters. (See an advertisement on another page.)

The salary of Mr. E. E. Hoadley, Borough Electrical Engineer at Maidstone, has been fixed at £300 per annum and a bonus of one-fifth of the saving in cost per unit sold each year, the maximum salary not to exceed £500 per annum.

The Stoke-upon-Trent County Borough require a meter reader, arc lamp trimmer and mains jointer. (See an advertisement an another page.)

Mr. Lloyd Jones, Station Superintendent at the West Ham Electricity Works, has resigned, in order to enter into partnership with the firm of Messrs. Murray and Co., 21 Walbrook, London, who have business relations with many of the principal power users of this country. Mr. Jones will devote his attention to consulting upon steam raising. He has been presented with a desk by the staff of the West Ham Electricity Department and a silver cigarette case by Mr. H. H. Couzens, the West Ham Electrical Engineer.

Telegraph Traffic.—On the 18th inst., the line between Saigon-Annam and Tonkin was restored, but on the same day communication between Rome and Constantinople was down for a short while, and failed again on the 19th. The El Arich-Hanekin route stopped working on the 19th inst., and on the same day the cable between Tangier and Cadiz was interrupted.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 15s. to £60 per ton (last week, £59 15s. to £60).

Vitrite Lamp Cap Patents.—The following firms announce that they are prepared to defend, at their own expense, any action in respect of patent infringement regarding the use of vitrite caps on lamps of their manufacture:—The British Thomson-Houston Co., Ltd., Cryselco, Ltd., The Edison and Swan United Electric Light Co., Ltd., Imperial Lamp Works (Brimsdown), Ltd., Osram Lamp Works, Ltd., Pope's Electric Lamp Co., Ltd., Robertson Electric Lamps, Ltd., The Sunbeam Lamp Co. Ltd., and The "Z" Electric Lamp Manufacturing Co., Ltd. Particulars regarding the patents in question were given in ELECTRICAL ENGINEERING, November 3rd, page 695.

Lantern Slides.—Messrs. Siemens Brothers' Dynamo Works, Ltd. (Caxton House, Westminster, S.W.), have issued an extended list of the lantern slides of electrical engineering subjects, which they keep in stock and are willing to lend lecturers, etc., free of charge. Many new subjects are included since the last list was issued, and the total number of slides is now 117.

Liquidations.—A meeting of the "Z" Electric Lamp Syndicate, Ltd., will be held at Orient House, New Broad Street, London, on December 9th, to hear the liquidator's account of the winding up. This, of course, is merely the pioneer company of the present "Z" Electric Lamp Manufacturing Co., Ltd.

We are requested to state that the voluntary liquidation of the Westminster Tool & Electric Co., Ltd., of Palace Chambers, Westminster, is due entirely to private reasons, and is not in any way due to its inability to meet its obligations. Not only have all creditors been paid in full, but the shareholders also have been paid in full, with the addition of a substantial dividend.

In consequence of the sale of the business of Telegraph & Telephone Instruments, Ltd., to the Helsby Wireless Telegraph Co., Ltd., the company is to be wound up voluntarily. Particulars of claims should be sent to Messrs. A. Baker and J. H. Webb, 25 Victoria Street, London, not later than November 23rd.

Bankruptcy.—The last day for receiving proofs in the bankruptcy of J. A. Bauer, trading as the Electrical & General Engineering Co., 17 Gracechurch Street, London, is November 30th. The trustee is Mr. G. Corfield, Balfour House, Finsbury Pavement, London.

Dissolutions of Partnership.—R. G. Nye and R. C. Budge, electricians and dealers in electrical apparatus, 69 Leather Lane, London, have dissolved partnership. R. G. Nye continues and P. J. Budge joins the firm.

R. E. Robson and A. E. Coleman, Electrical Engineers, Haymarket Lane, Barras Bridge, Newcastle-on-Tyne, have dissolved partnership. R. E. Robson continues.

Buenos Aires Exhibition Award.—Messrs. Pirelli, Ltd., have been awarded the Grand Prix for their wires and cables by the International Jury at the Buenos Aires Exhibition.

Concert.—The Satinette Association (Employees of Messrs. Pinchin, Johnson and Co., Ltd.) will hold their third annual concert on Friday next, at the Stratford Town Hall, in aid of the funds of the West Ham Hospital. Mr. A. C. Hill, managing director of the company, will take the chair.

Plant for Sale.—Messrs. Leo Sunderland and Co., 39, Victoria Street, London, have a quantity of electrical apparatus, including motors, switches, etc., for sale.

Manufacture of Storage Batteries.—The Sandycroft Foundry Co., Ltd., announce that they have taken over the accumulator business previously carried on by Messrs. W. O. Rooper & Co. and the Epstein Accumulator Co., and have erected up-to-date premises at Sandycroft (near Chester) for the manufacture of storage batteries. A note on these batteries is given in our "Catalogues Received" column.

Forthcoming Books.—Messrs. E. & F. N. Spon (57 Haymarket) announce that the 1911 edition of their "Architects' and Builders' Price Book" will be divided into two sections: "Memoranda and Tables" (2s. 6d. net) and "Prices and Diary" (2s. 6d. net). The work has been carefully brought up to date.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ARC LAMPS.—A leaflet and a folder from G. Braulik call attention to the 1910 pattern "Eclipse" flame arc lamp. This was fully described in ELECTRICAL ENGINEERING, July 14th, page 462. The lamps are made for 6, 8, 10, and 12 amperes for continuous and alternating current for 10 hours' burning. The mechanism is very simple and entirely without clockwork.

METAL FILAMENT LAMPS.—A new folder relating to Foster metal lamps is being issued by the Foster Engineering Co., Ltd. (Morden Road, Wimbledon, S.W.). These can be supplied in large quantities to the trade, and can be over-printed with any contractor's name and address.

ARC LAMPS.—A new illustrated catalogue of "Davy" flame and enclosed arc lamps is being issued by Arc Lamps, Ltd. (Sphere Engineering Works, St. Albans). The Davy "Sunrae" flame lamp is constructed on the four converging carbon principle without clockwork clutches or shunt coils. The carbons are held in V frames, and pass through a nozzle at the lower end of the frame where they meet and support each other, being fed downwards by a gravity weight, making contact at the lower end of the carbons through the frame nozzle, and thereby all need of the metallic strip through, or electro coppering of the carbons. The lamp is fitted with a special patented form of ventilating corona, by means of which the globe is kept free from carbon ash deposit; therefore the full illuminating efficiency is maintained throughout the entire run of the carbons. No inner globe is used. The enclosed lamps, which are listed in a number of forms, are also shuntless.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

STORAGE BATTERIES.—The Sandycroft Foundry Co., Ltd. (Sandicroft, near Chester), who, as announced in our Business Notes, are taking up the manufacture of storage batteries, have produced a complete catalogue giving full particulars of the cells in question. The positive plates are of the Planté type, and special measures are adopted to eliminate all impurities. The design of the plates is such that the useful formed area is eight times the face area. The negatives are of the box pattern, and a special mixture is employed for the active material. Glass separators are used. The sizes at present listed range from 70 to 2,520 ampere hours for lighting and central station cells. Small ignition batteries are also made.

ARC LAMPS.—A revised list of arc lamps for continuous and alternating currents is to hand from Siemens Brothers Dynamo Works, Ltd. (Supplies Dept., 39 Upper Thames Street, E.C.). This contains particulars of the well-known Siemens open type shunt and differential lamps, as well as of the "Caxton" flame arc lamp with vertical carbons. Single and double enclosed lamps are also dealt with, and the lists of accessories and spare parts are very complete.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Companies to be Struck off Register.—The following will be struck off the register of Joint Stock Companies in three months unless cause is shown to the contrary: General Electric Inspection Co.; Simplified Underground Conductor Co.; Telephonic Bell Push Syndicate; Anglo-Spanish Electricity Co.; Chemical & Electrolytic Syndicate; Cycle Electric Lamp Co.; Electrical Castings & Engineering Co.; Greville Electric Inventions; Harwich Electric Lighting & Tramways Co.; Mexican Gas & Electric Light Co.; North Wales & District Light Railway and Electric Power Syndicate; Peru Telephone Co.; Traction Company of the United Kingdom; Tramway Traction Co.

Provincial Tramways Co.—The accounts for the year to September 30th show that a total dividend of 1s. 5d. per share has been paid on the ordinary shares for the year. The sum of £8,000 has been set aside for reserve and depreciation, and £2,831 carried forward. The annual meeting was held on Friday, Mr. Andrew Beattie, chairman of the company, presiding. He drew attention to the great tendency on the part of local authorities to increase the valuation of tramways, and hoped that a better state of things might soon exist. The Portsmouth Street Tramways Co. propose to extend tramways at Gosport to Lee-on-the-Solent. This at present is very inadequately served, he said, and it was difficult to get from there to Portsmouth.

Richardsons, Westgarth & Co.—The report for the year to August 25th shows a profit of £15,142, but after providing for debenture interest and directors' fees, there is a loss of £5,157. This result is an improved one compared with the previous year, and all departments of the three works at Hartlepool, Middlesbrough, and Sunderland are well occupied with work. The auditor's report calls attention to the fact that no provision has been made for depreciation for the past three years.

Buenos Aires Lacroze Tramways.—The gross receipts for the year to June 30th were $3,820,500. The sum of $555,110 has been transferred to repairs fund, and $47,500 to reserve. The sum of $750,000 has been distributed as dividends, and a balance of $3,152 carried forward.

SUMMARY

Our monthly Supplement on Electrical Engineering in Mines is given with this issue. It opens with an illustrated description of the electrical equipment of the Leven Colliery, Fife, which includes mixed-pressure turbine plant. An official report on electricity in mines in 1909 is reproduced, and accounts are given of various meetings where electrical mining matters have been discussed. At one of these Mr. Clothier read a Paper on "Switchgear for Mines." Mr. S. Mavor also chose the power equipment of collieries as the subject of his address to the Glasgow Section of the Institution of Electrical Engineers; while Mr. J. G. Wilson opened a discussion on "Electric Winders," at the Newcastle Section. Some new motor controllers and a fire-damp safety cut-out are also described.

The libel action by Messrs. Griffiths & Bedell against Sir John Benn has again occupied Mr. Justice Ridley and a special jury throughout the week. The evidence on both sides has been completed, and the final speeches are now being delivered. Evidence was given by Prof. S. P. Thompson, F.R.S., Mr. S. Sellon, and Mr. R. W. Weekes in favour of the G.B. system, and Mr. A. P. Trotter spoke to having witnessed some satisfactory trials in the Mile End Road. Sir John Benn contended that all his criticisms were based upon the reports of the Council's officers, who disagreed with Mr. Mordey's reports. He also claimed that many of the statements objected to were pure political criticism not directed against the system or the owners of it. Mr. Justice Ridley on Tuesday suggested ignoring the statements made in the L.C.C., as he thought they were privileged, and, in any case, would not help either side if the case rested on these statements alone. (Page 759.)

A demonstration was held last week of an automatic electric recording target designed by Mr. S. A. M. Rose, of Melbourne. (Page 760.)

Gustav Byng, chairman and founder of the General Electric Co., died last week. (Page 761.)

A mono-rail hoist with power-driven travel, suitable for large works, goods warehouses, &c., is described and illustrated. (Page 762.)

A paper by Mr. Haydn T. Harrison on "Street Lighting" was discussed last week at Manchester and in London by the Institution of Electrical Engineers. The Paper gave particulars of cost of lighting by tungsten lamps in cases where gas had been superceded, and dealt also with various questions relating to efficiency, distribution of light, and cost of street lighting, both by tungsten and arc lamps. In the discussions the need for improved street illumination as the traffic became faster was emphasised, and the suggestion was made that a committee of the Institution might draw up a specification for street lighting. (Page 763.)

Mr. Robert Hammond has given his award in the arbitration between the Paisley District Tramways Company and the Paisley Corporation as to the price to be paid for electrical energy. He has decided that the price should be at the rate of £4 15s. per kilowatt per annum *plus* 0·475d. per unit. He describes the method by which the maximum demand is to be arrived at. (Page 765.)

Among the specifications published by the Patent Office on Thursday was one by the Lancashire Dynamo & Motor Co., for a system of driving planing machines, in which a quick return movement is obtained automatically. C. Kratt describes a water heater comprising a tube of insulating material filled with carbon granules, through which the current is passed. The water is both heated and filtered by its passage through the tube. Opposition has been entered to the grant of a patent to A. F. Berry for a heat storage system for cooking apparatus, and other patents are opposed. Siemens-Schuckertwerke Ges. offer to sur-

Digitized by Google

render a patent for a three-carbon flame arc lamp, in which the swinging carbon is not impregnated. (Page 766.)

Potteries Electric Traction Co. are seeking authority to abandon certain lines authorised a few years ago.—The Beckenham Council are sending a letter of protest to the Local Government Board at the manner in which Mr. H. R. Hooper conducted a recent inquiry.—The Scarborough Tramways Co. have not yet commenced a winter service; a receiver has been appointed in respect of debenture interest.—A public electrically-controlled time service is to be inaugurated in Blackpool.—The Cornwall Electric Power Co. are commencing operations.—London County Council Fire Brigade Committee have suggested certain precautions in respect of Coronation electrical illuminations next year.—A further difficulty has arisen between the Stepney Council and the L.C.C. with regard to the overhead trolley system. (Page 767.)

The Barking Council require a 400-kw. Diesel engine set, reversible booster, &c.; Leyton Council, a 600-kw. mixed-pressure turbo-generator; Islington Council, a high-tension switchboard; and the London County Council, tramway materials. Loans are proposed as follows:—Leicester, £12,000; Ealing, £20,000; Edinburgh, £37,000; Heckmondwike, £24,159; Llandudno, £2,322; Newport, £31,000; Finchley, £10,000; and Southwark, £6,909. (Page 768.)

At the meeting of the Oxford District Tramways Co. last week, it was stated that the arrangement to have a combination of conduit and overhead traction has caused delay in raising the necessary capital. (Page 770.)

Postponement of Institution Dinner.—On account of the General Election, the annual dinner of the Institution of Electrical Engineers (originally fixed for December 6th), has been postponed to Thursday, February 2nd, 1911.

ARRANGEMENTS FOR THE WEEK

SATURDAY, DECEMBER 3rd.

Association of Mining Electrical Engineers.

3.30 p.m. Newcastle Branch, at the Durham University. (1) Continued discussion on "Examination Question." (2) "Inspection and Repair of Electrical Plant Underground," by R. R. Smith.

MONDAY, DECEMBER 5th.

Royal Society of Arts.

8 p.m. Cantor Lecture III. "Industrial Pyrometry," by C. R. Darling.

TUESDAY, DECEMBER 6th.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At University. "The Methods of Braking in Electric Winding Engines," by Dr. E. Rosenberg.

WEDNESDAY, DECEMBER 7th.

Institution of Electrical Engineers: Yorkshire Section.

7 p.m. At Sheffield University. "The Cost of Cooking and Heating by Electricity," by A. J. Cridge.

Association of Engineers-in-Charge.

8 p.m. At St. Bride's Institute, Fleet Street, London. "Practical Notes on the Working and Control of Steam Boilers," by J. B. C. Kershaw.

Committee for Protection of Electrical Interests.

8 p.m. At Institution of Electrical Engineers, Victoria Embankment. Discussion *re* wiring premises, &c., and powers under Electric Lighting Acts.

THURSDAY, DECEMBER 8th.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. "The Magnetic Properties of Iron and its Alloys in Intense Fields," by Sir Robert Hadfield, F.R.S., and Prof. B. Hopkinson, F.R.S.

Institution of Electrical Engineers: Dublin Section.

8.20 p.m. At Royal College of Science.

Rugby Engineering Society.

8 p.m. At 29 Regent Street, Rugby. "Electricity in the Himalayas," by B. F. McMurtrie.

FRIDAY, DECEMBER 9th.

Illuminating Engineering Society.

8 p.m. At Royal Society of Arts. "Recent Progress in Electric Lighting," by Prof. E. W. Marchant.

Telegraph Traffic.—The cable between Oran and Tangier was repaired on 26th inst.—The El Arich route was stopped between Jaffa and Gaza, but was restored on the following day.—Communication between Rome and Constantinople is still down.

PERPLEXED CONSUMER (*quoting from Mr. Balfour's speech at the Albert Hall on Tuesday night*): "... I believe it has only to be *understood* to be approved by the mass of our fellow countrymen."

THE G.B. SYSTEM IN THE MILE END ROAD

In the action by Messrs. Griffiths & Bedell against Sir John Benn for libel in respect of certain statements made by him relating to the G. B. contact system in the Mile End Road, Mr. W. M. Mordey continued his evidence on Wednesday last week. Mr. Mordey's argument was that the system is a perfectly feasible and possible one, even under conditions of London traffic, there being no more practical difficulty in running it than the conduit system. Immediately he found out the difficulties that had to be met it was a simple matter to overcome them. The only alteration he made in the original design by Mr. Bedell was the addition of the condenser device for extinguishing arcs. He said that experiments had shown that the extra current consumption on the system compared with the conduit system involved an expenditure of only 1/100th of a penny per car mile.

In cross-examination by Sir Edward Clark, Mr. Mordey said he was very surprised that the London County Council officials had been salting the track without notifying him, apparently with the desire to make his task more difficult. He was confirmed in this opinion by the fact that the salting car seen by Mr. Bedell had only been traversing the half-mile of track then being experimented with. As a matter of fact, it was not at all improbable that the track had been salted during the summer months before he was called in, as samples of mud and water taken at that time showed 2½ per cent. of sodium. He was at a loss to account for the 19 per cent. extra current, which, according to one of the reports of the Lorain system at Wolverhampton, was required. The effect of Mr. Mordey's evidence was that he stood by every statement made in the report to the London County Council, in which he recommended that the whole of the track from Whitechapel to Bow should be treated in the same way as the experimental half-mile was treated under his supervision.

Professor Silvanus P. Thompson, F.R.S., gave evidence in support of the G. B. system, which he regarded so highly that he had abandoned the system which he had invented in conjunction with Mr. Walker, as he realised he was superseded. Mr. A. P. Trotter, Electrical Adviser to the Board of Trade, spoke as to what he had seen of the G. B. system, but was prevented by his official position from expressing any opinion as to the merits of this or any other surface-contact system. Mr. Stephen Sellon and Mr. R. W. Weekes also spoke highly of the system, the former having recommended it at Oxford.

The case for the plaintiffs was concluded by evidence from Mr. Maurice Hird, assistant engineer to Mr. Bedell, and the foreman of the men supplied by the G. B. Company to instruct Messrs. Dick, Kerr & Co's men in the laying of the electrical portion of the road work. Both these witnesses stated that they had repeatedly complained as to the manner in which the work was being done in respect of the details mentioned by Mr. Bedell, but that all the objections were without avail.

Sir Edward Clark then submitted that there was no cause for action on the part of the plaintiffs, on the ground that neither of them were personally mentioned in the alleged libels. He admitted that there might be cause for action in respect of a trade libel applied to them in respect of a system with which they were connected, but they had to show malice and special damage, but there was no evidence of either. He further claimed that the statements made by Sir John Benn in the London County Council, which were included in the libels, were privileged.

Mr. F. E. Smith, for the G. B. Company, stated that the mention of the G. B. system in the libels clearly referred to Messrs. Griffiths & Bedell, and that Sir Edward Clark's submission on this point was not well founded. He further contended that the libels complained of were not trade libels in any sense of the word, and further that the use of language purporting to express knowledge and authority upon a certain subject could in itself be evidence of malice. As to speeches in the London County Council, he contended that they were only privileged in a qualified manner, and that this privilege could be absolutely destroyed by evidence of indirect motive.

Mr. Justice Ridley said the case should go to the jury.

Sir Edward Clark then briefly addressed the jury. He argued that all the statements made by Sir John Benn were comment upon the matter of public interest, and only in respect of the system as laid down in the Mile End Road, and that he was as clearly entitled to an opinion upon it as the highest expert in the country. It was Sir John Benn's duty, holding the position he did in London government, to draw attention to what was going on in the Mile End Road. He complained of the attack made upon the officials of the London County Council in connection with the system, and felt it was his duty to put in evidence which would clear them from the very serious charges that had been made.

Sir John Benn, in his evidence, said that he had no malice against either Messrs. Griffiths or Bedell, and that throughout he was only criticising the system as laid down in the Mile End Road. The basis of his criticisms was a report of Mr. Fell on July 21st, 1908, in which the Council were recommended to withdraw the cars from public service, and in which figures of accidents were given, and the generally unsatisfactory conditions described. He had also had information from Mr. Gordon, L.C.C. Member for Stepney, and Mr. B. S. Strauss, M.P. for that district. This information referred to the terror of the inhabitants and the accidents to horses, which were described to him as having been roasted. He further stated that, as a business man, he did not think any surface contact system was a desirable thing for London, and had been opposed to its adoption from the commencement. Sir John Benn also referred to the report of Sir Alexander Kennedy, who first advised the Council with regard to tramways in which surface-contact systems were generally condemned for a place like London. He felt he was justified in calling the system the "Mordey" system as it had been modified by that gentleman in a most important respect.

In cross-examination Sir John Benn expressed the opinion that business firms dealing with public bodies were liable to their goods being made the subject of public discussion. He agreed that any criticism in this way must be based upon true facts, and he was there to justify the facts upon which he relied. If the system as laid down in the Mile End Road represnted the G. B. system, then he had attacked it, and meant to do so. He agreed that the G. B. system had been used against him as a political weapon, and that he had used it to retaliate. Asked as to whether he had made inquiries to satisfy himself that the officers' reports were true, Sir John Benn said he had made every inquiry, but Mr. Justice Ridley interposed that he did not think he had. With regard to the statement as to "roasted horses," this was obtained from Mr. Gordon, and it was generally known that a horse had been badly burned on one of the studs. In reply to this Mr. Greer, K.C., who has been called in to assist in the case for the plaintiffs, went through the list of alleged accidents, and pointed out that in the majority of cases no claims had been made for compensation, and that in the case of one horse £45 had been paid. His other expression as to "trusts," "financiers," "company influences," "royalties," and so on, Sir John Benn said were merely political controversy, and must not be applied in a commercial sense in any way. In reply to questions by Mr. Justice Ridley as to whether he had inquired of the G. B. Company regarding the system, witness said he had not, but pointed out that on the opening day both Mr. Griffiths and Mr. Bedell made no complaint to anybody, and seemed perfectly satisfied.

In re-examination Sir John Benn said until the writ was served upon him in the action he was not aware of the statements that were complained of, and was not even given the opportunity of denying the imputations suggested.

Mr. H. H. Gordon, L.C.C., was then called, and mentioned numerous mechanical details in which, in his opinion, surface-contact systems were unfitted for adoption in a place like London. Apart from his own inspections of the system in London and at Lincoln, he had information from text-books that these systems were more inefficient than other systems, and in cross-examination instanced an article by Mr. I. E. Winslow in the 1904 edition of "Modern Electric Practice." In no surface-contact system was there, in his opinion, adequate provision for the safety of the public.

Mr. A. L. C. Fell, Chief Officer of the London County Council Tramways, dealing with the car equipments, said that difficulties arose immediately the G. B. Company were not granted the contract for the road work, and the officials of the Council were placed in the difficult position, that the Company, although supplying drawings and parts of the equipment, refused to be responsible for any of it. It was clearly understood from the beginning that the car equipment had to be fitted to the existing bogey cars without alteration, and every facility had been given for this to be done. The reason was that the London County Council had spent a considerable sum of money in standardising the parts of their cars, and alteration would interfere with the whole plant.

Digitized by Google

It had been complained that he had only given approximate measurements, but he could not do otherwise owing to the large number of parts under the cars that were rough castings and not machined. He had always told Mr. Bedell to get his measurements direct from a car. So far as he was aware the Tramways Department had not suggested the gun-metal insertions to the magnets complained of by Mr. Bedell.

Mr. Fell continued his evidence on Monday. Although the G. B. Company had objected to the Board of Trade inspection, he understood from an interview he had had with them that the objection was withdrawn, and that the difficulties with the magnet on the cars had been overcome. He had, as a matter of fact, recommended the purchase of 12 further equipments for the cars, and this hardly indicated that he was trying to condemn the system. Mr. Bedell had promised to help to produce a magnet that would be effective, as the first equipment fitted by the Company was not successful. Neither the single nor double-magnet equipment gave satisfactory results, and although he differed from Mr. Bedell as to the pull of the two types, the first two-magnet equipment made by himself actually gave a stronger pull in practice than did Mr. Bedell's. He attributed the difficulties mainly to the higher speeds run in London as compared with Lincoln, and denied that he had ever suggested 40 amperes as the starting current of the cars. It was fixed at 60 at an interview between him and Mr. Bedell, but the resistance designed by Mr. Bedell would not allow 60 amperes to pass through it. The experiments on the half mile which was overhauled by the Company were, in his opinion, inconclusive, and all through the running was unsatisfactory and the system inefficient, having in view the public safety. There was also the consideration that a large number of lines elsewhere in London were not being proceeded with owing to this experiment not proving the success it was anticipated. He personally had no knowledge of the salting complained of. He only hammered studs on one occasion in order to test his theory that a horse's hoof could make a live stud, and he succeeded in getting five live studs out of seven.

During his cross-examination Mr. Greer said he wished to make it clear that he did not suggest dishonesty on the part of Mr. Fell by the hammering of the studs. It was Mr. Fell's opinion that the current consumption was excessive compared with other systems, and Mr. Bedell himself had put the energy required for the magnets at 7 per cent. There was also the extra weight of the cars to be taken into account, and other things. The magnets which he had made were of soft axle steel, and gave quite good results, although they were only used temporarily. He disagreed with Mr. Bedell's views that his own magnets were the cause of live studs: there were a considerable number during the time that Mr. Bedell's own magnets were being used. He was honestly of the opinion that Mr. Mordey's experiments were inconclusive, although the results were better after those experiments than before.

On Tuesday it was decided between the parties that the access boxes and sump pits had had nothing to do with the failure of the system.

Mr. Maurice Fitzmaurice, Chief Engineer to the Council, said that he had persevered with the system, and was quite desirous of making it a success, but after the public running he had come to the conclusion that it would not stand the conditions of London traffic. He had suggested the modification of the access boxes because he was convinced the design of Mr. Bedell's would not stand London traffic. He had only suggested an alteration in the construction of the stud, and when Mr. Bedell objected he did not press the modification, and he did not think there was much complaint to be made on that point. He was certainly under the impression that the reduced royalty to £500 per mile was upon the same basis as the original offer of £800 per mile, and that Mr. Bedell would superintend the construction and advise the Council's officers generally in regard to it. Many of the difficulties had arisen through Mr. Bedell refusing to do this. He emphasised the point that Mr. Bedell's complaints about the sumps only referred to the leakage of mud and water through the concrete and not to gas. After Mr. Mordey's reports there were still live studs, and it was for that reason that he decided it was inadvisable to go on.

Mr. Bowden, Rolling Stock Superintendent to the L.C.C. from 1905-8, denied that he had done anything more than make suggestions in order to assist in fitting the G. B. equipment to the cars. Evidence was also given by Mr. J. C. Way, Assistant to Mr. Fitzmaurice; Mr. Horne, Resident Electrical Superintendent of the Northern Section of the L.C.C. Tramways; Mr. A. S. Campbell, Engineer for the Construction of Tramways; and Mr. Venn, Clerk of Works in Charge of Construction Work. All these witnesses gave evidence to the fact that everything that was done in the laying of the track and electrical equipment was tested, and passed by the men provided by the G.B. Surface Contact Co. The driver of the salting cart on the occasion mentioned by Mr. Bedell, was also called, and proved that he had salted both tracks between Aldgate and Bow under the general instructions, owing to the conditions of the weather.

This closed the case for the defendants, and Sir Edward Clark commenced his final speech to the jury. At the close of the day, Mr. Justice Ridley suggested that, in order to reduce the number of points to go to the jury, he proposed to ignore the alleged libellous statements made in the County Council. He considered they were privileged, and did not think they would help the plaintiffs if the case went against them, and that no attention would be paid to them if the jury found for the plaintiff on the first libels.

AN ELECTRICAL RECORDING TARGET

WE were present at the invitation of Rose's Recording Targets, Ltd. (13 and 14 Abchurch Lane, E.C.), at a demonstration on Wednesday of last week of an electric recording target which has been developed by Mr. Sydney A. M. Rose, of Melbourne.

The principle on which the apparatus works is as simple as the way in which it is worked out is ingenious. Inside the target is a roll of paper which can be wound from one drum to another by an electric motor when required. The paper passes behind the actual card target, upon which the bull's eye or other design is marked, and the bullet passes through both. At the time of shooting the paper band is at rest, but when the shot is made and the signal of the position of the hit is desired, the motor is started through a relay from the firing position by a push button, and the paper is drawn over a metal roller over which is a row of spring contacts. As soon as the hole in the paper passes over the roller, the spring corresponding to the position of the hole makes contact, and a signal is sent in the manner described below

Between each adjacent pair of spring contacts is a section of a resistance, more or less of which is placed in the signal circuit according to which spring makes contact, and therefore according to the position of the hit. A source of constant voltage is included in the circuit, and thus the current sent depends on the vertical co-ordinates of the hit, while the horizontal co-ordinate determines the time which elapses from the starting of the motor to the receipt of the signal.

The receiving instrument at the firing position takes account of these two variables in the following way.

In the interior of the instrument there is a moving coil milliampere meter, with its pointer working vertically. This is mounted on a swivelling platform, which can turn the whole movement round so that the pointer is given a horizontal motion. The tip of the pointer carries a small white ball, and moves behind the suitably curved glass screen forming the front of the instrument, and having painted on it the bull's-eye, &c. The glass is sufficiently obscured to allow only the white ball on the pointer to be visible. The rotating platform carrying the milliampere meter is driven through a worm and a pulley mechanically connected by cords to the motor at the target, and thus moves the pointer across the screen with a motion corresponding to that of the paper of the target. The vertical movement of the pointer when a signal current is flowing is determined by the strength of the current supplied, and therefore by the position of the hit on the target. So that, if all adjustments are correct, at the moment of signalling the position of the visible tip of the pointer relatively to the screen corresponds exactly to the position of the hit on the target.

To follow the cycle of operations, suppose the apparatus is set for a shot, that is to say, a fresh section of the paper roll in the target is exposed, and the paper is at rest. The shot is made, and the button is pressed to start the motor. The milliampere meter starts turning round as the paper is rolled in until the hole caused by the bullet passes under the contacts, when a current is sent which deflects the pointer to the right extent, and at the same time actuates another relay which stops the motor. The pointer is thus brought to rest in the required position. When the apparatus is to be reset, the button is pressed again, the motor starts once more, and rolls up the rest of the section of paper until a permanent hole dividing the sections of the paper is reached, when a current is sent and the motor stops automatically. The turning platform in the indicator, having reached the end of its travel, is returned mechanically to the starting position by a spring device, which causes the disengagement of the worm during the return.

It is easy to see that, if desired, a running man can be painted on the paper and shot at while the paper is in motion, when the position of the shot will be recorded as soon as the paper reaches the end of its travel. It should be mentioned that only three wires are required to connect the target and the indicator.

OBITUARY

GUSTAV BYNG.

GUSTAV BYNG, one of the pioneers of the electrical industry in this country, the founder and chairman of the General Electric Co., died on Wednesday, November 23rd. Although he was only fifty-five years of age, his constitution had, for many years past, been undermined by a mortal complaint, against the remorseless advance of which he made a brave but unavailing fight. A few years since, his health became too impaired to allow him to take much part in the administration of the great firm, of which, in conjunction with his intimate friend and co-worker, Mr. Hugo Hirst, he had been founder some twenty-seven years ago. But he continued to take the deepest interest in the General Electric Company, who were able, almost to the last, to profit by his valuable advice and that genius for finance and decision in affairs which had raised the General Electric Company from comparatively small beginnings to its

Gustav Byng.

present proud position amongst the electrical companies of the world. To the late Mr. Byng's family, to whom, in conjunction with his intimate friends and business associates, we proffer our deepest sympathy, his loss is, of course, a cruel blow, yet they have one great consolation inasmuch as he was privileged to enjoy that which has been denied to many great men who have made their mark in the world. It was his happy lot to see two of his sons taking an active part in the business; one of these young men as a member of the directorate, has developed a remarkable aptitude in practical organisation, and has displayed great business acumen. A third son, who carried off a gold medal at Faraday House, is pursuing a further course of studies at Harvard University, while a fourth son is studying law with a view to joining the General Electric Co. in another capacity.

Born in Bavaria in 1855, Gustav Byng received a sound education at the Augsburg Polytechnikum, a school of higher scientific instruction. He came to this country in 1873, at the early age of eighteen, and in 1879 he became a naturalised Englishman. It was about this time that he commenced business on his own account as an electrical engineer and manufacturer of electrical apparatus, and found a kindred spirit and co-worker in Mr. Hirst, whose administrative talents and technical ability was of the utmost value to him in the great work of his life—the building up and constant expansion of the General Electric Company. This great work has occupied some twenty-seven years. The works were originally at Manchester, at the old Peel Works, where the Peel-Connor telephones are now made. But the main works of the company were moved some years ago to Witton, near Birmingham, where 106 acres were purchased as the site of the necessary workshops and other buildings. Mr. Byng took the keenest interest in this great work of development, and supervised with the utmost care the necessary financial arrangements. At Witton, as is well known, there are now, besides engineering shops for the manufacture of the largest electrical machinery, spacious arc lamp and switchboard shops, electrical carbon and chemical factories, steel and brass tube works, an iron foundry, and power-house with a present capacity of 2,500 h.p., and the comfort of the employees is provided for by comfortable mess-rooms, club houses, and workmen's cottages adjoining the works. An idea of the magnitude of the business can be obtained from the fact that no less than 8,000 people are now employed in the various manufacturing and other establishments of the firm in this country alone, there is another large factory in Birmingham, one in London, and, besides the head office in London, branch offices and agencies in all the more important towns in the United Kingdom and abroad.

Mr. Byng was an ardent Tariff Reformer, and long before that movement had reached its present development had placed his views on the necessity of protecting the economic life of the nation, by means of a scientific tariff, in a work entitled "Protection," a source from which such distinguished champions of tariff revision as Mr. Joseph Chamberlain and Mr. Bonar Law have publicly acknowledged having received inspiration. He fought the fight for Tariff Reform when that policy had but few adherents, and it was largely due to his own efforts that the Tariff Reform League, of whose Council he was a member, was founded.

Mr. Byng was a member of the Institution of Electrical Engineers and many other technical and public bodies, and was a strong advocate of combination and co-operation in industry. In the latter connection he has done valuable work as chairman of the Manufacturers' Association of Great Britain, in dealing with industrial legislation, and procuring modifications in foreign and colonial tariffs in favour of British manufacturers.

CORRESPONDENCE

STARTING OF INDUCTION MOTORS.

To the Editor, Electrical Engineering.

Sir,—Mr. Frank Broadbent's description and sketch of connecting protective gear in a motor circuit is interesting, but how does he propose to adapt same to an induction motor where the starter is usually in the rotor circuit while the overload gear is connected on the stator side?

Yours, &c.,

Rugby, A. C.
November 25th, 1910.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 *Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.*

"British Standard Specification for Steel Conduits for Electrical Wiring." The Engineering Standards Committee's Report, No. 31. Revised. (London: Crosby Lockwood & Son.) 5s. net.; by post in U.K. or abroad, 5s. 2d.

ELECTRIC TRAVELLING HOISTS

THE accompanying illustration shows a 2-ton mono-rail hoist manufactured by the Witton-Kramer Electric Tool & Hoist Co. (Witton, Birmingham), and suitable for transport duty in works, warehouses, gasworks, railway goods stations, &c. As shown, it is constructed to run along the under flange of an I-section steel joist, and is controlled from below by four ropes which operate the motor controllers. One motor drives the winding drum, and a separate motor is geared to the four travelling rollers. The motors and controllers are bolted to the under side of a steel plate, on the top of which are fitted the travelling rollers. These hoists are provided with either D.C. or A.C. motors, manufactured by the General Electric Co., Ltd., of Witton. Hoists with D.C. motors have magnetic brakes of the solenoid type with

2-TON ELECTRIC POWER TRAVEL HOIST.

leather-lined brake shoes. This brake is electrically interlocked with the controller, so that it opens when the current is switched on and closes when the circuit is broken, holding the full load in any position. Hoists with A.C. motors are usually provided with mechanical brakes operated from the controller shaft. When required, provision can be made for opening the brakes by means of a separate pendant cord, so that the load can be lowered by gravity without employing current. The controllers are of the drum reversible pattern, with wire or grid resistances, and can be worked by pendant cords as shown, by remote control from a controller fixed on a wall, or from a cab fixed to the hoist itself. A high-speed chain drive is generally used for the first reduction; the remaining reductions are obtained through machine-cut spur-gear. A rope-guiding device permits considerable side pull without the rope overlapping or coming off the drum. Current is collected from the stretched contact wires by trolley wheels with universal swivel motion. The over-winding switches are of the self-replacing swivel-lever type, and are actuated by the sheave block when it reaches its highest position.

Besides the above pattern, this firm makes suspension hoists, comprising a similar gear for suspension from a beam or girder, or for converting the hoisting motion of an existing hand or steam cranes to electric drive by attaching the hoist to the lifting hook of the crane.

A number of illustrated lists have been issued by the Witton-Kramer Co., and can be obtained from them or from the General Electric Co., Ltd. (67 Queen Victoria Street, London, E.C.). Besides the above specialities, these deal with electric winches of various patterns and capacities, with worm, spur, or friction gearing, electric capstans, portable tools, and lifting magnets for loading, unloading, and transporting pig-iron, scrap, plates, steel joists, rails, &c.

TANTALUM AND ONE-WATT LAMPS

AN example of the use of the tantalum lamp for outdoor decorative illumination purposes, where, of course, they are subjected to all the rigours of the weather, is shown in the accompanying illustration of a band-stand in London. Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston), report increasing sales of these lamps, and anticipate a heavy demand in connection with Christmas.

The firm are now placing upon the market a 200-c.p. "Onewatt" lamp. This lamp will be made for voltages from 100 to 130 and 200 to 250 in 200 c.p. The efficiency of the lamp will be precisely the same as that of the 100-c.p. "Onewatt" lamp at present on the market, and the filaments are made of drawn tungsten wire. The prices of the 200-c.p. "Onewatt" lamp will also compare favourably with those of

BAND-STAND LIGHTED WITH TANTALUM LAMPS.

other types of high c.p. lamps at present on the market. They will be supplied with E.S. or B.C. caps as required in spherical bulbs only, the sizes of which will be $9\frac{7}{8}$ in. long by $6\frac{3}{4}$ in. diameter.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

ELECTRICAL EQUIPMENT OF THE LEVEN COLLIERY

THE Leven Nos. 1 and 2 pits belonging to the Fife Coal Company have formed a very good subject for a comprehensive scheme for electrifying the wasteful steam haulage and pumping plants which were formerly in use above and below ground, so reducing to a marked degree the big coal bill that was formerly a very serious item in the operating costs. With this end in view the Company considered favourably the adoption of mixed pressure turbo-generators, and installed in their power-house two British Thomson-Houston Curtis 750 kw. mixed pressure units, designed to give 450 kw. on exhaust steam and the remaining load on high pressure steam at 100 lbs. per square inch. The generators are wound for 2,750 3,000 volts 50 cycles, and each has its own direct-coupled exciter. A separate steam-driven exciter is also installed for stand-by purposes.

The governing and regulating arrangements for both high pressure and low pressure valves are controlled automatically on the hydraulic principle, and the makers guarantee that the variation in speed from no-load to full-load is not more than 2 per cent. Emergency valves are fitted on both high-pressure and low-pressure inlets. The general arrangement of the set is seen in Fig. 3, and a view of one of them is given in Fig. 1.

The condensing plant by Messrs. Körting Brothers is of the multi-ejector type, designed to pass 2,200 gallons of water per minute. To deal with the circulating water two Körting pumps, coupled by "Zodel-Voigt" couplings to a B.T.H. 80 h.p. squirrel-cage induction motor running at 945 r.p.m., have been installed in the basement. These motors are controlled by oil-immersed auto-transformer starters with fuses on the running side. One pump deals with cold water from the cooling pond and discharges through the condenser. The second delivers the hot water from the hot well through the cooling apparatus, comprising Körting spray nozzles, which operate over an area of 1,000 square yards. The spray nozzles, however, are only designed to deal with 1,600 gallons of water per minute, the additional 600 being made up from the pit, and the equivalent quantity allowed to overflow to waste from the hot well. The last condenser to be installed, which is of an improved type, has given exceedingly good results, a 29 in. vacuum with the barometer at 30·3 having been obtained. Steam being available at this point, the company have put in Körting ejectors to prime the pumps in the place of having foot valves on the suction ends of the pipes, the time taken to fill the 12 in. suction pipe 100 ft. in length being only two minutes.

The switchboard, part of which is seen in Fig. 1, was supplied by the British Thomson-Houston Company, and is of the stone cell type, each panel being equipped with isolating switch, interlocked with the doors, so arranged that it is impossible to open them till the oil switch is tripped. There has also been a small transformer and switchgear installed in the power house to enable small motors to replace the steam engines about the pithead, and so dispense with a large network of small steam pipes.

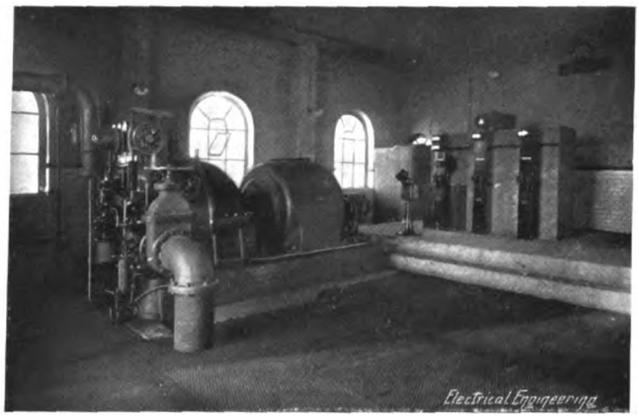

FIG. 1.—EXHAUST STEAM CURTIS TURBO-GENERATOR AND H.-T. SWITCH GEAR.

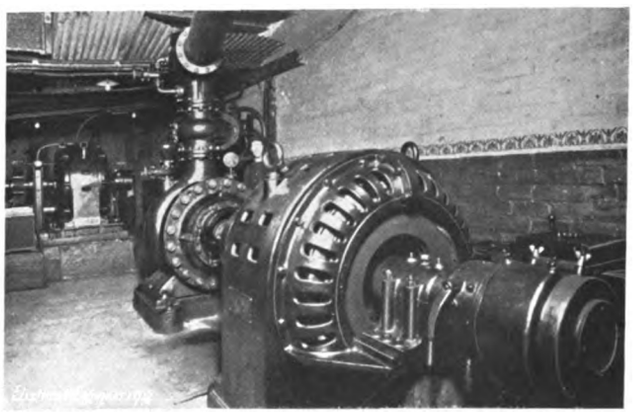

FIG. 2.—UNDERGROUND PUMP ROOM.

When dealing with the underground plant one of the first considerations was the pumping question. To deal with this, the existing pumping plant comprises on the surface, a single cylinder direct-acting pumping engine operating spear rods, the cylinder being 100 in. diameter by 11 ft. 6 in. stroke. This pump is capable of dealing with about 1,000 gallons per minute when working at 3½ strokes per minute. As a stand-by there

Digitized by Google

are two steam pumps which raise the water in two lifts, one pump situated in the shaft bottom lifting 30 fathoms, the second pump being placed at a 30 fathom level, and discharging the water to the surface, a distance of 120 fathoms.

It was decided to discard the underground steam pumps, and these now have been superseded by a high-lift turbine pump. The pump is of the 5-stage Sulzer type, capable of delivering 1,200 gallons of water per minute to a head of 900 feet, and it is direct coupled by a flexible coupling to a 510 h.p. Dick, Kerr motor of the slip-ring type. This pump runs continuously during the week, and the shaft pump, which forms a stand-by, is run during the week-ends. The turbine pump above mentioned is the biggest in Scotland.

The old steam-driven haulage gears underground being within the radius of some 80 yards from the pit bottom, the question of cable distribution is not a very big one. Five complete conversions were carried out. The motors with the extension shafts and outboard bearings were mounted on substantial cast-iron base-plates, which also carried the second motion shafts. The first motion gear was all steel with cut teeth with cast-steel pinion on the second shaft to gear into the existing spur wheel on the haulage drum shaft, the old steam-driven haulages being all geared up. In two cases only was it found possible to keep in the old steam engines, but the work of the conversions was carried out between Friday and Monday, thereby causing very little interruption to the working of the colliery.

The haulage motors are by Dick, Kerr & Co., of Preston, and are of the continuous rating type, capable of developing two and a half times normal full-load torque at starting. The controllers are of the special oil-immersed reversing type, with resistances to give 75 per cent. speed reduction, and special high resistance in the first step for slow starting.

The pumping plant which pumps out of the low workings has also been increased, a turbine pump having been installed. This set is made up of a B.T.H. 150 h.p. slip-ring motor, direct coupled to a Worthington high-lift pump, capable of delivering 600 gallons of water per minute through 1,000 yards of piping against a vertical head of 80 fathoms. Each motor is controlled by a motor panel containing oil-immersed triple-pole automatic switch with ammeter, and potential transformer for pilot lights.

The cable for the underground distribution is of the 3-core solid bitumen type, with a single layer of galvanised steel armour. The shaft, however, being very wet, it was thought advisable to put in single-core in special grooved casing made for the purpose.

Several high-tension motors have been installed on

the surface, and the washery, screens, and workshop have all been electrified. To enable the steam to be entirely cut off the shops, the steam hammer has been removed and a Massey compressed air hammer has been substituted. These hammers have been found to give very good results. The total horse-power in motors for pumping and haulage is 1,440, and the average load on the turbine is about 700 kw.

The question of earthing of the various apparatus at this colliery has been very carefully attended to. In every machine room a copper bar has been fixed up in a suitable place and a stranded earth-wire attached to this from the various pieces of machinery, and an earth-wire is carried from the bar and fixed to the armouring of the feeder cable with a substantial gland.

In conclusion, we wish to express our thanks to Mr. H. Gordon Fraser, chief engineer to the collieries, for the information contained in this article, and for putting drawings and photographs at our disposal.

ELECTRICITY IN MINES IN 1909

IN Part II. of the general report and statistics for 1909 of the chief inpector of mines, some interesting remarks by Mr. R. Nelson (Electrical Inspector of Mines) are included on the subject of electricity in mines. Mr. Nelson remarks that it is not possible accurately to determine what increase there has been in the aggregate horse-power of electric motors in use in mines during 1909, but that increase must have been very substantial. As regards coal-cutting machines, an increase over last year's figure of 40 machines is reported, representing, perhaps, 1,200 h.p. Altogether, at the end of the year there were 777 electrically-driven coal-cutting machines in use, representing not less than 20,000 h.p. in the aggregate. It is, however, obvious that the all-round use of electricity in mines cannot be estimated from a consideration of this figure, for electricity is now applied to every operation requiring mechanical power in and about a mine. The three-phase system of distribution is now firmly established. Apart from the question of electric shock, continues Mr. Nelson, this is a development which will promote safety in operation, and is to be welcomed. As regards electric shock, statistics would seem to indicate that a shock from alternating current is more likely to prove fatal in underground conditions than one of the same voltage from direct current; though it may be that one year's statistics is not sufficient upon which to base a generalisation of this kind.

During the year 1909 there were in all 15 fatal accidents as a result of the use of electricity in coal mines, causing 23 deaths. Three accidents causing nine deaths were due to ignitions of explosive gas by electricity. Two of these, causing seven deaths, were the result of using open-type apparatus, the presence of gas being unexpected by the workmen in both cases. The third was due to a defective "gas-tight" joint between a switch-box and its cover. Of the remaining 12 accidents, 11, causing 13 deaths, were electric-shock accidents, and all took place underground. There was no fatal accident from electricity on surface works throughout the year. Six out of a total of 13 deaths caused by the 11 electric-shock accidents were due to inefficient earthing of outer coverings of apparatus. The most important safeguard there is from electric shock is an efficient connection to earth for all parts liable to become "live" in case of breakdown, and liable to be touched by any person. Three deaths due to defective apparatus were due in each case to contact with bare "live" parts of cables. Three deaths were due to ignorance or excess of zeal in attempting to examine or repair defective apparatus before taking the precaution to cut off the pressure. One death was due to the failure of apparatus, which was unsuited to the circumstances of its use. The eleven electric-shock accidents are tabulated as below:—

Accidents on direct-current systems	2	Deaths ...	2
Accidents on three-phase systems	9	Deaths ...	11
	11		13
Accidents from shocks of 250 volts or less ...	4	Deaths ...	5
Accidents from shocks between 250 volts and 650 volts	6	Deaths ...	7
Accident from shock above 650 volts	1	Death ...	1
	11		13

Ignitions of fire-damp and electric shock account for 14 out of a full total of 15 fatal accidents. The remaining accident, causing one death, was due to a fire which broke out in a motor room in a mine near the down-cast shaft bottom. The smoke and fumes were carried in-bye, and they caused the death of the only man in the mine at the time of the accident, a fireman who was examining the workings before the commencement of a shift. If the fire had occurred after the shift had gone in the loss of life would in all probability have been great. The use of inflammable material, such as timber, in the construction of underground motor rooms should in all cases be avoided.

A number of non-fatal accidents were also reported. The most common occurrence was apparently "shock and slight burns," but in two cases "severe burns" were reported. There were at least three instances of successful resuscitation. In each case the Sylvester method was used, and in two out of the three cases efforts at restoration had to be continued for over an hour before the patient recovered consciousness.

On October 27th the Secretary of State appointed a Committee, consisting of R. A. S. Redmayne, H.M. Chief Inspector of Mines, C. H. Merz, Electrical Engineer, and R. Nelson, H.M. Electrical Inspector of Mines, "to inquire into the working of the existing Special Rules for the use of Electricity in Mines, and to consider whether any, and if so what, amendments are required." The Committee was engaged throughout the year on the work committed to it, and its report may be expected towards the close of the present year, 1910.

ASSOCIATION OF MINING ELECTRICAL ENGINEERS—WEST OF SCOTLAND BRANCH

ON November 4th, a meeting of the Scottish Section of this Association was held in the Glasgow Technical College, at which Mr. Alexander Anderson presided.

The chairman, in his presidential address, briefly referred to the increasing application of electricity to colliery work. He therefore considered it necessary for colliery electrical engineers to obtain a better technical education.

The members of their Association principally consisted of (1) colliery managers; (2) consulting engineers; (3) manufacturers; (4) colliery electrical engineers.

Whilst all these members should be conversant with the applied uses of electricity in mines, he considered the colliery manager, with his many responsible duties, was unable to devote adequate attention to the subject. In favouring the advisability of the employment of trained electrical engineers on the colliery staff, or the engaging of a consulting engineer, he considered that the companies would thus obtain best value for the initial expenditure, and the most efficient installations manufacturers offer could then be arranged on their merits by adopting a fair standard of comparison, thereby tending to eliminate apparatus of inferior quality, and such as was not most suitable for the individual requirements of the work.

The consulting engineer should not be a pure theorist, but rather an electrical engineer with experience in colliery work, and thoroughly conversant with the necessity of advising the adoption of electrical improvements where the financial aspect was commercially sound.

It was undesirable to have separate mechanical and electrical engineers in charge of the same plant. It was preferable to have one man duly qualified in both branches, besides being able to attend to himself below ground without the guidance of the roadsman or other miner.

The secretary (Mr. D. Martin) intimated that the branch was now composed of 76 members.

Cumberland Branch of the Association of Mining Electrical Engineers.—A meeting of this branch was held on Saturday, Nov. 19th, at Whitehaven. No formal paper was read, but there was a general discussion as to procedure in respect of papers, and on the scope of the proposed examinations. Mr. Maurice's paper on "Electrically-caused fires and ignition of firedamp" is to be discussed on Dec. 17th.

Association of Mining Electrical Engineers—East of Scotland Branch.—A general meeting of this recently-formed branch was held on November 12th at the Carlton Hotel, Edinburgh, when Mr. H. Gordon Fraser gave an address on the objects of the Association. Mr. C. A. Carlow, of the Fife Coal Co., has accepted the office of honorary president of the branch, and Mr. T. Davidson (16 Rutland Square, Edinburgh) has been appointed honorary secretary.

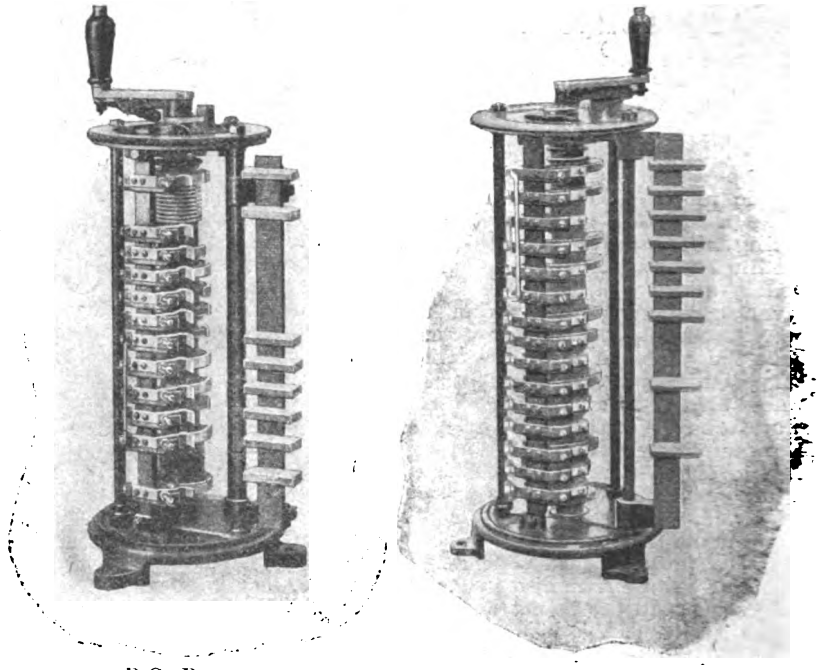
SWITCHGEAR FOR MINES

A PAPER entitled, "Switchgear and other Protective Gear for Use in Mines," was read by Mr. H. W. Clothier (Messrs. Reyrolle & Co., Ltd.), on November 12th, at the Heriot Watt College, Edinburgh, before the National Association of Colliery Managers. He said that we should endeavour to free electricity from the bad name attributed to it in some quarters in the past, by improving the controlling apparatus, and he proceeded to point out various directions in which this was possible, both as regards high tension and low tension work. Several interesting lantern slides were shown, illustrating the improvements in switchboard construction during the last 20 years, especially demonstrating the disastrous effects of having inflammable material on the boards. He expressed the opinion that automatic switches were more trustworthy than fuses; and one instance was recalled of a switchboard being completely destroyed through a fuse arcing instead of blowing when the circuit was overloaded. There was no attendant in the station, so that the terminals were burned away until the oil in the adjoining switch became ignited, thereby being the means of destroying the building and entire plant, and leaving a town in darkness for three days. The duty of a "system engineer" is to see that no stoppage of the supply occurs, and for this purpose he is provided with indicating instruments, and a chart of the entire network of distribution. At the Carville power station, where the high tension network and sub-stations are connected to a ring main, his services have proved of great value. It was specially mentioned that accidents might occur, whatever precautions were observed in the design and manufacture of switchgear, although these would be minimised by observing certain precautions. Several types of up-to-date iron-clad high and low tension switchgear were shown, both for use in mines and generating stations. A number of these were switch-pillars of the draw-out type, in which the complete gear could be drawn out of the high tension connections for inspection. Regarding isolating switches in air, the occasional short-circuiting of the cables causes a magnetic field, which may blow the link out of place unless locking gear is provided.

He classified the most important requirement in switchgear design as follows:—Accidental contact with metal whilst alive must be impossible. The insulation must be able to withstand any excessive pressure that is liable to arrive, even under abnormal conditions. The designs should not allow dust, dirt, moisture, or vermin to diminish the insulation. Fire risks must be eliminated. There should be a minimum amount of cleaning necessary to maintain the gear in a good condition. Parts requiring inspection and cleaning must be readily and absolutely detachable from the gear, to enable such operation to be carried out with safety. The sectional area of conductors must be such as to carry, without deterioration, the maximum overload to which they are likely to be subjected. Moving parts, such as switch mechanisms, must be situated where they can be observed, the chance of switches sticking must be reduced to a minimum. Automatic protection to be included, which will isolate the faulty section without interference with healthy sections. The construction to be mechanically strong in order to resist rough usage and accidental impact. The switches must be capable of breaking, without disturbance to other parts, the maximum power which may instantaneously pass through the switch when acting under the worst fault condition. The simplest construction is required, consistent with economy in operation and low maintenance costs. In cases where automatic protection is installed, more especially for coal-cutter work, it is preferable to make the design such that it is impossible for the men who are working the apparatus to lock off the automatic gear wilfully. Special attention in design is necessary to facilitate the removal of oil-switch tanks for the inspection of switch contacts. All connections and supporting framework to be held by means which cannot shake loose by vibration, that is, split pins, locking nuts, and washers to be freely adopted. Special attention is necessary to good mechanical design in attaching the armouring of cables to switchgear and such apparatus.



Discussion.

Mr. McGuppie agreed with Mr. Clothier in regard to totally enclosing all switchgear and making it fireproof. In his opinion it would only be a matter of time until the system advocated was generally adopted. He had heard that managers proposed to reduce the current inbye, whereas he considered they should reduce the pressure instead, as accidents arising from coal-cutters would then be less frequent.

Mr. Stevenson referred to the analogy between the strain thrown on pipes due to water hammer when a tap was suddenly closed, and the effect when an inductive electric circuit was broken. He agreed that iron-enclosed switchgear was most satisfactory underground, whilst concrete was to be preferred for surface work. Wood pillars should be substituted for iron in oil-break switches.

MOTOR CONTROLLERS

A NEW line of reversing controllers for A.C. and D.C. motors has been introduced by Messrs. A. Reyrolle & Co., Ltd. (Hebburn-on-Tyne). These are especially designed for severe service, as in shipyards, quarries, mines, &c., and on cranes, and are supplied either protected with a simple steel casing or oil-immersed in flame- and explosion-proof cast-iron tanks for use in fiery mines. The accompanying illustrations show a D.C. and an A.C. pattern respectively. The design is very simple, and in all cases the fingers are easily and cheaply renewable. These controllers can be supplied for all voltages up to 650, and in capacities up to 500 h.p. Star-delta switches for squirrel-cage induction motors and controllers with shunt regulators for D.C. motors, are also manufactured in this pattern. Our attention has also been drawn to the special advantages of the firm's double-revolution drum-type starter regulators, which, we understand, are selling in large quantities. This pattern was described and illustrated in Electrical Engineering, May 6th, 1909, Vol. V., p. 417. It is standardised in sizes up to 50 h.p., 500 volts, but larger sizes can be supplied.

THE POWER EQUIPMENT OF COLLIERIES

THE above was the title of the inaugural address of Mr. S. Mavor, as Chairman of the Glasgow Section of the Institution of Electrical Engineers. The introduction of electric power had been, he said, an inestimable boon to many industries, but to none were its services of greater value than to coal mining. In recent years, the demand for power at collieries had been greatly augmented owing to acceleration in the rate of winding, increased pumping, a higher standard of ventilation, the replacement of manual and horse haulage by mechanical means and the introduction of coal-cutting and conveying machinery at the face. Screening and washing plants were also extending, particularly in Germany, where also the by-product recovery plants that had been developed in connection with coke ovens had introduced new conditions.

Increased attention was now being paid to the cost of power with the increased magnitude of the plants and the greater stress of competition, and the electrical power engineer was becoming a more and more important man in mining work. Mr. Mavor drew some comparisons between German and English power plants, pointing out the more expensive and elaborate nature of the Continental generating stations, &c. As with the material, he said, so with the *personnel*; the colliery manager's standard of qualification was much higher in Germany than in this country, and he had at his command a highly educated staff of mechanical and electrical engineers. The capital expenditure in Continental collieries often amounted to £1 per ton of coal produced per annum. There was much of suggestion in the Continental practice, but there was at the same time much of warning.

In speaking of recent development of power plant, he remarked that turbine machinery of to-day owed its position to association with electric generators and motors, but was about to repay handsomely its debt to the electrical engineer by enormously increasing the demand for turbo-generators and high-speed motors. He then spoke of the great developments taking place, unfortunately more on the Continent than in this country, in turbo-pumps, turbo-blowers, and turbo-air compressors. In many foreign stations, not a single piece of reciprocating machinery was to be seen. He referred to the economies that had been brought about by the mixed-pressure turbine, but remarked on its tendency to "eat its own tail." An ample supply of exhaust steam from uneconomical engines might at first be available, but the electric motor had a way of displacing these engines, and as the electric load increased, the supply of exhaust steam diminished.

As regards the principal power application in a colliery, that of winding, Germany had given the lead in electrical methods, but the cost of equipments and restrictions imposed by power companies as to load fluctuation, had hindered its adoption here. With regard to pumping, he again emphasised the rapid supercession of the reciprocating pump by the turbo-pump. Turbo-air compressors were also being now built on the Continent up to 20,000 h.p. in single units. Electric motors had also gone far to displace other methods in underground haulage, but he uttered a word of warning against the use of too high-speed motors for this class of work. He thought that the rope haulage system of this country was more economical than the underground locomotives which are widely used on the Continent and in America. With regard to air-driven percussion tools, the electrically-driven compressor inbye had led to great gains in economy, particularly where a closed pneumatic circuit for individual machines had been used. Attempts to use inbye compressors for working long wall coal-cutters had, with one or two qualified exceptions, failed, owing to want of appreciation in the difference between the conditions. He suggested various ways by which better efficiency could be obtained, but thought that the arrangement had only a very limited sphere of application.

Coming to more general questions regarding electricity in mines, Mr. Mavor thought that the recent prosecutions for alleged infringement of the special rules had had a salutary effect. He awaited the report of the special committee on these rules with interest. One great difficulty was in the definition of flame-proof apparatus; more experiments were wanted on the subject, and he urged that the Home Office should encourage the testing of actual apparatus either in the experimental gallery at Woolwich Arsenal or that of the Association of Colliery Owners at Altofts, in Yorkshire. Fortunately for Scotland, the dangers from explosion were less than in other districts, and the restrictions in the use of electricity in their own mines need not be so strict as elsewhere. The Chairman then dealt further with the subject of compressed air transmission, and, in conclusion, put in a strong plea for the more extensive adoption of the long-wall system of machine mining, which could effect economies on a much larger scale than any amount of attention in the amount of fuel consumed for power purposes for the same extra capital expenditure.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during November.

Nov. 3rd.—Monthly supplement on ELECTRICAL ENGINEERING IN MINES, opening with a critical article on the Association of Mining Electrical Engineers, and containing an illustrated description of the electrical equipment of the Oakdale Collieries. Notes are given on mining electrical patents of interest published during October. ELECTRIC WINDERS

ON Monday, November 21st, a meeting of the Newcastle Local Section of the Institution of Electrical Engineers was held at Armstrong College to discuss electric winders. Mr. C. Faraday Proctor took the chair. In opening the discussion Mr. J. G. Wilson pointed out that starting and stopping occurs once or twice a minute—less or more, according to the depth of the shaft. The net power exerted in raising the coal is relatively small, as the mass to be set in motion is 10 to 20 times as great as the coal lifted. At Harton Colliery the coal lifted at each wind is four tons, requiring a power, including friction, windage, &c., at full speed of about 700 h.p., but the maximum power required in acceleration is 1,500 h.p., as the total mass moved is 72 tons, and the rate of acceleration over three feet per sec. per sec. Mr. Wilson compared this with an electric train on the North-Eastern Railway, where 58 tons accelerated at one foot per sec. per sec., reaching a speed comparable with that of the pit-cage, takes 250 h.p. during acceleration. Some electric winders have speeds nearly double, and accelerations half as big again as at Harton. The cost of the plant increased very rapidly with increased speed of wind. The load factor of electric winders is very low; in the Newcastle area, on the basis of maximum power, half the total power employed in collieries is in winding; if considered on the basis of annual consumption, supposing all the colliery power work were done electrically, only about a quarter of the units consumed would be used in winding. The annual saving due to electric drive is proportional to the power averaged over the whole year, while the capital expenditure is more nearly proportional to the maximum power exerted.

Turning to the question of type of motor, Mr. Wilson stated that with three-phase motors, starting involves mechanical devices in connection with the liquid rheostat of the rotor (either to withdraw the electrodes or to pump the electrolyte), and as the time occupied has to be kept in practice to five to fifteen seconds, in large winders it can only be effected by an auxiliary motor. The power-factor at starting is low, especially if the motor is direct-coupled. When a D.C. motor is employed, it receives power through a motor generator with Ward-Leonard control. The large rheostatic loss is avoided, and a finely regulated control over the whole speed-range is effected. Automatic overwinding devices are easily applied, and the control can readily be made fool-proof. The disadvantage is that three machines involving increased first cost, losses, and risk of accident, are required. Where the speeds and accelerations employed are low, the motor-generator losses approach the rheostatic loss of the three-phase system, and these losses become relatively more important if the motor-generator has to be kept running for any time beyond regular working hours to wind men, &c. In the speaker's opinion winders of small size should be three-phase unless a D.C. supply is already in the colliery. From 200 h.p. upwards the D.C. winder has considerable claims. If a synchronous motor is used instead of an induction motor for the motor-generator in the Ward-Leonard system, the supply can be taken at unity power factor.

Mr. Wilson then dealt with flywheel systems. For a local supply the extra cost and complication is justified as the cost of extra plant to supply the peak during acceleration is more than the cost of the flywheel plant. For power-in-bulk systems the question is a matter for collaboration between the colliery and supply authority. The advantages of geared *versus* direct drive are obvious respecting first cost and facility for repairs. With double helical gearing 98 and 99 per cent efficiencies have been established. As with deep shafts nearly half the total mass to be accelerated is on the drum itself, doing away with this, and substituting a pulley of the Koepe or similar type, carrying only one convolution of rope, is a decided advantage. The Koepe pulley involves balancing the tension in the ropes connected to the cages by a balance rope, however.

Factors determining the economic advantage of electric as against steam winding are the value of coal available at the pit, and the cost of current available. The Eight Hour Bill has had a favourable effect by lengthening the working hours. Referring to the method of retaining the steam winder and installing exhaust steam generators for supplying the rest of the colliery power, Mr. Wilson pointed out that where cheap power was not available this deserved consideration, but was costly in capital and upkeep.

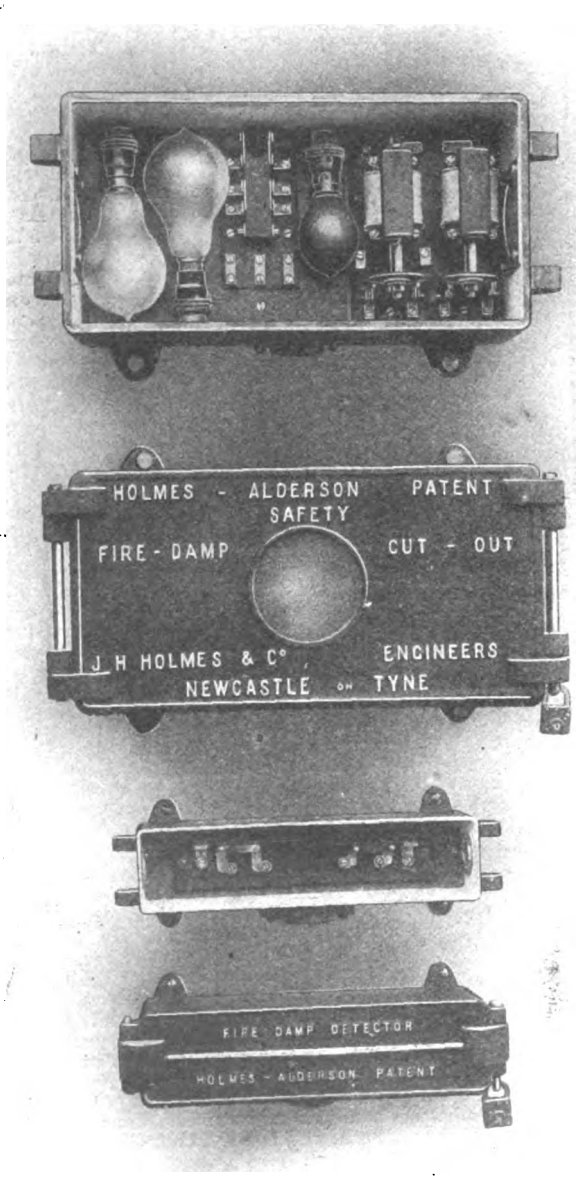
In a written communication, Mr. G. J. Hooghwinkel stated that the results obtained at the Great Western Colliery with their electric winder had fulfilled the expectations of the management. It had been regularly in operation for two years without stoppages due to breakdown. At one time a little trouble was experienced with the flywheel set, and this was shut down and winding continued without it. Although the current was taken from a power company on the basis of a fixed payment on the maximum demand for each month plus a small charge per unit (the whole charge totalling about ½d. per unit), the flywheel set was only used occasionally, as the fluctuation without the flywheel set was not excessive. The load factor of the engine was about 12 to 15 per cent., and the cost of coal wound was under 2d. per ton raised, including capital charges. Three-phase winders with liquid control gear, and supplied from turbine plant, could often be installed without flywheel sets. Messrs. Brown, Boveri had installed a plant lifting 7½ tons of coal thirty times per hour in a shaft of 800 yards depth at a colliery in Silesia. This comprised a turbine driving a D.C. generator for the winding motor (controlled on the Ward-Leonard system), and a three-phase generator for the colliery supply. The demand on the winding motor varied between 565 and 1,400 h.p., the turbine sets gave 1,740 kw. and 625 kw. respectively. The total first cost without boilers was £15,000. With a load of 115 tons of coal per hour, or half the useful load for which the engine was designed, figures of 15·5 lbs. of steam per unit, and 17 lbs. of steam per useful shaft h.p., were obtained. The speed variation was less than 2 per cent. between full load positive and full load negative on the winding generator, and the three-phase generator could not be thrown out of step. He had recently calculated the figures for a winding plant of about double the size of the one described for the same depth. The cost of the complete installation with Ilgner equaliser, and current at ½d. per unit, was £19,000, while with direct turbine drive it was £32,000. The cost per ton of coal wound in the first case was 2·7d., and in the second 1·7d.

Mr. W. C. Mountain (Ernest Scott & Mountain, Ltd.) thought that it was worth considering whether one could utilise the waste steam from existing engines. From the point of view of simplicity the three-phase winder with a slow-speed motor, preferably with plain copper bars inserted in mica tubes, had great advantages. In the Ilgner system there were several electrical links in the chain of operations, any one of which could go wrong. With regard to the question of cost, steam winders could work at a lower figure than that quoted by Mr. Hooghwinkel. The highest cost of winding by steam winders was 16s. per 100 tons. He did not see how electric winders were going to compete with steam winders unless the coal from the collieries was worth at least 10s. With regard to machine-cut helical gears, he had installed gears up to 100 h.p. running in oil perfectly silently and working satisfactorily. The Koepe endless rope wheel depended for its action on the grip of the rope on the wheel, and if the rope slipped the cages might break loose and go to the pit bottom. The use of a balance rope had in one instance caused a saving of 15 per cent. in coal consumption.

Mr. Woodyatt (Siemens Bros., Ltd.) said that the advantages of a simple direct drive with rheostatic control were that the first cost was less than in either the Ilgner or Ward-Leonard systems, and much less floor space was required; but the efficiency was not so good, and the control and regulating gear for large plants became unwieldy because the main current was dealt with. In South Africa existing steam winders had been converted to electric drive by coupling up a three-phase motor with rheostatic control. For new winders of medium and large size D.C. motors with Ward-Leonard control were supplied. His firm had in hand two large winding engines of the Ilgner type where the peak h.p. reached about 1,000. By heavy flywheels the demand from the mains would never exceed 400 h.p. With regard to the Koepe pulley, in small plants the question of the drums was not serious, but from the point of view of first cost and actual running expenses, heavy conical drums on big winders were a matter of great importance. The use of Koepe pulleys on large winders had made such plants compare favourably in capital cost with steam winders, as owing to the lighter weight to be accelerated the size of the winder motor and converter set could be reduced. It was impossible to get such high accelerations as with a drum, but there were several Koepe pulleys working satisfactorily with a hoisting speed of 66 ft. per second.

Dr. Rosenberg (British Westinghouse Electric & Manufacturing Co.) said that it was difficult to understand why the Koepe pulley had not been introduced in this country when its success on the Continent was considered. The climatic conditions could not be the cause, as the rope was always wet and greasy. An installation including a Koepe pulley would shortly be in operation about 40 miles from Newcastle, in connection with a plant winding 900 tons of coal daily from a depth of 800 feet; the machine was being installed by his firm on the Ward-Leonard system.

Mr. G. Stoney (C. A. Parsons & Co.) advocated the use of mixed pressure or exhaust steam turbines, using the waste



Digitized by Google

steam from the winding engine. With regard to double helical gears, his firm's experience had been very satisfactory. The steamship *Vespasian* had a turbine of 1,600 revolutions connected by such gear to a propeller shaft running at 80 r.p.m., about 1,000 h.p. being transmitted through the gear. The vessel had made a considerable number of trips from the Tyne to Rotterdam without any noticeable wear on the gear.

The meeting was adjourned to complete the discussion.

FIRE-DAMP SAFETY CUT-OUT

MINING inspectors and others have repeatedly referred to the need for an automatic device to detect and indicate the presence of fire-damp and to cut off the current from electrical apparatus within the danger area before the percentage of fire-damp in the air reaches a dangerous amount. To supply this need an ingenious apparatus has been placed on the market by J. H. Holmes & Co. (Newcastle-upon-Tyne), under the name of the Holmes-Alderson fire-damp safety cut-out. The device will work with 2 per cent. of fire-damp, but can be adjusted to operate at any larger per-

FIRE-DAMP SAFETY CUT-OUT.

centage. The apparatus is contained in two separate cast-iron boxes as illustrated.

The detector itself consists of two compound metal strips, *E* and *F*, normally out of contact. Below these are coils of thin wire, of silver and platinum respectively. These coils are in series, and normally heat up both strips equally, so that they do not touch. Variations of temperature or voltage affect both strips equally. Should fire-damp be present,

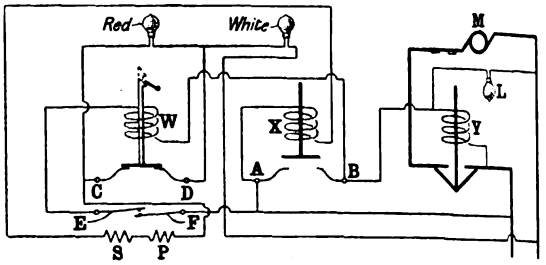


DIAGRAM OF CONNECTIONS OF FIRE-DAMP SAFETY CUT-OUT.

however, the platinum coil will increase in temperature due to catalytic action, and the strip *F* will bend up and close the circuit. This results in the solenoid switch, *W*, lifting and putting the red lamp in circuit by opening the short-circuit at *C*, *D*, and at the same time cutting down the current. Although the coils cool and the contact separates, the plunger of the solenoid *W* is held up by a catch. The air enters the detector box through openings covered with fine wire gauze as in a safety lamp.

In order that the device shall cut off the supply, a second solenoid switch, *X*, is provided. In its off position this closes two contacts, *A* and *B*, which are connected to the motor switch-gear in such manner that, when closed, they will cause the current to be cut off. This can be effected by connecting the two contacts, *A* and *B*, to the "no-voltage" release coil of the starting switch, but as it is possible for the attendant to switch current on again, it is recommended that a solenoid controlled main switch be employed, as shown in the diagram. If this solenoid switch be enclosed in a case, the attendant cannot switch on again until the solenoid *W* has been reset by the person having the key of the case. It will be seen that the solenoid *X* is in series with the heating coils and the two lamps. The core of this solenoid will remain lifted so long as there is any supply, and thus leave the two contacts, *A*, *B*, disconnected. Should gas be present and the strips come into contact, the reduction in the current due to the red lamp coming into circuit will cause the core of *X* to fall and make contact across *A*, *B*, and short-circuit the solenoid *Y* of the main switch. Although the strips separate, the main solenoid switch cannot be closed again until the red lamp has been short-circuited again by releasing the catch of the solenoid switch *W*. A switch is provided in the detector to short-circuit the heating coil under *E*, so that the apparatus may be tested periodically. The closing of this switch will cause strip *E* to cool, and come in contact with *F*, and thus operate the cut-out gear. If required, the apparatus can be supplied in a simpler form, for merely giving an indication that gas is present.

Miners and Electric Power.—At a representative meeting of the Federated Board of Miners, Enginemen and Firemen of Derbyshire and Nottinghamshire, held at Chesterfield on Nov. 5th, several speakers protested against inexperienced persons being in charge of electrical installations in mines, and suggestions were made that the electrical apparatus employed at some collieries was cheap and inefficient. A resolution pledging the Association to use its best endeavours to obtain proper safeguards in the new Miners' Act was passed. At a meeting of delegates from the Miners' Associations of South Yorkshire, resolutions were discussed, but not passed, relating to inspection and the use of electric power in mines. One resolution was against the supply of electric power beyond the safety zone in any mine.

Mining Patents.—The only patent specification published during the past month of particular interest to mining electrical engineers was No. 24,371 of 1909, by W. Alderson and J. H. Holmes, relating to the fire-damp detector and safety cut-out described on this page.

STREET LIGHTING

MR. HAYDN T. HARRISON, in his Paper entitled "Street Lighting by Modern Electric Lamps," read before the Institution of Electrical Engineers in London on Thursday last, and in Manchester on the preceding Tuesday, remarked that the improvements connected with electric lamps which have taken place within the last two years have placed electrical engineers in a much improved position as regards competition with gas. Arc lamps were now available which give their maximum candle-power in the direction most suitable for street lighting, and for small units tungsten lamps were of great value, particularly where it was a question of replacing gas by lamps of about the same candle-power, and it was not advisable to scrap existing posts and lanterns. He instanced the case of Marylebone, where 1,964 gas lamps, most of them equipped with one or two mantles requiring 4¼ cu. ft. per hour, and giving about 45 and 76 c.p. respectively were replaced by Osram lamps of the following sizes :—

	Measured candle-power At 20°.	At 10
335 two 80-watt lamps	135	220
491 two 55- ,, ...	75	130
1,138 two 35- ,, ...	55	100

These were in special fittings designed by the author, involving the use of a white inverted wedge reflector with suitably curved sides, increasing the available candle-power near the horizontal to about double that of the lamps only, and to six times the vertical value. Other features of the fitting (see ELECTRICAL ENGINEERING, Aug. 25th, p. 547), were the placing of the large white surface of the reflector close up to the filaments, with no intervening lampholder, which reduced the effect on the eye of the high intrinsic brilliancy of the lamp, and the anti-vibration support. The conversion of the 1,964 lamps was carried out for £5,788, against estimates of £8,000, and the working expenses amounted to

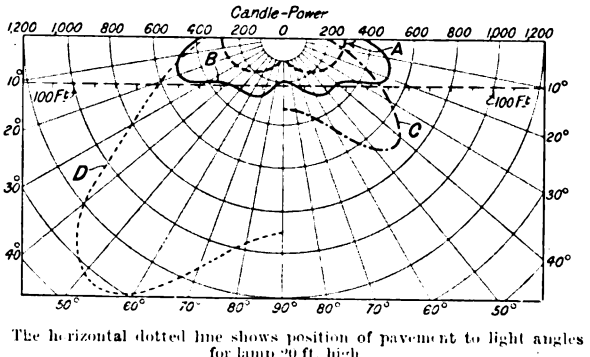
C. 12-amp. Excello dioptric and clear globe.

FIG. 1.—CURVES FOR FLAME ARC LAMPS, SHOWING EFFECT OF DIOPTRIC AND OUTER GLOBES.

£7,350 per annum, or £3 15s. per post, made up as follows :—Electrical energy at 1·42d. per unit, £3,950; Lighting, extinguishing, cleaning, painting, &c., £1,570; lamp renewals, £1,230; repayment of cost of electric fittings in three years, £600.



The total cost of lighting these lamps by gas had been £8,818 per annum. It must also be noted that the total candle-power of the gas lamps, viz., 109,000, was increased by the adoption of electric lamps to 146,000 at 20°, or 193,883 at 10°. The price of 1·4d. per unit was not based on costs of generation, but was arrived at in order to repay the cost of services at an early date. The cost per mile of street works out at £384 per mile for main thoroughfares, and £204 per mile for side streets. These figures, if energy is taken at 1d. per unit instead of 1·4d., reduce to £356 and £130 respectively.

The Paper then gives some details of the arc lighting in Oxford Street. At the time this street was changed from gas to electric lamps the most efficient lamp available for the purpose was the converging carbon flame arc lamp. This lamp was therefore used, the globes being of the opalescent type recommended by the makers at that time. Two such lamps were erected on centre poles where favourable, which were at distances of nearly 200 ft.; this resulted in a minimum horizontal illumination of 0·11 c. ft. The cost works out at £800 per mile per annum.

Since that time the arc lamp-makers have turned their attention to altering the distribution of light from flame lamps in order to make them more suitable for street lighting, and the excellent results obtained by the dioptric globes as employed in Regent Street and elsewhere are shown in Fig. 1, which is from tests by the author. Tests of other lamps, including the Crompton Blondel and the Jandus Regenerative, which also show good results at small angles of depression, taken by Mr. J. T. Morris, are also referred to in the Paper. The values of the candle-power per watt at 10° to 15° from the horizontal vary from 0·8 per tungsten lamp, up to 6·5 for an Excello lamp with dioptric and clear globe, and 5 to 8 for the Jandus regenerative lamp. In speaking of high-power gas lamps, it is mentioned that a nominal 1,500 c.p. Keith lamp, which gave 780 c.p., with 23 cu. ft. of gas per hour, on test, would require to be supplied with gas at 7d. per 1,000 cu. ft. in order to produce the same light at an equal cost as a flame arc lamp giving 5 c.p. per watt at 1d. per unit. Comparisons were then made between the cost of lighting by open arcs and by tungsten lamps. In a typical case of open-arc lighting the minimum illumination was 0·05 c. ft., and the cost per mile per annum £880, against the minimum illumination of 0·08 c. ft. obtained for £414 per mile with tungsten lamps in Marylebone. In Croydon groups of three 100-watt Osram lamps were adopted in special lanterns on existing arc lamp posts 20 to 22 ft. from the ground, 73 yards apart, and giving a distribution of light as shown in one of the curves in Fig. 2. The minimum direct illumination was found to be 0·041 c. ft., as against 0·024 with 10-amp. open arcs, and the cost per mile worked out at £200. The minimum illumination in the same streets when lighted by gas had been 0·0036 c. ft.

Series arc lamps could easily be replaced by groups of tungsten lamps, and for this purpose the author has devised a combined lantern and cut-out by the action of which a spare lamp placed in a conspicuous position in the globe comes into operation in the event of any of the other lamps failing. Mr. Harrison then briefly mentioned the case of Harrogate, where Mr. Wilkinson has replaced the arc lamps by four 100-c.p. tungsten lamps, arranged on spreading arms at a considerable height, the result being excellent, both as regards illumination and appearance.

Reverting to the subject of reflectors, the author again emphasises the importance of minimising the glare due to high intrinsic brilliancy. Mr. Pragnall had sought to diminish this by fixing thin sheets of metal with white surfaces, adjacent and radially to the light source, so that it is

The horizontal dotted line shows position of pavement to light angles for lamp 20 ft. high.

seen in the midst of an illuminated white surface, and not against the dark sky or distant surroundings, while at the same time practically no light was lost owing to the surfaces being thin and radial to the lamp. Some curves showing the loss of light with the opalescent globes often used with arc lamps were also shown.

Mr. Harrison then commented on the specification for the Westminster Street Lighting, by which the rated candle-power of the lamps was the mean of that at 50° and 20°. The new gas lamps which had been put up gave about 1·5

Digitized by Google

times more candle-power on the 20° ray than on the 50° ray, which was, of course, a ratio in the right direction, but not sufficiently so to prevent the illumination adjacent to the post being twenty times that of the minimum illumination, whereas with the small gas units displaced it was only 16 times as great, and if the height of the small units had been that of the present units it would only have been twice as great, which would have come under the head of even illumination.

The subject of cost of public lighting was then discussed at some length. All-night street lighting had a load factor of 40 per cent., and he argued that a remunerative price per unit may be taken as 1d. for large undertakings, and 1·5d. for small undertakings, which included, as in the case of consumers, the cost of service to the ordinary distributors, but not of fittings, &c. For the cost of lamp renewals and of lighting, cleaning, extinguishing and repairs, he gave the figures in the following table :—

Total c.-p. of unit.	Cost of renewals per c.-p. per annum. Without reflector. d.	Cost of renewals per c.-p. per annum. Special lantern. d.	Cost of lighting, extinguishing, repairs, &c., per annum. d.	Capital charges per annum. £	Total cost per candle-power per annum. Without reflector. d.	Total cost per candle-power per annum. Special lantern. d.
50 (Tungsten)	2·4	1·3	4·00	3	10·50	7·0
100 ,,	1·8	1·2	2·00	3	8·20	5·0
200 ,,	1·2	1·0	1·00	5	7·00	4·3
300 ,,	1·2	1·0	0·66	5	6·66	4·1
400 ,,	1·2	0·8	0·50	5	6·50	3·8
500 ,,	1·2	0·6	0·40	5	6·40	3·5

	Cost of carbons, trimming, &c. d.	£	d.	d.
300 open arc	3·6	20	10·20	—
1,000 flame arc	2·0	20	3·65	—
3,000 flame arc (dioptric and clear outer)	0·7	20	1·32	—
2,000 to 4,000 regenerative flame	0·3 to 0·15	20	1·0 to 0·8	—

A table follows of the candle-power necessary to obtain a minimum illumination of 0·1 c. ft. for various distances apart of posts from which the large reduction in total candle-power necessary to produce the same minimum degree of illumination with small units of light placed close together, and the effect of height of the lamps on horizontal illumination was very noticeable. Thus when the lamps were spaced at 30 yards only one-ninth of the total candle-power was necessary to give the same result as when they were placed 100 yards apart; therefore, unless a lamp giving a very high candle-power at low cost be used, the closer spacing would be the cheaper alternative. Again, converging flame lamps (unless provided with dioptric globes) when erected at 70 yards, give illumination at the same cost, equal to small units of light placed between 40 and 50 yards apart, provided, of course, the small units of light are fixed at the same height.

In this connection Mr. Harrison pointed out an objection to horizontal illumination as the gauge of street lighting in that the increase in the height of the lamps would not in any way increase the illumination of pedestrians and vehicles or other vertical objects; it was also misleading owing to the introduction of the cosine factor. On the other hand, the specifying of minimum horizontal illumination encouraged raising the height of the lamps, but the factor of direct illumination covered this point when the maximum and minimum are stated. The difference between the maximum and minimum illumination at any point of a street should be as small as possible. The importance of the diversity factor of illumination could not be overrated. Mr. A. J. Sweet, in his Paper read before the Franklin Institute of Philadelphia, stated that a ratio of maximum to minimum (illumination) of 4 to 1 was permissible, and pointed out that the present factor more frequently fell between 100 to 1, or even 500 to 1. For example, in Oxford Street, using flame arc lamps, it was 99 to 1; whereas in Regent Street, where the same type of lamp was used, but with a dioptric globe, this was reduced to 13 to 1. In Victoria Street, the latest example of gas lighting, it was 20 to 1, whereas in the important streets of Marylebone it was 6 to 1.

In conclusion, he wished to warn engineers that good illumination, though the prime object in street lighting, is not the only feature to be considered. Careful thought must be given to obtaining as even illumination as possible; and if high intrinsic brilliancy is carefully avoided the result would be in every way satisfactory, not only to the lighting authorities, but also to the general public.

Discussion in London.

Mr. Frank Bailey (City of London Electric Lighting Co.) expressed the opinion that most of our street lighting was very meagre and unsatisfactory, the standard of illumination under modern conditions of fast-moving traffic being very little better than it was many years ago. Electrical engineers had difficulty in obtaining the opportunity of showing what they could do; in the City of London he had had to beg to be allowed to demonstrate what was now possible with electric lighting. The absence of any intelligent specification was remarkable, and many borough engineers knew very little about lighting. It did not seem to be recognised that very much better results could be given with electric lighting now at the old prices, but at the same time he did not think the question of cost should be the predominant factor so much as the needs of the public. He put forward the new centrally hung arc lamps in Cheapside as a specimen of what a properly lighted thoroughfare should have. Whilst agreeing with the great advantages of metal filament lamps for side-street lighting, he preferred flame arc lamps of high candle-power for important thoroughfares.

Mr. C. P. Sparks (County of London Electric Supply Co.) suggested that the Institution would do a great deal of good if they appointed a committee to draw up a standard specification for street lighting, which, even if not adopted generally, could be taken as an authoritative basis. With the exception of a few isolated cases, street electric lighting had been mainly in the hands of municipalities, and most of it was still with open type arc lamps. On the prices of the old contracts there was ample margin to put in more modern lamps and give a standard of illumination which would compare with modern gas. The price of 1d. per unit mentioned in the Paper he thought was on the high side, and until supply undertakings were prepared to offer energy at a lower rate, there was not very much chance of wresting the bulk of public lighting from the gas companies.

Mr. A. H. Seabrook (Borough Electrical Engineer, Marylebone) disagreed with Mr. Sparks on the question of price, and mentioned that at this charge his Council were making a saving of £3,000 per annum in their street lighting bill. Mr. Harrison had mentioned £880 per mile for arc lighting as a good figure, but at Marylebone it was done for £800 on a scale that had been criticised. He thought that the glare caused by dioptric globes, such as had been used in Regent Street, made the system used in Oxford Street preferable. Where streets are wide enough he preferred centre columns to side columns for arc lamps, and would favour centrally hung lamps where he could get means for carrying this out. A good deal of the light from arc lamps on the footpaths was wasted on the buildings.

Mr. W. A. Vignoles (Borough Electrical Engineer, Grimsby), in reference to the Local Government Board and loans for street lighting, said he had found no difficulties put in the way if the whole scheme was worked out by the time the Inspector came down to hold the inquiry. He had received a loan for ten years for posts, fittings, and services, although the term of years for ordinary services was 15 years, and it used to be 25. He disagreed with the author in taking the minimum horizontal illumination as the standard, and thought the vertical would be better. He asked the author why two lamps were used in the Marylebone lanterns. Probably it was so that there would always be one lamp alight should there be a failure, but it surely increased the cost of renewals. Were there any fuses in the Marylebone lamps except those at the top of the posts, as this seemed to him an undesirable place to have them when he was considering the change over at Grimsby. He thought gas lanterns with a white reflector in the top were the very best form for street electric lighting. His figure for the change over at Grimsby was a little lower than that at Marylebone, and by charging one penny per unit he had a margin which was quite satisfactory for the department.

Mr. A. P. Trotter said that the diversity coefficient was an important matter, and referred to the form of dioptric globe that he had designed about 30 years ago, the effect of which was similar to the present holophane globe: it distributed the light both horizontally and vertically; but he had found that it was a mistake to distribute the light too uniformly, as people preferred a certain amount of variety in the illumination. Given a certain minimum and a certain diversity factor, there was a great deal to be worked out by the engineer, especially in the height of posts and size of lamps. The great problem now seemed to be the side streets, where a great deal more skill was required to get a good illumination.

Mr. L. Gaster supported the suggestion that a standard specification should be drawn up, and mentioned that a committee with this object in view had already been appointed by the Verband Deutsche Elektrotechniker.

Mr. W. R. Cooper asked what was the author's meaning when he used the term "candle-power," as sometimes he used it in relation to light from reflectors and dioptric globes (where the law of inverse squares did not hold). He rather deprecated the use of the term "diversity factor," as there was the possibility of confusion with other kinds of diversity factors.

Mr. C. M. Shaw (Borough Electrical Engineer, Worcester) said he was not satisfied with the use of old gas lanterns in

Digitized by Google

Worcester, and designed others when he changed over from gas to electric lighting. He thought they would have to offer very much lower prices than the present suggestions to make any considerable progress in replacing gas. He was satisfied with the £120 per mile that he got for side-street lighting, against the £204 mentioned in the Paper. In Worcester he got out a scheme for lighting streets from the tramway posts, and was able to do it for £116 per mile, or £195 including all capital charges. They did it all out of revenue, and did not trouble the Local Government Board about it.

Prof. J. T. MORRIS (East London Technical College) spoke of some interesting experiments confirming the author's view that illuminated white surfaces near the lamp diminished glare by actual measurements of the contraction of the retina.

Mr. C. NEWTON RUSSELL (Chief Electrical Engineer, Shoreditch) briefly referred to the street lighting which is being carried out in that borough, where some 400 Osram lamps had been installed.

Mr. K. EDGCUMBE thought it would hardly be possible for the Institution to take in hand the drafting of a standard specification without calling in representatives from the gas industry and also the surveyors.

Mr. H. BOOT advocated the use of centrally hung lamps for side-street lighting. In his opinion the price put down for electrical energy for street lighting was much too high, and from figures that he had worked out he was of the opinion that it could be supplied at very little more than ½d. per unit. In one town with which he was connected they had taken on a contract to light the whole place for five years, and although this involved laying new mains, the policy was justified by the number of new consumers obtained.

Mr. J. S. DOW spoke as to the desirability of recognising the avoidance of glare with the production of uniform illumination.

Mr. HARRISON replied briefly to some of the points raised. He thought that centre lighting was bad for drivers, who frequently had the lamps in their line of vision. The standard specification was an important matter, but he did not think electrical engineers could work alone in connection with it. They could not ignore the gas interests nor the borough surveyors. Unfortunately the latter had a very imperfect knowledge of illumination. The Marylebone lamps were introduced at a time when they had to put two lamps in series, but the pairs of lamps undoubtedly gave a better effect.

DISCUSSION IN MANCHESTER.

Mr. S. L. PEARCE (Chief Electrical Engineer, Manchester Corporation) thought that in Marylebone pairs of 230-volt lamps in parallel would have been preferable to lamps in series. He did not see why there should be any difficulty in allocating capital charges or mains, and he wanted a little more explanation of the way the Marylebone costs were worked out. The dioptric globe had further advantages to the improved distribution of light, in the better ventilation and the avoidance of etching the outer globe by the chlorine liberated. The price they were getting in Manchester was 1¼d. per unit, including capital charges, maintenance, and current. He rather objected to the use of the term "diversity factor" for the ratio of maximum to minimum illumination.

Mr. H. W. ANGUS (Borough Electrical Engineer, Eccles) said that in Eccles they had about 300 posts, each fitted with a 55-watt 100-volts tungsten lamp in a well-glass fitting, with inverted reflector, mounted upon a swan-neck bracket. The approximate cost of the post, fitting, and lamp, erected, was £2 12s., and the approximate cost of the service, including the tee joint, was £1 5s. 6d. There were 40 posts per mile, and the cost per mile was approximately £100 per annum. They got a price of £2 8s. 6d. per post per annum, which includes the electrical energy supplied, lamp renewals, and attendance. This sum was based on the cost of energy at 1·92d. per B.T.U., but it also provides for four lamp renewals. Actual results obtained have shown that the average life of these tungsten lamps is over 2,000 hours. The lamp renewals per annum have therefore worked out at a little over 1½ lamps per post.

Mr. A. G. COOPER (Borough Electrical Engineer, Colne) made some remarks upon the burning hours of enclosed lamps, and Mr. J. Frith referred to the relative penetration of fog by different illuminants.

Mr. F. SELLS (General Electric Co.) was very appreciative of the Paper, but wished there had been more in it about the smaller towns. With regard to the relative life of high- and low-voltage tungsten lamps, his personal experience was that whilst low-voltage tungsten lamps might have a longer average life than high-voltage tungsten lamps, the series lamps certainly had not got a longer life than the parallel lamps, the most apparent reason being the difficulty of matching the series numbers.

Mr. H. C. CREWS and Mr. MOON also spoke, and Mr. J. S. PECK (British Westinghouse Co.) made some remarks from the chair, pointing out that the light from two adjacent lamps should be taken in account in working out the minimum illumination. He thought, however, that this was an unsatisfactory criterion. He had worked out that with tungsten lamps 1·4d. per unit was equivalent to gas at 10d. per thousand cu. ft.

Mr. HARRISON replied briefly. He had omitted to include enclosed arc lamps in the Paper because as made at present their light distribution curves do not give high efficiency for the purpose. He agreed that horizontal illumination was not everything, but as it embodied all the other factors it was the most convenient unit for comparison. The reason the Marylebone lamps were put in series was because at the time they were put in, 240-volt lamps of small enough size to be used in parallel could not be obtained.

THE PRICE OF ELECTRICAL ENERGY FOR TRAMWAYS

MR. ROBERT HAMMOND has now issued his award determining the price which the Paisley District Tramways Co. is to pay the Corporation for electrical energy for working the tramways. Under the Paisley District Tramways Order of 1901, the following schedule of prices was fixed for the following seven years, but this period was subsequently extended to nine years :—

2d. per unit for the first 200,000 units per annum.
1¾d. per unit for the next 100,000 units per annum.
1½d. per unit for the next 100,000 units per annum.
1¼d. per unit for all additional energy.

The period of nine years expired on August 16th, 1910, and as the Corporation and Company could not agree to a new scale of charges, the matter was referred to Mr. Robert Hammond as arbitrator to determine, it being agreed that the expenses of the arbitration should be shared equally. The arbitration proceedings were reported in our issues of October 13th and 27th, and November 3rd, 1910.

Mr. Hammond's award is that the rates to be paid by the Company to the Corporation for a period of seven years from August 16th, 1910, shall be *a fixed sum of £4 15s. per kw. per annum of the maximum power delivered to the tramway feeders, and, in addition, the sum of 0·475d. per unit for all units delivered to the tramway feeders and metered at the generating station.* The maximum power delivered to the tramway feeders during the year shall be taken to be the average power delivered to the tramway feeders during the period of thirty consecutive minutes in which the electrical energy supplied to the Company is a maximum for the year.

Mr. Hammond states that in fixing the above prices he has been guided, among other things, by the cost of fuel for the year ended May 15th, 1910. During that year, according to the accounts of the Corporation, the cost of "coal and other fuel" was £3,294 15s. 3d.; the number of units generated was 3,035,698; the quantity used on the works, 408,936 units; and the quantity delivered to the feeders [or the whole Corporation supply, including that delivered to the tramway company] was 2,626,762 units, the resultant cost per unit delivered to the feeders being 0·301d. He decides, therefore, that the 0·475d. per unit mentioned above is to be increased or decreased, as the case may be, by an amount equal to the difference between the actual cost per unit delivered to the feeders of "coal and other fuel" to the Corporation in any year, and 0·301d. Pending the determination of the amount of the maximum power and of the coal cost each year, monthly payments are to be made by the Company of £275 in respect of the kilowatt charge, and 0·475d. per unit for all units supplied, the necessary adjustments of the accounts being made at the end of each complete year.

For the determination of the power he assumes that an integrating wattmeter will be employed, so arranged with auxiliary mechanism that it will automatically record the maximum consumption of the electrical energy during periods of thirty consecutive minutes, the number of kilowatts of average power being twice the number of units so recorded.

As the Company have been taking about 1,300,000 units from the Corporation, and the maximum load for the tramways has been about 575 kw., it will be seen that the capital charge to be made by the Corporation works out on this basis to 0·504d. per unit, and the total charge therefore at 0·979d. per unit. The Company have been paying an average price of 1·4d. per unit, which the Corporation claimed should be continued, and the Company asked for a reduction to 0·56d. per unit, and it is an interesting coincidence that the result of the award worked out on the new basis should have come out almost exactly the mean of these two prices.

Reviewing Mr. Hammond's decision, it is certainly the correct method to base the payment on a more or less fixed charge, *plus* a sum per unit. As, however, the capital cost to the Corporation should depend entirely on the cost of the extra plant they must reasonably put down to meet the tramway load, from information given by the Company in advance of the load itself, and not on the actual maximum load supplied,

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published November 24th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

22,234/09. **Electric Driving of Planing Machines.** LANCASHIRE DYNAMO & MOTOR CO., LTD., and G. E. MASON. The armature of the driving motor is in series with the armature of the generator of a small motor-generator. The field of the driving motor is connected direct to the supply, while the field of the generator is connected to the supply through a tappet switch operated by the planing-machine table. This switch reverses the generator field at the end of the stroke and increases the field on the return stroke so as to increase the speed. Four figures.

25,296/09. **Water Heater.** C. KRATT (Glasgow). The water is passed through one or more tubes of insulating material filled with balls or granules of carbon or other suitable resistance material through which the current is passed. The passage of the water through the carbon both heats and filters it. A heater with a vacuum jacket to prevent loss by radiation is also described. Eight figures.

25,407/09. **Induction Telephone System for Trains.** H. VON KRAMER (Erdington, nr. Birmingham.) This patent relates to the system of train telephony described in ELECTRICAL ENGINEERING, Aug. 4th., p. 513, and Sept. 15th, p. 590, and gives some particulars as to dimensions of wires and coils required. Three figures.

25,889/09. **Manufacture of Metal Filament Lamps.** H. KUZEL (Vienna). To improve the vacuum obtained during exhaustion of lamp bulbs, the mercury vapour from the air pump is prevented from entering the bulbs by placing between the pump and the bulb a large area of metal such as gold or silver leaf, zinc or copper filings, which absorbs the vapour. In addition, the mercury in the pump is cooled to a temperature of about 1° C.

29,200/09. **Motor Controllers.** ELECTRIC CONSTRUCTION CO., LTD., and F. W. CLOSE. In order to make the contact brush yield in all directions, it is mounted on an arm through the medium of an elliptic spring, the length of which runs in the direction in which rubbing takes place. Two figures.

1,597/10. **Lamp Holders.** SIEMENS BROS. & CO., LTD., and J. S. HUDDLESTON. To prevent lamps of too high candle-power being inserted in lamp holders, the contact pins of the holder have extensions of insulating material which enter recesses in the lamp cap. If the recesses are not of a certain depth, the contact pin proper will not come in contact with the lamp contacts. Four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: FINETTI and TISCHER [Light-projecting apparatus] 27,742/09; KÖLLER [Automatic safety-catches for arc lamps] 9,888/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: MALCOLM and APPLEYARD [A.-C. conductors] 9,647/10.

Dynamos, Motors, and Transformers: ELLISTON and MARRYAT [Electric driving] 25,586/09; PARSONS and LAW [Alternators] 25,785/09; FERGUSON [Train-lighting system] 26,289/09; HEYS [Commutator bars] 26,943/09; KEITCHUM [Machines] 13,330/10.

Electric Ignition: PODSZUS [Sparking plug] 7,617/10; BARTLETT [Automatic ignition and control of gas] 11,479/10; R. BOSCH [Sparking plugs] 15,901/10; WRIGHT (*Veifa-Werke Vereinigte Elektrotechnische Institute Frankfurt Aschaffenburg*) [Induction coil interrupter] 20,872/10.

Electrometallurgy and Electrochemistry: JENSEN (*Spitz*) [Recovery of tin from waste metal] 25,915/09; JOHNSON (*Badische Anilin & Soda Fabrik*) [Manufacture of nitrates] 30,502/09; THOMSON [Electric furnaces] 11,716/10.

Incandescent Lamps: HAILWOOD [Miners' safety lamp] 26,524/09; STOPFORD [Miners' safety lamps] 29,707/09.

Instruments and Meters: MCNAB [Revolution counter] 25,899/09; COWBURN [Depth indicator for tanks] 25,902/09; REITH and FLADE [Coin selectors for prepayment apparatus] 28,562/09.

Switchgear, Fuses, and Fittings: LIDDLE [Liquid controllers and starters] 21,595/09; WILSON [Switches] 23,224/09; FERNIE [Operating switches on three-wire systems] 25,668/09; HARRISON [Conduit fastenings] 25,994/09; NOBLE [Support for cables or conductors] 26,099/09; COX [Switches] 26,422/09; BRITISH THOMSON-HOUSTON CO. and YOUNG [Automatic regulators] 27,827/09; RAILING and GARRARD [Switches] 5,085/10; RAWLINS [Earthing device for switches] 8,858/10; BEARD and TOWNSEND [Lamp shades] 9,547/10; ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Switches] 9,890/10, and [Electromagnetically operated switch] 18,443/10; RYAN and HENGERER [Lamp socket] 13,165/10; SIEMENS SCHUCKERTWERKE GES. [Fuses] 17,047/10.

Telephony and Telegraphy: QUINN [Telephone memorandum] 25,757/09; CHISHOLM-ELLAMS [Telephone call recorder] 3,756/10; SIEMENS BROS. & CO. (*Siemens & Halske A.G.*) [Automatic telephone exchanges] 7,093/10, and 9,634/10; GOLDSTEIN [Central battery signalling systems] 16,331/10.

Traction: KRUMSCHMIDT [Compensating wear of brake-shoes] 29,602/09; HENRARD and LÉVÊQUE [Controlling tramway and railway points] 2,810/10; FRAZER & CHALMERS, LTD., WHITMORE, CHAPMAN and KÜBLER [Control of compressed air systems] 9,958/10; SIEMENS BROS. & CO. and FERREIRA [Electrically detecting railway points] 19,970/10.

Miscellaneous: BOULT (*Electric Meat Curing Co.*) [Electromagnetic apparatus] 23,040/09; MARKS (*Soc. Anon. Italiana Gio. Ansaldo Armstrong & Co.*) [Electrical ship's steering gear] 25,365/09; FAIRWEATHER (*Huff Electrostatic Separator Co.*) [Separators] 25,768/09; ROHDE [Feeding and reversing gear for electric rock drills] 26,051/09; JUNGHANS [Illuminating clock dials] 18,784/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: A.-G. BROWN, BOVERI, ET CIE. [Excitation of induction machines] 25,397/10.

Electric Ignition: R. BOSCH, 20,968/10; MACQUAIRE [Sparking plugs] 23,577/10.

Electrochemistry: CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE GES. [Manufacture of persulphuric acid] 23,548/10.

Incandescent Lamps: KNIGHT [Manufacture of lamps] 24,810/10.

Telegraphy: CARPENTIER [Printing telegraphs] 20,111/10.

Traction: MASLIN AND DE CHAVANNES [Signalling] 25,578/10.

Miscellaneous: FELTEN & GUILLEAUME LAHMEYERWERKE A.-G. [Cable tensioning and slipping devices] 21,335/10; ARIETS, WRIGHT AND CALDWELL [Tubing and joints] 22,310/10; HOUSEKEEPER [Contact devices for moving conductors] 24,911/10; ALCOCK & CO. PROPRIETARY [Electric process for drying timber] 25,175/10; ALLGEMEINE ELEKTRICITÄTS-GES. [Emergency braking] 25,589/10.

Opposition to Grant of Patents

20,639/09. **Heating and Cooking Apparatus.** A. F. BERRY. Opposition has been entered to the grant of this patent. The specification (abstracted in ELECTRICAL ENGINEERING, Oct. 6th, 1910, p. 636) relates to the continuous heating up of a large mass of metal from which the heat is extracted by conduction when required.

22,997/09. **Heating Apparatus.** H. A. KENT. This patent is opposed. The specification describes heating elements consisting of granular tungsten enclosed in silica glass tubes, and was abstracted in ELECTRICAL ENGINEERING, Oct. 6th, 1910, p. 636.

Amendment

5,081/09. **Current Rectifier.** T. J. MURPHY. A disclaiming note has been added to this specification, which relates to a vibratory rectifier for producing a pulsating D.-C. current from an A.-C. supply.

Surrender of Patent

18,328/09. **Flame Arc Lamp.** SIEMENS-SCHUCKERTWERKE GES. have offered to surrender this patent. It covers a flame arc lamp with three converging carbons, in which the two carbons of like polarity supporting each other contain the chemical salts for producing the flame, while the third electrode is of practically pure carbon. Persons interested should communicate with the Comptroller General at the Patent Office.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: G. C. MARKS (*General Electric Co., U.S.A.*) [Mercury vapour lamps with starting and colouring arrangements] 14,121/00; A. BLONDEL [Lamp mechanism] 16,357/03.

Dynamos, &c.: J. S. PECK and C. LE G. FORTESCUE [Transformers] 16,179/04.

Electrometallurgy, &c.: M. OTTO [Purification of liquids by ozone] 17,257/98; S. O. COWPER-COLES [Electrolytic manufacture of metal tubes and sheet] 16,210/99.

Switchgear, &c.: A. MORRISON and J. W. BUTTERWORTH [Lamp-shade holders] 17,633/02.

Traction: H. TRAUN [Trolley-line insulator] 14,164/00; ESEMANN [Tramcar life-guard] 28,922/04.

Miscellaneous: EDISON ORE MILLING SYNDICATE (*T. A. Edison U.S.A.*) [Magnetic separators] 14,355/00.

Digitized by Google

we cannot but think that, in future cases, an equitable way of arriving at the price will be to fix a definite total *sum*—not a price per kw.—as the capital charge, representing the annual sum payable for interest, depreciation and redemption on the whole of the cost of this extra plant. Similarly, we think that the charge per unit to be added to this for the works costs, &c., should be based on an estimate of the total costs of generating the traction units and not of the whole of the units supplied from the station, making this up in two items, one representing the fuel costs, which should be made to vary with the price of coal, as Mr. Hammond has decided. We trust that the final decision of the joint Committee of the Incorporated Municipal Electrical Association and the Municipal Tramways Association will advocate this method of computation.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

GENERATORS AND MOTORS.—We have received from the General Electric Co. four new lists relating to electrical plant manufactured at their Witton works near Birmingham. These deal respectively with continuous- and alternating-current generators and motors, and are attractively printed in two colours with covers each on a distinctive colour scheme. The continuous-current dynamo list contains full specifications with illustrations of detail, and lists high- and low-speed machines separately in sizes from 0·5 to 300 kw. Independent lists are also given of machines suitable for low-voltage Osram lamp installations. Balancers and boosters are also dealt with, and full details of weights and dimensions are given. The continuous-current motor list is equally well arranged, and includes constant- and variable-speed machines, as well as crane rated motors of the semi-enclosed, enclosed ventilated, totally enclosed and dustproof, water and gas tight, and pipe ventilated patterns. Useful tables of the power taken by different classes of machinery are included. In the alternating-current generator list a wealth of technical detail is given, and machines for single-, two-, and three-phase working are included for engine and steam turbine drive up to 1,000 kw. The alternating current motor list deals with single and polyphase induction motors up to 100 h.p., and some illustrations of larger machines are also given. The technical information is fuller than is usual in this class of list, and the completeness of the range of spare parts, accessories, and extras, together with the fact that dimensions and weights are given throughout in meters as well as English units greatly enhances their utility.

CABLES AND WIRES.—Messrs. Siemens Brothers and Co., Ltd. (Caxton House, Westminster, S.W.), have now issued their complete new catalogue of vulcanised india-rubber wires and cables, which supersedes the provisional catalogue of the same title, published at the commencement of October. The catalogue contains, besides the usual association and non-association wires and cables, a special section dealing with bell wires and flexibles, &c. Amongst the latter, special attention should be drawn to the new "Besto" fire resisting flexible twin wires, which have been put on the market to meet the demand for special twin flexibles for shop-window lighting. These wires have a layer of asbestos spun over the ordinary rubber insulation, under the outer cotton or silk braiding, by a special patented process. The catalogue contains, in addition, some practical tables for the use of those engaged in wiring work, and illustrations of the Woolwich works, where all the wires and cables are made.

CHRISTMAS TREE LIGHTING.—A leaflet from the General Electric Co. gives particulars of miniature Robertson lamps for running in series for Christmas tree and other temporary decorative work. The company request us to state that in order to assist contractors they are prepared to print and supply these leaflets with their name and address upon learning what quantity they can distribute with advantage.

OSRAM LAMPS.—A further addition to the series of Osram lamp posters issued by the General Electric Co., Ltd. (67 Queen Victoria Street) is a reproduction of the well-known large poster in double-crown size. The company are willing to supply copies to the trade free of cost.

ALUMINIUM.—A leaflet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), calls attention to the use of aluminium granules in iron and steel works and foundries as a deoxidising agent and for keeping large melts of metal fluid, by means of the heat generated by the reaction caused by the addition of aluminium to the melt. If small portions of aluminium are added to molten iron or steel, it combines with the oxygen and other gases absorbed by the metal in the furnaces, and rises to the top in the form of slag, which can be skimmed off. It is the presence of these gases in the metal which causes blow holes and imperfect castings, and the addition of aluminium therefore reduces the number of "wasters" to a minimum.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

PRIMARY BATTERIES.—A new and very complete catalogue of the primary cells manufactured by the General Electric Co., Ltd., at their works at Witton, Birmingham, is now ready. All the usual forms of wet Leclanché cell are included, and also the company's special "carporous" cell with the zinc in the centre, and the "carsak" type of very low internal resistance. The latest forms of G.E.C. dry Leclanché cells are also dealt with as well as the "extra sec" cell, suitable for export, which is quite inactive until water is added. Other batteries are the Edison-Lalande alkaline cells and various forms of Daniell cells. The lists of spare parts, &c., are particularly complete, and very full electrical and other data are given as to each form of cell listed. Attention should be drawn to the fact that each G.E.C. dry cell bears a label guaranteeing to replace it should exhaustion take place in stock within six months from the date stamped thereon, provided, of course, that the label is unbroken at time of return.

METAL FILAMENT LAMPS.—Messrs. Siemens Brothers' Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), have issued a new list of "one-watt" lamps, including the new 200-c.p. size mentioned in another column. Quantities of this list can be obtained overprinted with contractors' names and addresses.

SUPPLY ADVERTISING.—The Electric Supply Publicity Committee are making a further issue of supply advertising literature, consisting of a leaflet on the use of electric radiators, as suitable for being enclosed with correspondence; an electric radiator leaflet; a radiator post-card, and a series of adhesive labels, illustrating electric heating, electric ironing, and electric power, in colours, suitable for attaching to letters, accounts, &c., other publications, including a cooking leaflet, showing illustrations of up-to-date cooking apparatus and detailing advantages, a leaflet entitled "Electric Light and Health," and a coloured calendar.

LOCAL NOTES

Beckenham: *Council and L.G.B. Inspector.*—At the last meeting of the Council the Electricity Committee reported their dissatisfaction with the manner in which Mr. H. R. Hooper recently conducted an inquiry into a loan for electrical extensions (Electrical Engineering, November 10th, p. 719) and recommended that a letter of complaint be addressed to the Local Government Board. Mr. A. H. Dykes protested against any such letter being sent, but his motion was not seconded.

Blackpool: *Public Time Service.*—It is stated that a scheme for the installation of 100 public clocks to be electrically controlled by a master clock at the Town Hall is under consideration.

Cleethorpes: *Electric Lighting.*—A conference is to take place between the Council and the Grimsby Tramways Co. to discuss terms for the supply of electricity in bulk.

Cornwall: *Overhead Wires.*—The Cornwall Electric Power Co. have applied to the Board of Trade for sanction to erect a number of overhead wires.

Darlington: *Electricity Undertaking.*—At the last meeting of the Town Council some criticisms were passed upon the management of the Electricity Department, and in order to meet this a statement has been prepared showing the full financial results of the undertaking. The works have been in existence for nine years, and the total capital expenditure is £80,000. The profits, after providing for interest and depreciation, have amounted to £11,323, of which £4,882 has been devoted to relief of rates; £5,261 to reserve; and £1,180 expended on capital account. Nearly £20,000 capital has been repaid. It is claimed that last year the gross profit was higher than that earned by any electric supply company in the country, and higher than the gross profit earned by 93 per cent. of the municipal undertakings of the kingdom.

Hornsey: *Power Charges.*—New power tariffs have been framed as follows: For certain approved classes of load, 1d. per unit, supplies being cut off at peak load; for domestic purposes, a rate of £3 15s. per kilowatt per annum, plus ¾d. per unit, has been fixed. If the kilowatt charge is paid in advance for a whole year, it is reduced to £3.

Haddington: *Electric Lighting.*—A contract has been entered into with Messrs. Crompton and Co., for an electric lighting scheme.

Digitized by Google

Leeds: *Electric Lighting Accounts.*—The accounts of the electricity undertaking for last year show a deficit of £8,980 after paying £30,882 in capital charges.

Leicester: *Supply Outside Borough.*—The Lighting Committee propose to apply to the Board of Trade for an order authorising the supply of electricity in certain districts adjacent to the Borough.

London: *County Council: Coronation Illumination.*—The Fire Brigade Committee of the L.C.C. have drawn up a suggested list of precautions in order to prevent accidents from electrical illuminations during the Coronation of His Majesty the King next year.

Stepney: Tramways.—The Council have refused to consent to the proposal of the L.C.C. to adopt the overhead system along Burdett and Grove Roads, and insist upon the conduit system.

Loughborough: *Street Electric Lighting.*—The Tramways Committee have recommended the conversion to electric lighting of the existing gas lamps along all the routes of electric mains. The charge is to be £2 18s. 6d. for the first three years per lamp, to include the cost of conversion, and £2 15s. per lamp per annum afterwards. When the proposal was considered by the Council an amendment referring the matter back was carried.

Morley: *Tramway Purchase.*—The Council have decided to purchase so much of the undertaking of the Tramways Company as is within their district. An application is to be made by the Light Railway Commissioners for the construction of further lines.

Potteries: *Abandonment of Tramways.*—Lieut.-Colonel Druitt, of the Board of Trade, held an inquiry at Stoke-on-Trent on Thursday into an application by the Potteries Electric Traction Co. to abandon certain light railways authorised in 1897 and 1902, at an estimated cost of £43,000. The reason for the request to abandon these lines is that the Company's investigations go to show that they will not be remunerative. Opposition to the proposal came from all the districts concerned, and the inquiry was closed.

Scarborough: *Winter Tramway Service.*—The Scarborough Electric Tramways Co. has not yet complied with the order of the Board of Trade to commence a winter service. Messrs. Edmundsons' Electricity Corporation has secured the appointment of a secretary as receiver of the Tramways Company in respect of a claim for £515, arrears of interest under a mortgage of £25,000 dated February last.

Southampton: *Motor Hiring.*—It has been decided to hire out motors at a rental of not less than 20 per cent. per annum of the cost, and radiators at 10s. per annum. For motors costing more than £100, special arrangements are to be made. The Chairman of the Committee, in putting this proposal forward, stated that with regard to wiring it was proposed to charge cost, plus 10 per cent., to be paid in 12 quarterly instalments. It was the desire of the Committee to help the contractors in the town. Therefore they did not propose to sell fittings, but there will be a schedule of prices, and it will be to the benefit of the contractors that the scheme should proceed, as the work would go through their hands. This was why the charge for radiators had been fixed at the somewhat prohibitive price of 10s. per year.

Torquay: *Tramways.*—The Mayor of Torquay made a statement regarding the surface-contact tramways at the annual dinner of the Torquay Chamber of Commerce last week. He complained that the Board of Trade should have condemned the system, whilst all the inhabitants were in favour of its retention, and said that until the end of his days he would maintain that the town had not had fair play in the matter. It seemed to him that the Council had had to fight the Tramways Company, the arbitrator, and the Board of Trade.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—The Melbourne Council require six single-phase transformers. Particulars from Messrs. McIlwraith, McEacharn & Co. Propty., Ltd., Billiter Square Buildings, London, E.C. The Council also require six tons of bare hard-drawn copper cables.

Barking.—Tenders are invited by December 20th for a 400-kw. Diesel engine set; 250-kw. motor-generator; traction battery, and reversible booster; main switchboard and mains; and overhead travelling cranes. Particulars from the Borough Electrical Engineer.

Ealing.—An expenditure of £20,000 is recommended for mains, extensions, and meters.

Edinburgh.—A loan of £37,000 is to be applied for in connection with the scheme of cooling towers at Dewar Place, and the replacement of certain plant to be scrapped.

Finchley.—A loan of £10,000 has been applied for, for prospective expenditure on mains, services, and meters.

Heckmondwike.—A Local Government Board inquiry was held last week concerning a loan of £24,159 for electrical extensions. According to a remark made by Mr. H. R. Hooper, £20,000 have been expended on the electricity undertaking without sanction, and he commented somewhat severely upon this method of carrying on the undertaking.

Leicester.—The Tramways Committee recommend the borrowing of £12,000 for cables and works in connection with the supply of electrical energy for power purposes in the tramway station.

Leyton.—The Council require a 600 kw. mixed pressure turbo-generator. Particulars from the Borough Electrical Engineer, and tenders by December 29th.

Llandudno.—A loan of £2,322 is to be taken up for electrical extensions. Mr. H. R. Hopper, the Local Government Board Inspector, who conducted the inquiry, suggested that services should be paid for out of revenue.

London: *London County Council.*—The Council require 5,000 tons of steel girder rails and fastenings, and about 700 tons of conductor tees. Particulars from the Chief Engineer, and tenders by December 6th.

Islington.—The Electricity Committee require a high tension switchboard. Particulars from the Electrical Engineer, and tenders by January 12th.

Southwark.—A loan of £6,909 has been granted for electric lighting purposes.

Newport (Mon.).—A loan of £31,000 has been sanctioned by the Local Government Board.

New Zealand.—The Taihape Council require a generating plant in connection with a water-power scheme. Tenders to the Town Clerk by January 11th. The *Board of Trade Journal* says that specifications can be seen at 73 Basinghall Street, London, E.C.

South Africa.—A loan of £2,450 is to be taken up by the Standerton Council for electric lighting purpose.

Wilts.—A generator, motors and wiring are required for a private installation in Wilts. (See an advertisement on another page.)

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Proposed new baths at Ealing.

Alterations to schools in Old Kent Road and Drury Lane for physically defective children.

New school for physically defective children in Lewisham.

PROVINCES.

Bath.—Receiving Home for Children. The Guardians.

Birmingham.—Enlargement of Smethwick Branch Post Office. Smethwick Postmaster or H.M. Office of Works.

Bishop Auckland.—Extensions to Workhouse.

Bristol.—Cinematograph hall in Clare Street.

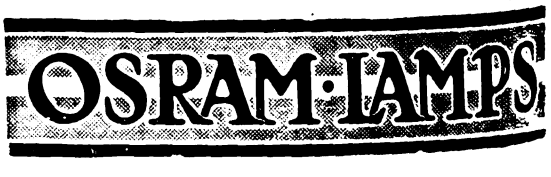
Derby.—Improvements at Brighton Road School.

Dundee.—New Mechanical Engineering Laboratory at University College.

Durham.—New school at Trimdon, and alterations to Cross School.

Edinburgh.—Electric theatre at rear of Miln's Hotel, Lauriston Street.

Church in memory of the late Professor Charteris. Architect, Mr. J. B. Dunn.



Farnworth.—New Council school.

Faversham.—Rebuilding of Lord Sondes' residence, recently destroyed by fire.

Glasgow.—Block of buildings in Jail Square.

Keighley.—Extensions to Workhouse.

Kidderminster.—New secondary school. Builder, J. Brickwater, Cradley Heath.

Digitized by Google

Leicester.—Public Hall and Concert Pavilion. Town Clerk.
Maidstone.—Drill hall in Union Street.
Morley.—Extensions to Parkfield Mills. Architect, T. A. Buttery, Queen Street, Morley.
Norfolk.—Cottage hospital at Wells. Architect, Mr. Leslie T. Moore.
Oxford.—Swimming baths in High Street. Extension to Sanatorium.
Salford.—A secondary school for boys in Leaf Square.
Walton-on-Naze.—New elementary schools.
Warrington.—New schools.

MISCELLANEOUS

Australia.—Tender forms for the supply of insulators, wires, &c., have now been received at the offices of the Commonwealth for Australia, 72 Victoria Street, London.
Birmingham.—The Tramways Committee require 400 tramway poles. Particulars from the General Manager, and tenders by December 12th.

TENDERS RECEIVED AND ACCEPTED

Hull.—The tender of Messrs. C. Greenwood, of Hull, has been accepted at £3,676, for the building of the extension to the car shed at Anlaby Road.
London: *County Council.*—Tenders have been received from the following firms for the electric lighting of the fire station in Parnell Road, Bow:—Tilley Brothers (recommended), £167; Johnson & Phillips, Ltd., £190; Malcolm & Allen, Ltd., £198; W. J. Fryer & Co., £233 13s.
The Stores and Contracts Committee have accepted a tender of Messrs. John Pickles & Sons to supply and fix an electrically-driven cross-cut bench saw at the Clerkenwell Furniture Stores at a cost of £53 10s.
Marylebone.—The Electricity Committee recommend the acceptance of a tender by the Tudor Accumulator Co. for a new battery at Manchester Square station at £2,795 10s., with maintenance contract for 20 years at £220 per annum.

Workmen's Compensation.—A brass worker named Arthur Mason, in the employ of the Electrical Power Storage Co. was awarded 13s. 9d. a week compensation at Birmingham last week through injuries received from sulphuric acid. It was stated that one finger on the left hand has been amputated, and that another operation is necessary.
At Woolwich County Court last week a machine attendant named Vincent Barber in the employ of the Western Electric Co., Ltd., was awarded £7 16s. 8d. damages for the loss of two finger-tips whilst attending a press punch which it was alleged had not been properly fenced. The company was summoned by the Home Office Factory Inspector a short time ago in respect of the fencing.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—*Members:* W. B. Boyd, D. Murray, R. P. Sloan. *Associate Members:* C. W. Appleby, G. Archer, A. T. Arnall, H. E. Blake, W. H. Bradbury, J. Brownell, P. H. Buzza, W. A. Christianson, C. H. Cox, G. P. Dennis, L. C. Desbruslais, N. Donkersley, R. N. Eaton, T Ellis, A. L. Johnson, D. Kerridge, A. Kirk, H. R. McClymont, W. E. Morby, W. Napier, G. Paton, T. E. Robertson, M. Rosenbaum, J. H. Ryder, J. V. Stanton, W. J. Wayte. *Students:* H. Algar, A. Arnold, H. A. Browett, B. A. Churcher, B. Jain, D. N. Jenkins, E. A. Martin, H. N. Munro, J. S. Navarra, H. Papazian, W. Parry, L. C. Pocock, J. T. Radcliffe, J. F. Riley, B. A. Robinson, J. P. Rowell, H. E. Sanders, B. K. Sibou, H. W. Trefusis, D. H. Umrigar, H. K. Whitehorn, W. E. Woodward, E. Wyatt.

Recent Installation Work.—Messrs. Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster), inform us that they and Messrs. Siemens Brothers & Co., Ltd., have recently obtained a large number of orders which they have sublet to local contractors, as they themselves do not do actual wiring work. For example, Messrs. J. H. Harpin, electrical contractors, of Birmingham, are now carrying out an installation of 450 lights at the Hawkesyard Priory, Rugeley, with "Stannos" wires, using the sheathing as the return conductor, and "Zed" fuses are used throughout. The power is supplied by a Siemens generator driven from an Austin petrol engine. The switchboard is being made by Siemens Brothers Dynamo Works, Limited. A 60-cell battery by Pritchetts & Gold is being installed. The generating plant is provided with Walker, Horrocks & Co.'s system of automatic control, whereby the generating set starts itself as soon as the battery voltage falls below a certain value. Siemens cables are used throughout. Messrs. S. Gillett are carrying out the wiring with "Stannos" at the Church at Whitley Bay, Northumberland, and that firm is also carrying out for Siemens Brothers the complete electric installation, including 10 h.p. generating plant with battery and switchboard of a private house at Haydon Bridge, Northumberland.

APPOINTMENTS AND PERSONAL NOTES

Mr. H. N. Sporborg, chief engineer, and Mr. W. C. Lusk, manager of Export Department of the British Thomson-Houston Co., Ltd., have been appointed members of the Board of Directors.

Mr. W. H. Sayers informs us that his office at 39 Victoria Street, where he has been continuing the consulting practice carried on by Mr. H. M. Sayers before his departure abroad, is now closed. Telephone messages may, however, be sent to the office of Messrs. Sayers & Wesson, 19 Hanover Square (Gerrard 4787), and letters may be addressed to 11 Knollys Road, Streatham, S.W.

Salesman wanted for wholesale electrical fittings showrooms in Manchester district. (See an advertisement on another page.)

Supply Company has vacancy for Improver. (See an advertisement on another page.)

Messrs. H. A. Neale and G. J. Freund, who have for some years been in prominent positions in the Contract Department of Messrs. Crompton & Co., have severed their connection with the company and started business under the name of Neale & Freund, Ltd. (31 Budge Row, Cannon Street, E.C.). They will undertake the electrical equipment of factories, workshops, country houses, &c., and the export of machinery and plant to foreign markets.

Mr. C. Lakin-Smith, the retiring local Engineer and Manager of the Guernsey Electric Light & Power Co., has been presented with an oak smoking cabinet. Mr. A. N. Rye succeeds Mr. Lakin-Smith.

The salary of Mr. F. H. Edwards, Deputy Electrical Engineer, Erith, has been increased from £180 to £200 per annum.

Mr. W. A. Valon has been appointed Engineer and Manager of the Stafford Electricity & Gas Works. Mr. Valon has been Chief Assistant Engineer at the South Shields Gas Works, and it is stated that although he will have the general management of the two undertakings, the direct management of the electricity works will be in the hands of the Resident Engineer, Mr. Mead.

The Union Cable Co. require a Works Manager for their new factory. (See an advertisement on another page.)

Mr. T. A. Nunwick, for many years chief representative for Messrs. Dorman & Smith, has resigned that position to take up a similar appointment on the staff of Messrs. Parmiter, Hope & Sugden, Hulme Electrical Works, Manchester. This necessitates his relinquishing the various agencies which he has held during the past two or three years; but as Messrs. Parmiter, Hope & Sugden are the selling agents in Lancashire, Yorkshire, Cheshire, and North Wales, for the Gilbert Arc Lamp Co. and Metalite, Ltd., he will represent these firms also.

Railway Rates for Electrical Goods.—At Aston last week the General Electric Co., Ltd., of Witton, were summoned for consigning two parts of a stator, which they despatched by the Midland Railway, as two cases of "bearers." The charge was that the employees of the company in so consigning the goods had in view the object of securing a lower rate, namely, 9s. 2d. per ton instead of 22s. 9d. per ton, had the goods been sent as stator parts. The company contended that it was right to describe the goods as bearers, and that they had been despatched under that description previously. The Bench found that the description of the goods was false, and imposed a fine of £20 and costs, with £10 special costs.

Northern Telephone Exchange, Birmingham.—On Saturday last, at 2 p.m., the National Telephone Company transferred the subscribers connected to its Northern Exchange to a new central battery equipment installed in a building suitably altered to accommodate a telephone equipment at Villa Road, Handsworth. The new equipment has been manufactured and installed by the Western Electric Co., Ltd., of North Woolwich, and is of the No. 1 C.B. type, consisting of six subscribers' positions, giving accommodation for 690 lines, and two incoming junction positions. The equipment is of similar design to those previously described in ELECTRICAL ENGINEERING.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Co., of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 10s. per ton (last week, £59 15s. to £60).

Liquidations.—A meeting of the Polesworth Electric Appliance Co., Ltd., will be held at the offices of Messrs. H. Hackett and Co., 36, Cannon Street, Birmingham, on December 20th, to hear the liquidator's account of the winding up.

Bankruptcies.—The discharge of Frank Shepherd, Electrician, of 4 Haslett Road, Kensington, London, has been suspended for two years from October 18th last.

The trustee in the bankruptcy of J. Platt and R. Bleasdale, trading as Platt & Bleasdale, electrical engineers, Victoria Square, Bolton, has been released.

The discharge of Arnold Roberts, electrical engineer, 21 North Parade, Bradford, has been suspended for two years as from October 18th, 1912.

Plant for Sale.—The Wolverhampton Electricity Department have a 500 kw. generating set for sale. (See an advertisement on another page.)

Exhibition Award.—A gold medal has been awarded to the United States Metallic Packing Co., Ltd., for their exhibit at the Buenos Aires Exhibition.

British Agency.—The firm of G. Schniewindt, of Neuenrade (Germany), have appointed Mr. H. W. Cressall (13 Sumner Row, Birmingham) sole agent for their resistance nets and other manufactures in this country, to whom all inquiries should be addressed.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Douglas Southern Tramways.—The net profit for the past year was £1,636, and after meeting 5 per cent. preference dividend a balance of £338 is carried forward.

Oxford & District Tramways Co.—The report for the past year states that the directors are not able to say when the conversion of the lines to electric traction will take place, owing to the condition of the money market and other circumstances. It will be remembered that the final arrangement was to have the conduit system in the centre of the town, and the overhead system elsewhere, and this combination is put forward as an obstacle in the way of securing the necessary finance within a reasonable period.

Isle of Thanet Electric Tramways & Lighting Co.—There was a profit of £18,242 for the year to September 30th, compared with £15,053 in the previous year. After paying 2½ per cent. on the preference shares it is proposed to place £2,500 to reserve, £2,500 to maintenance and permanent way, and to carry forward £2,277.

Aron Electricity Meter.—Transfer books will be closed from December 7th to 14th inclusive.

Adelaide Electric Supply Co.—The report for the year to August 31st shows a credit balance of £42,239, and a dividend of 7 per cent. is paid on the ordinary shares after meeting the 6 per cent. preference share dividend. A bonus of 2s. per share is also paid upon the ordinary shares. Dividend equalisation fund is credited with £15,000, and depreciation account with £1,000, the carry forward being £4,551.

Electrical Bills in Parliament.—We give below further particulars of those private Bills of electrical interest which are to be promoted in the next session of Parliament, in addition to those given in our last issue :—

Electric Lighting Orders will be applied for in respect of Wycombe (extension), Ashford, Portishead and district, Sevenoaks, Budleigh Salterton, Truro, Coombe, Aldeburgh, Goole, Bognor, Gloucester Corporation (exemption of generating stations from nuisance).

Tramway Bills are being promoted by the Newcastle-upon-Tyne Corporation (use of trolley omnibuses, &c.), Chiswick Urban District Council (lines to be transferred to London United Tramways Co), Caterham and district (trolley omnibuses), Belfast, Aberdare (trolley omnibuses), Halifax, London County Council, Manchester, Middlesborough, Stockton, Thornaby, Northampton, Paignton, Southampton, South Lancashire Tramways, Mansfield (trolley omnibuses and electric lighting), and Brighton, Worthing.

It is proposed to incorporate the Greater London Railway Co. for constructing railways in the Counties of Middlesex and Essex to make junctions with all the main-line railways serving London. Liverpool Overhead Railway Bill will deal with the capital of the company.

OFFICIAL ANNOUNCEMENTS AND SMALL ADVERTISEMENTS.

Official Advertisements are charged at the rate of 9d. per line (column width). Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of 1/- for the first 12 words and 1d. per word afterwards. Three insertions for the price of two. Advertisements can be received up till Wednesday morning first post.

Letters should be addressed to THE KILOWATT PUBLISHING CO., LTD., 203–6, Temple Chambers, London, E.C.

MISCELLANEOUS NOTICES.

NOTICE is hereby given that the transfer books and register of members of ARON ELECTRICITY METER, LTD., will be closed from Wednesday, December 7th, to Wednesday, December 14th, 1910, both days inclusive.

By Order,
M. ARON, F.C.I.S., *Secretary.*

AGENCIES for RUSSIA and FINLAND.—A first-class firm in St. Petersburg devotes itself to selling in Russia and Finland all kinds of technical inventions, &c. Address for offers : COMMERCIAL HOUSE ROBERT FLECKENSTEIN, Tshernisheff Str. 16, St. Petersburg. Best references from banks. Correspondence in all European languages.

TENDERS required for Generator, Motors, and Wiring. Plan and Specifications may be seen at B. SAWTELL & SONS, Ltd., Melksham, Wilts.

500 KW. 500 volt D.C. Generating Set, speed 270 r.p.m., low price for prompt sale.—ENGINEER, Electricity Works, Wolverhampton.

GAS RETORT CARBON for Sale. Pitch, Insulating Material, Creosote. We supply the Trade.—V. DASNIERES, 10 St. Mary Axe, London, E.C.

C. JENNINGS & CO. can supply woodwork of any description at short notice. Stairs, Balusters, Newels, Handrails, Sash bars, Mouldings, Joinery. Support British Industry, and refuse Foreign doors. We compete. Electric casings and underground troughing also supplied. JENNINGS & CO., 955, PENNYWELL ROAD, BRISTOL.

APPOINTMENTS VACANT.

THE UNION CABLE COMPANY, LIMITED, require the services of a

CABLE ENGINEER AND WORKS MANAGER for their new factory near London. Applicants must be Electrical Engineers and have up-to-date knowledge and experience of the manufacture of all classes of Cable (submarine excepted) and all work pertaining thereto, and be competent to superintend the disposition and erection of the Factory machinery.

Applications (which will be treated with the strictest confidence) to be addressed to the Chairman of Directors.

BERNHARD HIRSCHMANN, Esq.,
Deutsche Kabelwerke A.-G.,
Rummelsburg,
Berlin

SMART SALESMAN wanted, with good address, for large wholesale showrooms, Electrical Fittings, in Manchester District. Previous experience and highest references required. Apply, Box 318, ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C.

SUPPLY COMPANY has vacancy for IMPROVER. Applicants must have mechanical training, and be over 21 years of age. Good opportunity to get experience in high tension 3-phase generation and distribution. Wages, 10s. per week to commence, rising to 25s. Apply, Box 319, ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C.

APPLICATIONS for Appointments effectively arranged, ensuring favourable consideration. Numerous unsolicited testimonials. Expert advice. Write now.—HERBERT GREATOREX, Beechwood, Matlock.

SUMMARY

Public demonstrations of street lighting are to be made in Gower Street, London, by the Gas Light & Coke Co. and the Metropolitan Electric Supply Co. respectively. The specification prepared by the Holborn Borough Surveyor is open to the objection that the lamps may have a most unsuitable light distribution curve and yet satisfy the conditions. (Page 772.)

A 160 kw. Diesel engine set has been added at the Felixstowe electricity works. The reception tests gave results corresponding to fuel costs of 0·18d. per unit at full load, and 0·22d. at one-third load. (Page 773.)

Mr. W. Tatlow's inaugural address to the Dublin Section of the Institution of Electrical Engineers dealt with the subject of measuring and testing apparatus. (Page 774.)

We publish a detailed description of the electrical installation at Messrs. Arding & Hobbs' new premises, which have been rebuilt since the fire of last year, and represent the largest London drapery establishment south of the Thames. The ground floor is lighted by 60 enclosed arcs, and 900 metal-filament lamps are employed in other parts of the building. Flame lamps hung outside are relied upon entirely for the window lighting. (Page 775.)

In our monthly article on new electrical supplies and accessories we describe some new designs of shades, an improved pattern of electric iron, a cheap form of radiator, a new ampere-hour meter, a portable electrically-driven vacuum cleaner, and a convenient tool for removing shade rings from lampholders. (Page 777.)

A brief illustrated description of Messrs. F. & C. Osler's showrooms appears on page 779.

Among the specifications published by the Patent Office on Thursday last was one by J. J. Rawlings for an earthing device for tumbler switches and other wiring fittings. H. A. Beard and T. W. Townsend describe a shade holder comprising a resilient sleeve fitting over the lamp cap and resting on the pins. In spite of opposition, a patent has been granted to G. Schauli for a dry-cell paste consisting of flaked rice, and zinc and ammonium chlorides. The patent by L. D. Cibie for arc lamp mechanism of the supported carbon pattern is opposed. A patent relating to inter-communication telephones expires during the current week after the full life of fourteen years. (Page 780.)

"The Wiring Contractors' Point of View" deals with the suggestions which have been issued by the London Fire Brigade on the subject of the Coronation illuminations, and also reviews the present position with regard to the proposed Municipal Wiring Bill, which, it is expected, will not be introduced this session. (Page 781.)

The action against Sir John Benn for libel in respect of the experiment with the G.B. surface-contact system in the Mile End Road, ended on Thursday with a verdict in favour of Messrs. Griffiths & Bedell. Damages were assessed at £12,000, but a stay of execution was granted with a view to an appeal. (Page 782.)

Sir Francis Oppenheimer's annual Consular Report upon the trade of Frankfort contains some interesting notes on the German electrical industry. Conflicting statements have been made as to the revenue from the new lamp tax. (Page 782.)

In view of the probable compulsory electrification of the main line sections within the metropolitan district of Boston, Massachusetts, the railway companies concerned have submitted reports and estimates to a specially appointed Commission. The New York, New Haven & Hartford Railroad proposes the single-phase system for its lines, and estimates the cost for these and the Boston & Maine Railroad lines at £6,550,000. The Boston & Albany Railroad chooses the direct-current system with third-rail and 1,200 volts pressure, and estimates the cost of its equipment at £1,282,000. Objections are made to the proposals, and the necessity of higher rates if the work is done is pointed out. (Page 783.)

Digitized by Google

A DESCRIPTION is given of the electric driving at the works of Messrs. Thomas Smith, Ltd., of Saltley. (Page 783.)

MR. F. BROADBENT replies to a letter in our last issue regarding connection of overload devices to motor-starters, and a correspondent states that the device described has already been adopted by a well-known firm. Another letter calls the attention of our readers to the Electrical Trades Benevolent Institution. (Page 779.)

A NEW device for removing scale from boilers has been introduced. It consists of three steel discs similar to milling cutters mounted in a holder, and driven from an electric motor by means of a flexible shaft. (Page 784.)

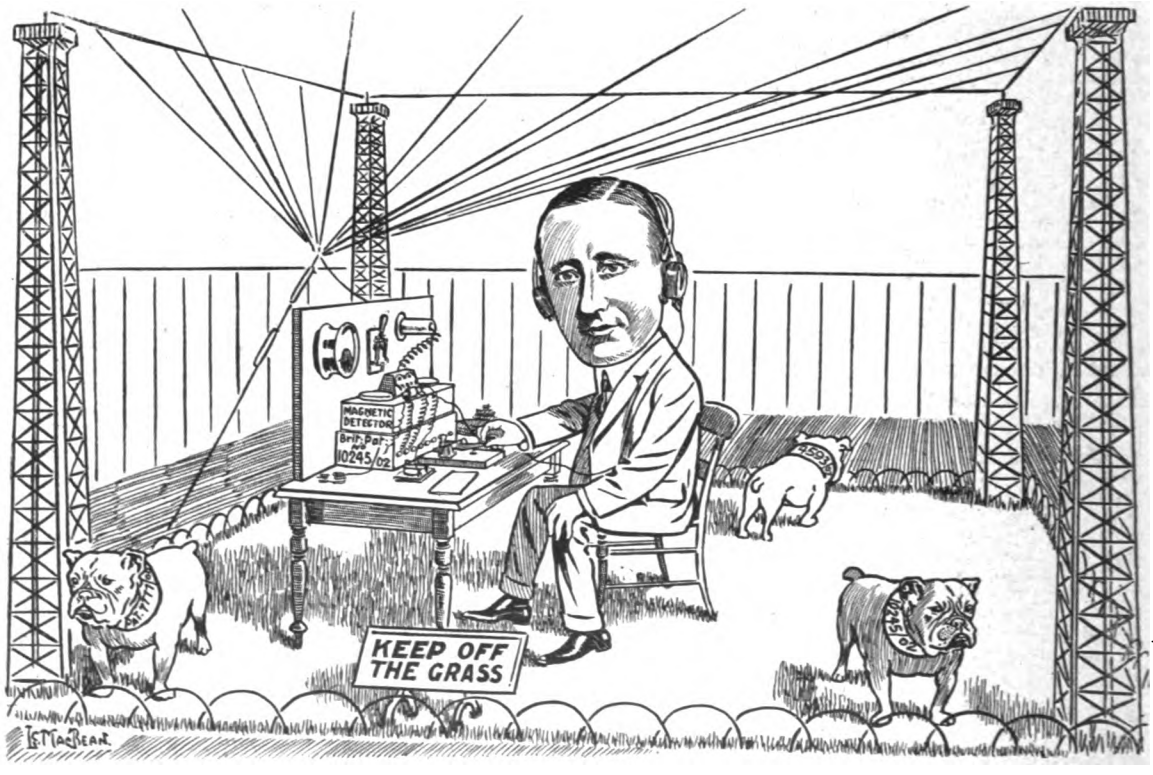
IN Sir J. J. Thomson's presidential address to the Junior Institution of Engineers, a plea was made for a closer connection between pure science and engineering. (Page 784.)

AT an inquiry regarding overhead electric lighting wires at Dawlish, Mr. Trotter, of the Board of Trade, said that he had to think of the public safety, and not of unsightliness.—The London County Council proposes to purchase its large supplies of coal direct from collieries, and to appoint a chemist in this connection.—The Islington Council are installing 16 additional arc lamps, which will replace 40 gas lamps.—A large water power scheme is about to be developed on the west coast of Mexico.—The New Zealand Government also propose to develop their sources of water power in connection with railway electrification. (Page 785.)

BOURNEMOUTH CORPORATION require tenders for 1½ miles of overhead trolley tramways; Eccles Corporation propose to expend £1,000 on motors for hiring; an additional 200 kw. of generating plant is required at Loughborough; extensions are contemplated at Carnarvon, £1,911; Stepney, £10,000; Haslingden, £5,000. Cables are required at Todmorden, and a testing set by the Australian Postmaster General's Department. (Page 785.)

EXPERIMENTAL LIGHTING IN HOLBORN

AS the result of a protest by a large body of ratepayers in the borough of Holborn against a proposal of the Council to hand over the street lighting to the Gas Light & Coke Co., without inviting tenders from the three electricity supply companies in the borough, the Council have invited the companies concerned to give a public demonstration in order that the two methods may be compared. The following notes from the specification of Mr. E. F. Spurrell, the Borough Surveyor of Holborn, kindly lent us by Mr. H. B. Renwick, of the County of London Electric Supply Co., are of interest.



The experimental lighting is to be arranged in Gower Street, which is 397 yards in length and about 47 ft. wide, and is now lit by 16 gas lamps. The northern half of the street, 198 yards long, is to be placed in the hands of the Gas Light & Coke Co., and the southern half will be dealt with by the Metropolitan Electric Supply Co. as representing the three electricity supply companies, the other two being the County of London Electric Supply Co. and the Charing Cross, West End & City Electricity Supply Co. The companies are to take over the lighting for not less than one month, supply all the fittings required, to obtain the necessary wayleaves, &c., and to be responsible for maintenance and repair during that period. Each fitting is to be provided with lamps or burners, giving a minimum of 300 candle-power as measured directly by the Council's portable photometer at ground level. Reflectors will be used to diffuse the rays, and these are to be horizontal and with either flat or convex surface.

The specification continues:—"The candle-power shall be arrived at by taking the average of two sets of readings in any position with regard to the light under test—one set at an angle of 20°, and a second set at an agle of 50°, to the horizontal. The test shall be taken in such a manner as to ensure that glazing bars shall not interfere with results. The photometer shall be the 'Trotter' photometer."

The tests are to be made in clear weather, and in the presence of representatives of the companies. It is also stated that the light shall be a steady white or yellowish-white.

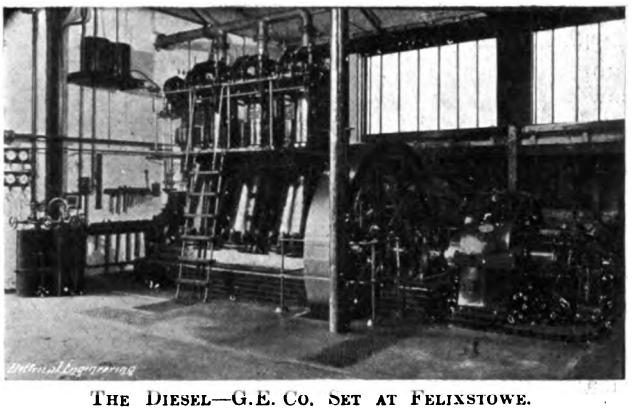
It will be noticed that the part of the specification relating to the method of determining the effectiveness of the lighting is exactly the same as that adopted in the much-discussed Westminster specification. As has already been pointed out, this is open to the objection that the candle-power of the lamp measured at either angle may be quite inadequate provided that the figure at the other angle is sufficient to bring up the average to 300 candle-power.

[*For* ARRANGEMENTS FOR THE WEEK *see page* 781.]

An important patent action will commence next week.

Digitized by Google

DIESEL ENGINE PLANT AT FELIXSTOWE



AN interesting little ceremony took place at Felixstowe on Saturday, when a new 150-kw. set at the electricity works was started up by the Chairman of the Urban District Council. Although this represented an increase of over 50 per cent. in the plant capacity of the station, the event would not be worthy of more than passing mention were it not for the fact that the local circumstances would in the ordinary course necessitate high works costs, whereas, by the employment of a Diesel engine for this extension, extremely low fuel costs may be expected. The guaranteed full load consumption is 0·702 lbs. of fuel per kw.-hour, and the result on test was 0·68 lbs.; at two-thirds load the guarantee was 0·768 lbs. and the test 0·671; and at one-third load the guarantee 1·029 and the test 0·828 lbs. per kw.-hour. The fuel employed is a crude oil, costing at Felixstowe 50s. per ton on a contract, so that the fuel costs per unit generated, calculated from the test figures, will be about 0·18d. per unit at full load and 0·22d. at one-third load. The Diesel Engine Co., Ltd. (179 Queen Victoria Street, E.C.), who supplied the engine, are to be congratulated upon these extremely good results. The high efficiency at light loads is particularly interesting and valuable in a small station. It may be added that the cooling water tests were also satisfactory, the guarantee being 4 gals. of water per b.h.p.-hour, with water entering at 60° F. and leaving at 120° F., while the test showed that only 2·85 gals. of water were required. The water is cooled by a small natural draught cooling tower placed on the roof.

The electricity works at Felixstowe occupy rather an unfortunate position; they are well in the centre of their load, but they are surrounded by houses. Although for the most part, at any rate, these houses have sprung up since the works were erected, yet it is, nevertheless, necessary that the works should run practically noiselessly and without serious vibration; moreover, the cost of coal at the works would be fairly high. It is seen, therefore, that the Diesel engine is an almost ideal one for these conditions.

Felixstowe is the largest of three stations run by the Suffolk Electricity Supply Co., the other two are at Stowmarket and Diss. The undertaking was founded by Mr. Napier Prentice, who is the chief engineer to the company. At Felixstowe, after the works had been running for some time, the Urban District Council obtained a Provisional Order, and by subsequent arrangement they acquired the electricity works from the company, who now lease them from the Council by paying the annual capital charges, and run the station. Mr. R. P. Wilson acts as Consulting Electrical Engineer to the Council, and all extensions are carried out under his and Mr. Prentice's joint supervision. The system is at present a 2-wire 200-volt system. There are about 480 consumers, and an equivalent of about 12,000 30-watt lamps. Overhead wires are employed, except in the case of two feeders, which are underground. Bare copper is used, chiefly fixed on ceiling brackets. The consumer has to lead in from the terminal insulator from the chimney. The previous plant consists of two 20-kw. and two 65-kw. sets, driven by horizontal gas engines, and an 80-kw. set driven by a vertical gas engine; the two smaller sets are run with town gas and the others with producer gas.

The new set, as already stated, has a 150-kw. Diesel engine, and it will take the whole load of the station except during the summer peak which is the characteristic of seaside towns. The engine was made to the designs and inspection of the Diesel Engine Co., by Willans & Robinson, Ltd. It drives a 6-pole General Electric Co.'s shunt-wound dynamo rated at 640 amperes, with a maximum pressure of 235 volts at 195 revs. per minute, and has a 9-ton flywheel. There is a D.P. battery with 11,000 ampere-hour capacity at the ten-hour rate, and a reversible booster. At night the engine plant can be shut down, and the cells take the comparatively small all-night load. The old switchboard was of Whipp & Bourne's manufacture, and the new panel for the Diesel-G.E.C. set is being supplied by Bertram Thomas.

The principle of the Diesel engine is probably known to the majority of our readers. It has a 4-stroke cycle. On the first downward stroke air is admitted, on the upward stroke all the valves are closed and the charge of air is highly compressed until about three degrees before the top dead centre, when the fuel valve is opened and the oil is injected against the compression pressure by still more highly compressed air from separate reservoirs. The high compression causes instant combustion without any other ignition device,

THE DIESEL—G.E. CO. SET AT FELIXSTOWE.

and this partakes more of the nature of a slow burning as the fuel is sprayed in than of a sudden explosion. When the combustion is complete, during the next downward stroke the gases expand in the ordinary manner, and in the last upward stroke they are exhausted. There are three cranks at 120°. The air pressure is produced by a Reavell compressor of the quadruplex type directly coupled to the crank shaft; it works without suction valves, the gudgeon pins uncovering the ports. Atmospheric air is compressed up to about 700 lbs. pressure, and is then led to three "bottles" for the compressed air storage. One of these only is employed for the injection of the fuel, and the other two are bye-passed so that they are charged while the engine is running, and they are also used at starting. To start the engine the three "bottles" are connected to one of the cylinders of the engine, so that it starts by atmospheric pressure alone, and after two revolutions the fuel is admitted and the compressed air cut off. One of the tests was ten successive starts, which reduced the pressure in the bottles from 60 down to only 35 atmospheres.

The fuel is stored in a tank in the yard of the station, whence it is pumped by a hand-pump to an overhead reservoir in the station, from which it drops by gravity to a feed-tank. A pump on the top of the engine feeds the fuel in the cylinder in proper quantities for the load, and it is controlled by the governor of the engine, which regulates the time of closing the suction-valve of the pump.

After the starting-up ceremony, the guests were entertained at dinner by the Directors of the Diesel Engine Co. and the Suffolk Electricity Supply Co. Mr. P. C. N. Peddar, Chairman of the latter company, presided. Mr. E. H. Woodmancy, Chairman of the Urban District Council, in responding to the toast of the Felixstowe U.D.C., said that he occupied a unique posi-

Digitized by Google

tion, as he is the Vice-Chairman of the gas company, and had had to start up the electric lighting plant. He endeavoured to keep an open mind, and had years ago advocated that the electric lighting should be in the hands of the Council. He had been one of a deputation of three who had inspected Diesel-engine plants before deciding upon the adoption of this one, and was satisfied with the noiselessness and efficiency of the Diesel engine. Had they not adopted this type it would have been necessary to move the works owing to complaints of noise and smell. Moreover, the cost of generation would be considerably reduced, and he hoped they would soon have an all-round price of 6½d. per unit, at Felixstowe [at present the price is raised to 8d. per unit during the summer season]. Mr. C. A. Baker (representing Mr. R. P. Wilson, the Consulting Engineer) wished success to the Diesel Co. He referred to the smoothness with which the contract had been carried out, and also to the satisfactory reception tests. The low-load tests had so far exceeded the guarantees that he had at first thought that the Diesel Co.'s Resident Engineer was carrying out an elongation test on his leg. Mr. W. T. Batho, replying for the Diesel Co., read out the test results, which we have given earlier in this article. He also quoted from the report of Mr. Milton, of the Maidenhead Electricity Works, in which he stated that although the output for the second quarter this year was 18,000 units in excess of that of the corresponding quarter last year, the cost of fuel had been £71 less on account of the saving by using the Diesel engine. Out of 11,311 units generated in one week, 4,798 units generated by the steam engine had cost £13 4s., while the 6,518 units generated by the Diesel had only cost £5 11s. To illustrate the efficiency at light loads, he instanced the case of Leatherhead, in which, with a 51 per cent. load factor in the winter, the fuel costs were 0·21d. per kw.-hour, while with a 13 per cent. load factor in the summer they only rose to 0·217d. At Letchworth [a 150-kw. set which is fully loaded for ten hours daily and then shut down] the costs had been 0·34d. per unit with suction gas, but were now only 0·165d. with a Diesel engine. Mr. Humphrey, the Town Clerk, proposed the toast of the General Electric Co., who had supplied the dynamo, and Mr. Anderson returned thanks on behalf of the company. He said that during the last few years his company had supplied five sets for coupling to Diesel engines, which had given every satisfaction. Mr. Batho then proposed the health of Mr. Napier Prentice, who, in replying, referred to the question of the high price of current which had been mentioned by one or two speakers. He explained that during the greater part of the year only half the plant was required for the load, but that during one and a half months of the summer season the whole plant was fully loaded.

PRACTICAL ELECTRICAL MEASUREMENTS

AT the opening meeting of the Dublin Local Section of the Institution of Electrical Engineers, the Chairman, Mr. W. Tatlow delivered his inaugural address, which had the above title. He attributed much of the rapid progress made in electrical engineering during the past 30 years largely to the facility and accuracy with which it has been possible to measure the electrical quantities involved. Considerable benefits had also accrued to mechanical engineers, owing to the accuracy with which electrical power supplied to machinery could be measured. In the case of large generating stations it was the systematic measurement of the electrical output that had led to the measurement of various quantities involved in its production with a view to checking the cost at every stage.

The lecturer then referred to the various units involved in the measurements of electrical quantities, and the earlier forms of instruments used. Speaking of modern instruments he referred to the well known balances of Lord Kelvin, in which the forces brought into play are counterpoised by standard weights with almost the accuracy of a chemical balance.

For the purpose of checking a current balance, probably the best method is by means of a certified standard cell, and one or more certified resistances capable of carrying the required current without undue heating. An accuracy of at least ⅛ per cent. can be obtained. Two values for each resistance can be obtained if both a Clarke and a cadmium cell are available. Speaking of standard cells, Mr. Tatlow referred to the zinc chloride cell with a mercury cathode depolarised with mercurous chloride. In such a cell the pressure can be set by altering the density of the zinc chloride solution, which should have a s.g. of close on 1·38 to give one volt. The temperature coefficient determined by Hibbert is 0·000073 volt per degree centigrade, and is therefore negligible for all ordinary work. He had constructed several such cells. One made in January, 1905, and tested in February, 1905, had an E.M.F. of 0·9987 volt, and retested August, 1909, at the same temperature, gave 0·9986 volt

The choice of apparatus for the measurement of direct current in the test room of an engineering works or power station practically lies between such instruments as Kelvin balances and some form of potentiometer. The potentiometer has some decided advantages, not only in the way in which its range can be extended by the use of suitable resistances, but also in the fact that the standard cells and resistances upon which the accuracy of the measurements depend can readily be carried to other laboratories for comparison.

Regarding the measurement of resistance, the lecturer described the Lorenz apparatus. In practice resistances are usually measured by some of the well known Bridge methods, or by comparing the pressure falls over the known and unknown resistances, when traversed by the same current, by the potentiometer. The accuracy attainable is really limited by our knowledge of the temperature of the resistances under comparison. In this connection he drew attention to Prof. Callender's statement that Maxwell's rule for connecting up a bridge for maximum sensibility was often undesirable, as it involved more heating of the conductors by the current than other methods. This remark applies especially to platinum thermometry.

In the case of alternating current measurement, the difficulty is greatly enhanced by the absence of anything equivalent to the storage battery. Other complications due to eddy currents or capacity have to be guarded against, so that on the whole it is not reasonable to expect the same precision in alternating as in direct current measurements.

Mr. Tatlow recommended an alternator driven by a direct current motor, the fields of which are controlled by a resistance, as the most suitable source of current. He described a method which has been devised to control the speed of alternators used for wireless telegraphy. The turbine driving the alternator has its throttle valve controlled electrically through a contact made by the needle of a hot-wire ammeter. The speed increases until a frequency is reached at which a circuit containing capacity and self-induction, and including the hot-wire ammeter resonates, when perfect synchronism is approached, the current rises rapidly, and the needle makes contact and operates the throttle: the frequency is thus maintained within very close limits.

Mr. Tatlow concluded his address by referring to modern types of wattmeters for power measurement, and referred in appreciative terms to the Duddell oscillograph, which had played an important part in the investigation of alternating current phenomena.

Royal Institution.—Among the forthcoming lectures at the Royal Institution will be a course of six lectures by Prof. Sir J. J. Thomson on "Radiant Energy and Matter." Prof. Thomson will also give one of the Friday evening lectures.

Osram Lamps for Motor-car Lighting.—The General Electric Co., Ltd., call our attention to the following remarkable testimonial of the strength of the filaments of the small battery Osram lamps used for motor-car lighting: A well-known central station engineer, whilst motoring, recently experienced a side-slip which caused his car to charge a bank and turn over. The first thing to strike the ground was the off-headlamp, which was recovered from the wreck in a very battered condition without a particle of the front glass remaining. Out of curiosity the engineer in question switched on the lamps after the smash, and was surprised to see the Osram lamp light up amid the remains of the lantern. The lamp in question had been in service since June, 1909.

Wireless Telegraph Notes.—The Austrian Minister of Commerce has issued an order that Austrian passenger ships trading beyond Gibraltar or Aden must be fitted with wireless telegraph apparatus. The apparatus must have a range of 100 nautical miles. After November 8th, 1911, when the order comes into force, ships not equipped will not be allowed to carry passengers.

A further wireless telegraph station is to be established in the Cape Peninsula at Slangkop.

According to the *Daily Mirror*, Marconi's Wireless Telegraph Co. have offered to equip Capt. Scott's Antarctic ship, the *Terra Nova*, with wireless apparatus. If the offer is accepted, Capt. Scott would be enabled to communicate with New Zealand from King Edward VII. Land *via* two or three ships stationed at intermediate points, if this were practicable. A new wireless station is now being erected at The Bluff, New Zealand. A telephone equipment will be carried by the sledge party, who hope to keep in touch with the base by laying an aluminium wire as they proceed. (See ELECTRICAL ENGINEERING, June 30th, 1910, p. 427.)

Lieutenant Watkins, who will shortly attempt to win Baron de Forest's prize of £4,000 for a flight across the Channel on an all-British aeroplane, will carry with him a wireless apparatus developed by the Marconi Co. and Mr. T. Thorne Baker, of the *Daily Mirror* staff. The preliminary experiments of Mr. Thorne Baker were described in ELECTRICAL ENGINEERING, October 6th, 1910, p. 632.

According to the *Daily Telegraph*, Capt. E. S. Grogan, the unsuccessful candidate for the Parliamentary election in Newcastle, Staffs, commenced his election campaign on his way home from East Africa by sending wireless messages from the ship in which he was travelling.

It is announced that H.M. hired transports *Soudan*, *Bebille*, *Dongola*, *Rewa*, and *Plassey* have been fitted with wireless telegraph apparatus, and that arrangements are being made for these vessels to be kept in touch with throughout the whole of their voyage.

ELECTRIC LIGHTING OF A LARGE DRAPERY ESTABLISHMENT

PARTICULAR interest attaches to the electric lighting of Messrs. Arding & Hobbs' new premises at Clapham Junction for two reasons. First, because it is, we believe, the largest drapery establishment in London south of the Thames, and secondly, because it was in these premises that a disastrous "electrically caused" fire occurred about a year ago. In the rebuilding and in the new installation, therefore, the most approved precautions have been made to eliminate fire risk. Before proceeding to describe the electrical installation itself, one significant fact may be mentioned. The old premises which were burnt down were lighted chiefly with gas, but electric light had been employed for lighting up the Christmas show in one of the windows, and the cause of the fire was traced to the cotton-wool decorations being in too close proximity to some of the electric lamps temporarily installed in this window; yet in rebuilding it was realised that no form

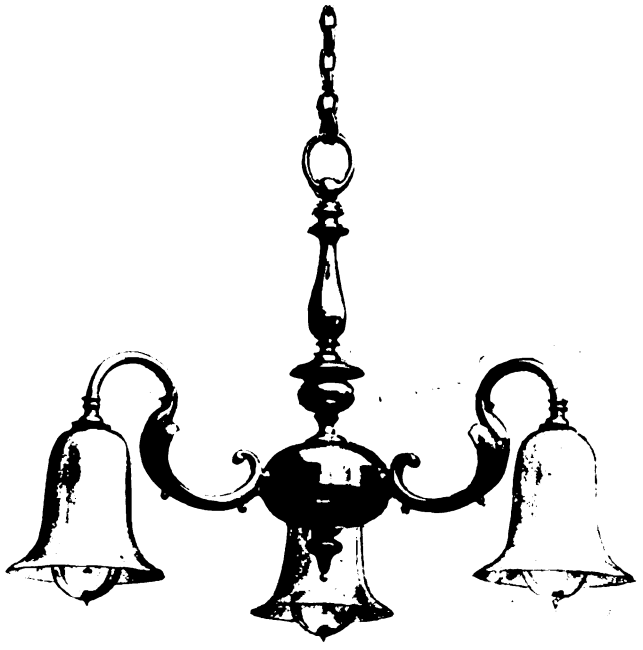

Fig. 1.—Three-lamp Pendant Fitting.

of illumination could be so safe as electric light if permanently and properly installed.

The work has been carried out by Messrs. Belshaw & Co. (53 Victoria Street, Westminster) to the specifications of Mr. S. G. Castle Russell, of 19 Lombard Street, E.C., and supply is taken from the Electricity Supply Department of the Battersea Corporation.

The building is constructed in steel and brickwork, and is divided into four sections separated by heavy brick party walls, with openings which can be closed by steel fire-proof sliding doors. There are no partition walls. One service is brought in at about the middle of the building and is divided just inside, a three-wire cable running in each direction to the two main distribution centres in the basement, situated at opposite ends of the building. The mains pressure is 460 volts, three-wire, continuous current. There is one power board at each centre, and two lighting boards, one on either side of the three-wire system. Fifteen sub-boards for lighting are controlled from one centre, and ten from the other, while each motor has a separate circuit direct from one of the main power boards.

The connections from the main boards to the twenty-five sub-boards have been made with Henley's steel-armoured lead-covered paper-insulated cables, the average size being 19/18s. These are provided with sealing boxes at each end, short lengths of C.M.A. vulcanised-rubber cable leading from the sealing boxes into the iron-clad boards through holes bushed with brass rings. The sealing boxes are provided with special bonding clamps over the armouring of the cables, and are carefully bonded to the iron-clad boards and earth. All the cables from the sub-boards to the switch centres and points are in E.S.C. solid-drawn heavy-gauge enamelled screwed conduit, with the exception of a small amount of galvanised tubing. The armoured cables and all the conduits are laid in the coke breeze under the cement covering of the ground and first floors, and under the boarding of the upper floors. From floor to floor they run in chases in the brick party walls. The conduit is not screwed into the boxes and fittings, but passes in through close-fitting holes. Brass collars are screwed over the ends to prevent chafing of the cable, and a water-tight fit and electrical continuity are secured by means of a back nut screwed on to the conduit outside the fitting.

All the main and sub-boards were constructed by Messrs.

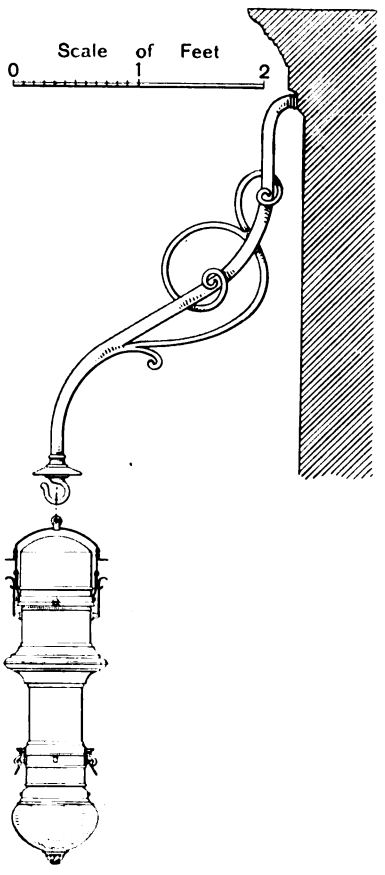

Fig. 2.—Flame Arc Lamp Bracket for Window Lighting.

Belshaw, and are of cast-iron with glass-fronted covers, and lined with uralite. The marble slabs are mounted 2 in. clear of the back of the box with ample space all round. All have face connections by means of lugs sweated on the cables. The 460-volt power boards have double fool-proof doors, giving access to only one side of the three-wire system at a time. All the larger motors are run off the outers, but five small ones are supplied at 230 volts. The main fuses for both lighting and power circuits consist of a strip of fusible metal sandwiched between two wider strips of mica to prevent splashing on blowing. The fuse is fixed between heavy terminals on a marble base enclosed in an iron box. The three-pole power switches and the two-pole lighting switches are of the Cantie quick make and break pattern enclosed in similar boxes. Porcelain tubular fuse carriers are employed on the main boards, and all the circuits are labelled. The boxes and apparatus at each of the two main distribution centres are enclosed by a fire-proof partition.

The sub-boards for arc and incandescent lighting respectively are separate. Each contains one double-pole link switch and the usual porcelain clip fuses. The incandescent lamp circuits are limited to 2½ amperes per circuit, and each arc circuit consists of two enclosed 5-ampere lamps in series. Tumbler switches are employed in all cases, and these are

Digitized by Google

grouped together wherever possible and enclosed in a light iron box with glass-fronted cover. In many cases these boxes are mounted flush with the wall, and provided with a fancy metal front through which the dolly-heads of the switches project. As many as eighteen switches are thus grouped together in some cases.

All the wiring is by vulcanised C.M.A. cable, which is drawn in from point to point. There are no elbows or T-joints, but the runs are so arranged that practically all are straight from point to point, there being only a very few drawing-in boxes. An interesting feature in connection with the wiring is the deep pattern of box used for the wall-plugs. This goes far back into the wall, and gives plenty of room for the connection of the incoming leads to the back of the socket.

The main interior lighting on the ground and first floors is by Foster "B.E." pattern enclosed arc lamps adjusted for 5½ amperes, and giving over 50 burning hours on one trim. There are about 60 lamps, connected two in series. On the first floor there are 139 three-lamp pendant fittings of the pattern illustrated in Fig. 1. These were designed and manufactured especially for the present installation by Messrs. Best & Lloyd, Ltd. (Cambray Works, Handsworth, Birmingham). Somewhat simpler fittings are employed on the other floors. Nearly 900 Mazda lamps are in use, and some 300 holophane shades. The flexible that is used for the pendants is C.M.A. 23/36 wire. The exterior lighting is by flame arc lamps. These are of the "Excello" pattern, and some 50 are in use. Fig. 2 shows the form of bracket employed. The lamps are connected five in series across the 230-volt circuits. At present the flame lamps outside are relied upon entirely for the window lighting, but in each window there are three or more wall plugs, and it is very probable that concealed window lighting by reflector lamps will be employed in some windows at a later date.

The power installation includes six lifts by Messrs. Archibald Smith & Stevens (Janus Works, Queen's Road, Battersea). The two goods lifts are of one ton and fifteen cwt. capacity respectively. These and the two service lifts are fitted with push-button control. The two passenger lifts are provided with switch control from the cages. The other power applications comprise a pneumatic cash service, ventilating fans, and several small motor-driven appliances in the catering, hairdressing, and other departments.

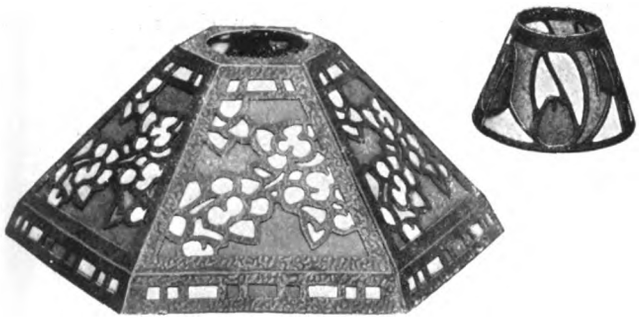
Before closing this article, we think that it will not be out of place to give a general idea of the extent and arrangement of the building itself and of the business carried on there. Messrs. Arding & Hobbs's business is one of those which have grown from small beginnings, having originally been established as one small shop in High Street, Wandsworth, thirty years ago. In 1885 new buildings were erected on the present site nearly opposite Clapham Junction Station, and the business has gradually been extended in character so as to embrace not only drapery, millinery and outfitting, but also furniture, household ironmongery, china and glass, jewellery, cutlery, toys, cut flowers, and in fact almost every branch of retail trade; there is even a restaurant, and a post office with full postal facilities. It has been found that a far wider *clientèle* is obtained than is represented by the local residents, as the large and well-stocked establishment by Clapham Junction Station attracts a shopping public from other parts of London, and from practically the whole of the districts on the London & South-Western and London, Brighton & South Coast Railways. The size of the new building is seen in Fig. 3: and a further idea of its extent will be derived from the fact that the shop-window frontage is 650 ft. long, that 300 men were employed night and day for three months to clear the site after the fire, and 500 have been working continuously during the subsequent nine months on the rebuilding work.

The General Manager, Mr. F. W. Lloyd, showed our representative over the building just before the reopening, which took place on Tuesday, and we were much impressed with the completeness and the practical nature of the arrangements. The fire-proof construction has even been carried out to the extent of employing a metal handrail instead of a wooden one on the main staircase, and the avoidance of wooden skirting at the bottom of its walls. The general construction of the building has already been indicated. No less than 1,595 Grinnell sprinklers have been fitted, which are put into action automatically from the heat of a fire, and the sides of the building facing other buildings are provided with "drenchers," which will drench the wall in the event of fire occurring opposite, and so prevent its spreading across.

Fig. 3.—General View of Messrs. Arding and Hobbs' Establishment at Clapham Junction.

In the general decoration of the rooms, the Georgian and Adam styles have been followed, and the electric light fittings illustrated, which were selected by the members of the firm themselves after an inspection of many alternative designs, are in keeping with this style. The enclosed arcs on the ground floor give a good diffused light, and are excellent for colour-matching, and the pleasing diffusion afforded by the holophane shades on the metallic filament lamps will also be appreciated.

On the second floor, a number of rooms are being furnished in different styles, to represent rooms in flats, &c., and a selection of suitable electric lighting fittings will be used in them, as Messrs. Arding and Hobbs find it advisable to include the sale of these so as to be able to undertake the whole furnishing and fitting of houses and flats.



Obituary.—The death is announced of Mr. J. H. Wray, who was for five years Borough Electrical Engineer at West Bromwich. Ill-health during the past few years had prevented Mr. Wray from following his calling as an electrical engineer.

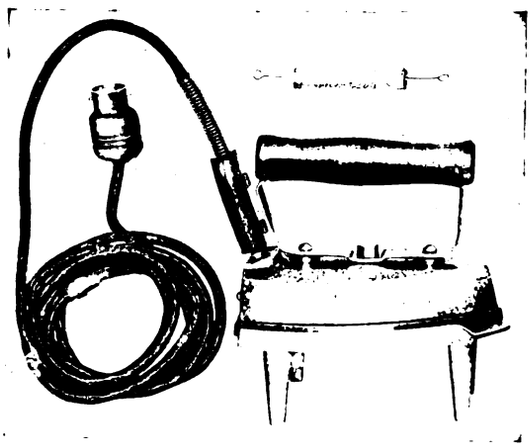
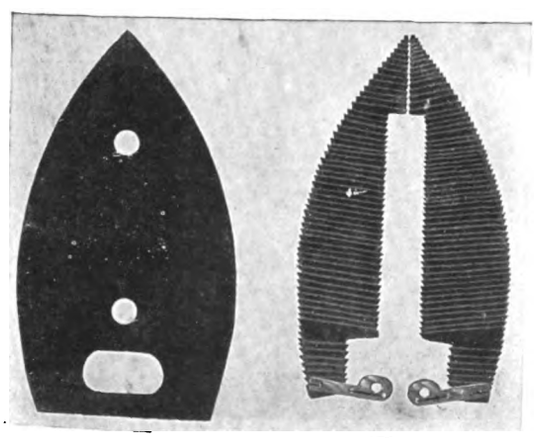
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Switches, Fittings and Accessories.

A NUMBER of new and effective designs of their well-known "Spookie" shades have been prepared for the present season by Simplex Conduits, Ltd. (113-117 Charing Cross Road, W.C.). Some of the new designs are very attractive, and considerable general improvements have been made in these shades. They are more strongly made, and by the use



New Simplex "Spookie" Shades.



of a special new form of linen paper, added richness in colouring effect has been obtained. All the new "Spookie" shades supplied have an imitation metal framing, and this is supplied in three finishes:—brown or antique green, and silver. Two of the new designs are illustrated herewith.

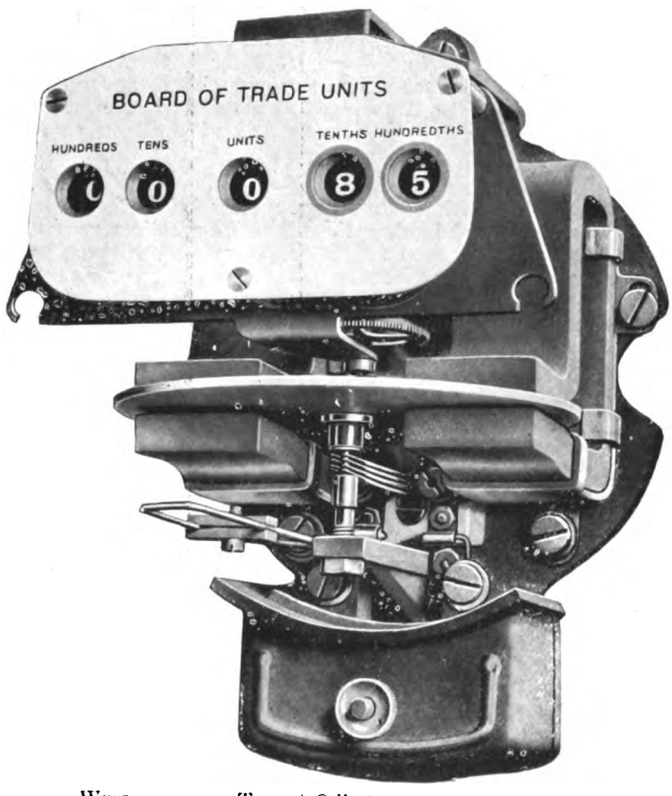
Heating and Cooking Apparatus.

The British Thomson-Houston Co., Ltd., have brought out an entirely new series of electric flat irons, which

"Calorite" Iron, complete with Adaptor and Lead on Stand.

Heating Element.

nbody considerable improvements on the earlier patterns. he heating unit is of an alloy named "calorite," which ey state is capable of withstanding oxidation to a point several hundred degrees higher than any metal previously used in heating devices, and has a melting-point of 2,370° F. Indeed, they inform us that one of these has been in circuit continuously day and night for nearly four weeks, and although the wooden handle has entirely disappeared, the heating unit is still intact. These irons are made in various sizes, suitable for all kinds of light or heavy ironing, from delicate embroideries to leather and tailoring work. The parts are fully interchangeable, and high efficiency is secured by the heat-insulating air-jacket over the top, and the close thermal contact between the heating unit and the sole of the iron. An illustration of the complete iron and of its heating unit are given here. It will be seen that the heat is supplied where it is most required, at the point, heel, and sides. The body is of two hard grey cast-iron plates, which clamp the leaf unit between them, and are held by two heavy steel bolts.



Simplex Radiator.

We illustrate herewith a simple form of four-lamp radiator, which is very moderate in price, and is one of a number of new designs contained in a new list just issued by Simplex Conduits, Ltd. (Garrison Lane, Birmingham). The list includes a variety of patterns of two-, three-, and four-lamp radiators, as well as convecters, in sizes up to those with a consumption of 2½ kw.

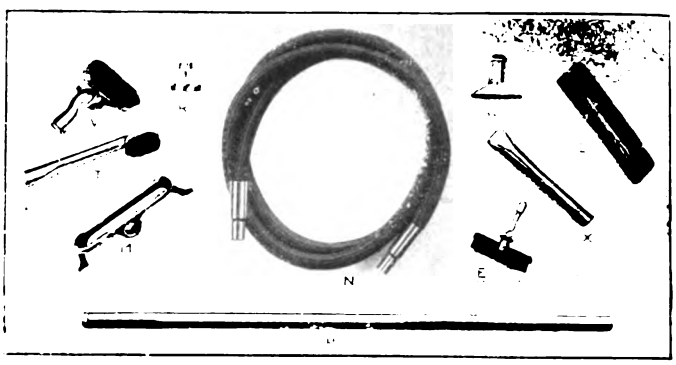
Miscellaneous.

The accompanying illustration represents a new pattern of ampere-hour meter which the British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester), have recently placed upon the market, and is known as type "O." The meter, which is shown here with the case

Westinghouse Type "O" Ampere-hour Meter.

off, is particularly designed for use on small consumers' circuits, and is of very simple construction. It is a motor-meter driven by the drop across a low-resistance shunt, which carries the main current. The armature is connected in parallel with this shunt, thus only a small proportion of the total current is carried by the commutator and brushes. An adjustable resistance gives a suitable range of speed adjustment. The armature consists of three coils of enamelled

Digitized by Google



strip, wound and arranged in an improved patented method to give a maximum torque for a minimum weight, and totally enclosed between aluminium discs. The commutator is of 18-carat gold on ivory bushes, and is of extremely small diameter. The full-load torque is 14 cm. gms., and the weight of moving element is only 20 gms. The full-load speed is 100 r.p.m. for sizes below 30 amps., above 30 amps it is 75 r.p.m. The jewel bearing is of best sapphire, and, if desired, can be supplied with a spring support. The case as well as the cover are of iron highly finished in either black or French grey stove enamel. Clock-face or cyclometer dials are supplied as desired, which can be arranged to read either ampere-hours or B.O.T. units. The cyclometer dial is of

Electric "Kleenall."
(General Electric Co., Ltd.)

special construction with a novel springing device which prevents the halving of figures when turning over. The meter is extremely small and light, and an efficient washer renders it completely proof against damp, dust, or dirt. All these meters can be supplied for use on two-wire circuits up to 500 volts, and for capacities from 1 to 200 amps. inclusive. The degree of accuracy obtained is guaranteed within 2 per cent. from 25 per cent. overload to 1/20 of full load. Switchboard as well as house-service patterns are made.

The General Electric Co. are now putting before the trade an improved form of light, self-contained domestic vacuum-cleaner, which has several points to recommend it, both to the consumer as an efficient means of dust removal, and to the supply authority as a current-consuming device. The apparatus is now known as the electric "Kleenall," and embodies improvements on the similar type of apparatus introduced some months ago. The appliance consists of a vertical spindle motor driving a centrifugal exhausting fan immediately over the wide nozzle, and a bag is provided for the reception of the dust. The whole is attached to a long handle, and is light enough to be used as a broom for carpet cleaning. When employed in this way a brush can be fitted inside the nozzle, so that it is vibrated by the motor, and assists the disengagement of the dust. In addition to being used in this way, a series of attachments are provided, by which cleaning of objects, hangings, and decorations in any part of a room can be carried out by simply clipping on the shoe *M* to the wide nozzle, and laying the apparatus down on the floor. A flexible hose, with any one of the numerous forms of nozzle illustrated, can then be attached, and the apparatus used as a stationary suction cleaner. Again, for

Spare Attachments for Electric "Kleenall."

Broadbent Patent Shade Remover. (Sun Electric Co., Ltd.)
(Scale, one-third full size.)

some purposes the hose may be attached to the delivery side of the pump, and used as a blower for removing dust from surfaces difficult to reach with a suction nozzle.

Among the novelties recently introduced by the Sun Electrical Co., Ltd. (118-120 Charing Cross Road), is a very convenient special tool for removing shade rings in cases where the shade is too narrow for the hand to reach the ring. The tool is illustrated above. The ring is held by a number of spring jaws, which are attached to a metal disc free to slide within the external brass tube mounted on the handle. These springs are so shaped that they close tightly on the ring as the outer tube is pressed over them. Thus to pick up a ring from a flat surface, the jaws are first shut or pulled out and placed over the ring, and the handle pressed down, when the ring is tightly gripped and can be slipped into place. Pulling the handle will, of course, disengage the jaws. A shade ring can be laid hold of for removal in a similar way.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

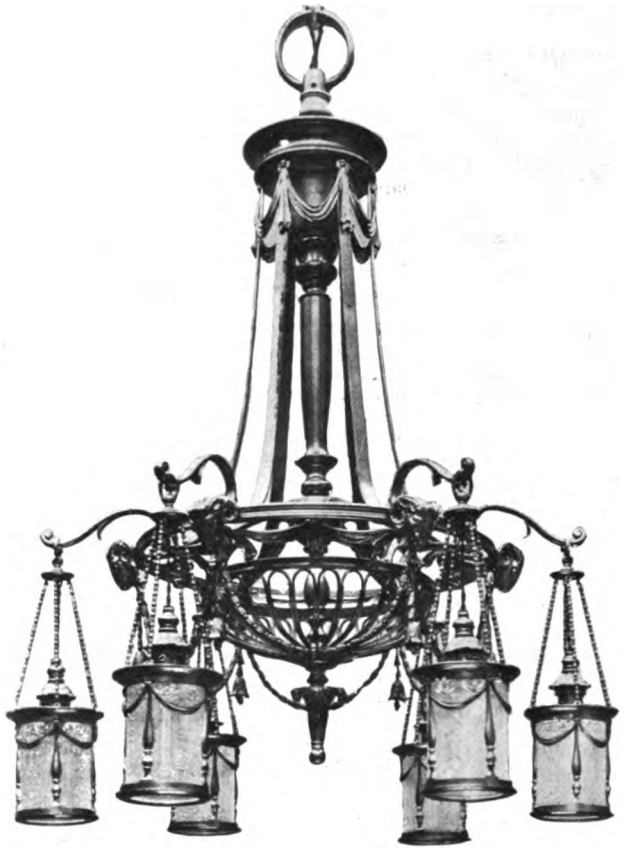
ILLUMINATION.—Holophane, Ltd. (12 Carteret Street, Queen Anne's Gate, S.W.) have produced the first issue of a monthly publication entitled "Holophane Illumination." This will contain particulars of the latest patterns of Holophane globes and reflectors and methods of using them. The present issue includes photographs of Holophane installations; some notes on Holophane reflectors for church lighting, and a description of the new "Stiletto" type reflectors. Particulars and illustrations of Holophane fittings were given in a special article on lighting in Electrical Engineering, Oct. 20th, 1910, p. 657. Any of our readers who desire to have information with regard to the principle of light distribution by holophane shades should apply to the company for a copy of this publication, which, we understand, is being circulated free of charge.

METAL FILAMENT LAMPS.—Mr. G. Braulik (8 Lambeth Hill, Queen Victoria Street, E.C.) sends us lists of "Eclipse" colloid-tungsten metal filament lamps, which are made in sizes from 9 to 1,000 c.p., and for various voltages from 25 to 260.

SMALL MOTORS, COILS, BELLS, &c.—Another list from the same firm deals with toy and other miniature motors, cheap induction coils, bells, and novelties.

RESISTANCE NETS. A large sheet mounted for hanging on the wall is being issued by H. H. Cressall, 13 Summer Row, Birmingham, who, as announced in our last issue, has taken up the British agency of Schniewindt's patent asbestos woven resistance nets. Illustrations are given of various forms, suitable for motor starters, heating, and other purposes, and tables of technical data and prices are given.

DYNAMOS.—A new list of continuous current generators has been issued by Crompton and Co., Ltd. (Salisbury House, London Wall, E.C.). Open type machines are only listed from 5 to 250 kw., but the firm are, of course, prepared to quote for machines of larger size. The machines listed are manufactured from seventeen standard sizes of frame, and for each size a large number of windings have been standardised, which give a complete range of outputs and speeds for all ordinary work.



SIGN FLASHERS.—A new leaflet from the Sun Electrical Co., 118-120 Charing Cross Road, describes the automatic clock-controlled mercury contact magnetic sign-flashing switches the company have recently introduced. This excellent piece of apparatus was illustrated and full particulars of its working were given in the special article on electric signs in Electrical Engineering, October 20th.

SWITCHGEAR.—A set of leaflets in a convenient cover is to hand from the Switchgear Company, Ltd. (Newhall Street, Birmingham). Among the apparatus dealt with are quick-break blow-out fuses for continuous current, Statter's patent quick-break blow-out and other circuit-breakers, switch fuses, quick-break knife switches, and the latest forms of the Statter discriminative lag apparatus, which can be applied to all forms of circuit-breaker, relays for generator and feeder protection, &c. This presents great advantages owing to the relation between the lag and overload that can be obtained. Further leaflets describe many oil switches and oil-immersed star-delta starting switches.

OSLER'S NEW SHOWROOMS

WE recently had an opportunity of inspecting the showrooms of Messrs. F. & C. Osler, Ltd. (100 Oxford Street, London), which have been considerably extended, and we are enabled to illustrate one of the

A Fine Adam-style Electrolier.

new rooms and also two of the many pleasing designs of fittings which are adequately displayed there. The reputation of this firm for cut glass is a very high one, and the array of beautiful glassware of all classes in their establishment is probably second to none in

A Two-light Bracket.

London; it is not so well known, however, that the firm manufacture at their works in Birmingham not only glass but also metal fittings of an equally high quality and finish, and that, besides the more elaborate and costly ones, they stock a number of less expensive patterns, some of them quite equal in artistic merit and all equal in workmanship and finish to the class of fittings which has made their name.

The extension of the showrooms consists mainly of six smaller rooms opening out of the large gallery in Oxford Street. Each room is devoted to a particular style. In one some really beautiful electroliers and brackets in the Adam style are shown, and we illustrate one of the most prominent of these. Another room is devoted to Georgian and Tudor. In the "pillared hall," which we illustrate, some extremely pleasing patterns are shown, in which Sheraton, Chippendale, and Grinling Gibbons designs are embodied. There is a panelled room for miscellaneous fittings, including the various French styles, and a "Gothic" room, with stone walls, is employed to display church fittings and those of similar character.

We illustrated in our issue of November 17th the cut glass dish fittings chosen for the Institution of Electrical Engineers Building, and various sizes and patterns of these are shown, as this design will always remain one of the most popular. In some of the dish or bowl

The "Pillared Hall."

pattern fittings a modification of the design has been introduced to soften the glare. The glass is cut in pillars and "acided" inside so that each pillar acts as a lens, and while the light is softened there is no undue loss of illumination.

A feature that we greatly appreciated in the Osler fittings is the selection of the shades. Many fittings which one sees in houses are spoilt by the use in them of ordinary stock shades which are not in keeping with the character of the fittings, but as Messrs. Osler manufacture their own shades, every one of them is selected to harmonise perfectly with the general scheme.

Serious Fire at Derby.—The Derby Electricity Works had a very narrow escape from being involved in a fire which broke out in the early hours of Monday morning at Messrs. Sowter & Co.'s flour mills, almost adjoining the station. The fire was one of the most serious that has been known in Derby, and both the flour mills and the major portion of the building known as the old silk mill were entirely gutted, the flames being favoured by the high wind prevailing. The Derby Fire Brigade, with assistance from the Midland Railway Brigade and that of Messrs. Bemrose & Co., succeeded in preventing the fire spreading to other buildings, but it was not until six o'clock in the evening that the engines stopped playing. Fortunately no damage was done to the electricity works; and although Mr. T. P. Wilmshurst (Borough Electrical Engineer), who was himself called to the scene in the night, informs us that the heat in the station was terrific, there was no interruption of the supply.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published December 1st, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

5,035/10. **Knife Switch.** M. J. Railing and C. C. Garrard. (General Electric Co., Witton.) This specification describes a quick-break switch provided with a double-acting spring for preventing the closing of the switch by vibration or when inverted. Closing the switch puts one half of the spring under tension, and in opening the switch the other half is put under tension, so that a very quick break is effected. Three figures.

8,858/10. **Earthing of Wiring Fittings.** J. J. Rawlings (London). The insulating base of a tumbler switch or other fitting is recessed to receive a strip metal spring which is forced into contact with the cover when the latter is screwed on. The strip is connected to the conduit or other earthing system. Four figures.

9,547/10. **Shade Holder.** H. A. Beard and J. W. Townsend (Banbury, Oxon.). The shade is supported by a sleeve, which is placed over the lamp cap before inserting the lamp in the socket. The sleeve has a grooved flange at the bottom which rests on the bayonet pins, and a spring flange at the top to grip the shade and prevent it rattling. Nine figures.

18,443/10. **Electrically-controlled Switch.** Adams Manufacturing Co., Ltd. (*Cutler Hammer Manufacturing Co., U.S.A.*). The switch is provided with links forming a self-locking toggle for holding the switch closed after the temporary energising of the operating solenoid. In the closed position a weighted lever bears against the toggle to lock it, but on energising the tripping solenoid, the lever delivers a hammer blow to the toggle and releases it. Seven figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Ingle [Insulating materials] 1,021/10; Haefely [Winding apparatus for coils] 18,151/10.

Dynamos, Motors, and Transformers: Siemens Bros. Dynamo Works and Holmes [Electrical marine propulsion] 28,804/09.

Electric Ignition: Turner and Fenwick [Magneto machine] 27,624/09; Etablissements de Dion Bouton (Soc. Anon.), 5,510/10; Haddan (*Lesperance*), 6,650/10.

Electrometallurgy and Electrochemistry: Preston [Primary cells] 26,683/09; Soc. Anon. Electrométallurgique (Procédés Paul Girod) [Three-phase furnaces] 3,421/10; Frost [Galvanising process] 9,352/10; Thomson and FitzGerald [Electric furnaces] 11,717/10.

Incandescent Lamps: Wolfram Lampen A.-G. [Process for decarbonising metal filaments] 14,116/10.

Storage Batteries: Tate [Regenerating batteries] 2,513/10.

Switchgear, Fuses, and Fittings: Cowper-Coles [Lamps] 26,888/09; Bourne [Four-way switch] 26,899/09; Bonella [Wall plugs] 29,506/09; Nash and Western Electric Co. [Relays] 752/10; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co., U.S.A.*) [Rheostats] 2,749/10; Wolf, Bambury and Bernardy [Lamp brackets and pendants] 3,822/10; Henkel [Motor controllers] 3,847/10; Electric & Ordnance Accessories Co. and Collins [Time limit devices for circuit-breakers] 12,708/10; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Circuit-breakers] 13,520/10; Sweetser and Electric Sign & General Advertising Co. [Switch] 15,037/10.

Telephony and Telegraphy: Goldschmidt [High-frequency generator for wireless telegraphy and telephony] 11,294/10; Eisenstein [High-frequency impulse generator for wireless telegraphy and telephony] 16,354/10.

Traction: Marks (*California Valve and Air Brake Co.*) [Air brakes] 10,826/10; Schaeffer [Operation of tramway points] 18,513/10; Siemens Bros. & Co. and Ferreira [Operation of railway points] 19,969/10.

Miscellaneous: Schwarz [Heat accumulators] 26,376/09; Macfarlane [Electrically-driven centrifugal machines] 26,406/09; Mavor & Coulson, Ltd., and Mavor [Coal conveyers] 26,531/09; A.-G. Brown, Boveri & Cie [Gas turbine] 26,712/09, 27,217/09, 27,219/09, and 27,220/09; Taylor [Hand tool for grinding commutators] 4,724/10; Bourck [Temperature and fire alarm] 9,364/10; Melling [Winding and hauling engines] 13,152/10; Shaw [Prevention of overwinding] 14,927/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: A.-G. Brown, Boveri & Cie [Repulsion motor generators] 25,473/10.

Electric Ignition: Herz [Sparking plugs] 25,539/10.

Electrochemistry, &c.: Langbein Pfanhauser-Werke A.-G. [Manufacture of electrolytic iron] 25,092/10, and 25,969/10; Consortium für Elektrochemische Industrie Ges. [Production of acetylene tetrachloride] 25,967/10.

Incandescent Lamps: Westinghouse Metallfaden Glühlampenfabrik Ges. [Process for decarbonising metal filaments] 24,637/10.

Switchgear, &c.: Lange [Electrical remote control system] 26,268/10; Reiniger Gebbert & Schall A.-G. [Mercury contact breakers] 26,341/10.

Telephony: Telephon Apparat Fabrik E. Zwietusch & Co. [Automatic telephone exchanges] 26,079/10.

Miscellaneous: Scherl [Gyroscopic stability mechanism] 27,838/09; Aktiebolaget Ljungströns Angturbin [Gas turbine] 24,137/10.

Opposition to Grant of Patents

2,215/09. **Steam Turbines.** G. Belluzzo. This patent has been granted in spite of opposition. It covers the balancing of the axial thrust by the admission of steam at an intermediate pressure to special chambers situated at both ends of the turbine.

10,791/09. **Battery Electrolyte.** G. Schauli. This patent has also been granted. The specification, abstracted in Electrical Engineering, June 2nd, 1910, p. 364, relates to a mixture of flaked rice, zinc chloride, and ammonium chloride.

21,008/09. **Arc Lamp.** L. D. Cibie. Opposition has been entered to the grant of this patent. The specification, abstracted in Electrical Engineering, Oct. 13th, p. 648, describes a lamp in which one carbon is guided in a socket having a spherical bearing and rests on a stop attached to this socket.

Restoration of Patent

14,851/06. **Telephone Exchanges.** Kjöbenhavns Telefon Aktieselskab. This patent, which expired in 1909 owing to non-payment of the renewal fee, has been restored to Aktiebolaget L. M. Ericsson & Co. It covers apparatus for the automatic distribution of the operating service in telephone exchanges.

Amendments

15,802/09. **Ignition Apparatus.** B. Brooks and F. H. Alston. A disclaiming note has been inserted in this specification. The patent covers the use of the induction coil itself as the revolving part of the H.-T. distributor, thus eliminating some of the rubbing contacts.

16,405/09. **Combined Massaging and Magneto Machine.** F. Burks. A statutory reference to Specification No. 12,844 of 1909 has been inserted in this specification, which describes a massaging machine with a metal roller for conveying a current to the body from a magneto geared to the roller.

5,043/10. **Bicycle Lamp Dynamo.** C. Schlick. A disclaiming note has been added to this specification, which describes a permanent magnet generator with a spring holder for bringing the armature pulley into contact with the tyre.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

28,612 of 1896. **Intercommunication Telephones.** A. J. Boult (*Soc. Anon. de Téléphonie Privée, Brussels*). This patent covers telephone apparatus for use in private installations in which the stations are connected with each other by means of multiple contact switches. Separate batteries are employed, and only that of the station required for conversation is put in circuit, thus avoiding interference due to the other currents in the common return conductor. A special Hunnings transmitter is also described.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: H. Leitner and R. N. Lucas [Train-lighting dynamo and system] 17,601/03; H. Hill [Storage-battery train-lighting system] 17,602/03 and [Train-lighting system with dynamo] 17,764/04.

Instruments, &c.: H. T. Harrison [Electrolytic meter] 17,632/03.

Switchgear, &c.: F. W. Manley [Reversing switch for train-lighting dynamo] 17,603/03.

Telephony, &c.: W. L. Wise (*C. L. Buckingham, U.S.A.*) [Telegraphic tape perforator] 14,637/00; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Group-calling system for telephone exchanges] 16,484/05.

Miscellaneous: E. G. Hoffmann [Ball thrust bearings] 16,517/99; G. C. Marks (*M. B. Church, U.S.A.*) [Bevel gears for automobile motors] 16,577/05.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, DECEMBER 8TH.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. "The Magnetic Properties of Iron and its Alloys in Intense Fields," by Sir Robert Hadfield, F.R.S., and Prof. B. Hopkinson, F.R.S.

Institution of Electrical Engineers: Dublin Section.

8.20 p.m. At Royal College of Science.

Rugby Engineering Society.

8 p.m. At 29 Regent Street, Rugby. "Electricity in the Himalayas," by B. F. McMurtrie.

FRIDAY, DECEMBER 9TH.

Illuminating Engineering Society.

8 p.m. At Royal Society of Arts. "Recent Progress in Electric Lighting," by Prof. E. W. Marchant.

SATURDAY, DECEMBER 10TH.

Birmingham and District Electric Club.

7 p.m. Annual General Meeting at Colonnade Hotel, New Street.

MONDAY, DECEMBER 12TH.

Institution of Electrical Engineers: Newcastle Section.

8 p.m. At Armstrong College. Discussion on "Electric Winders."

Royal Society of Arts.

8 p.m. Cantor Lecture IV. "Industrial Pyrometry," by C. R. Darling.

TUESDAY, DECEMBER 13TH.

National Electrical Manufacturers' Association.

2.30 p.m. Special General Meeting at Balfour House, Finsbury Pavement, London.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At School of Technology. "Organisation and the Reduction of Manufacturing Costs," by A. R. Stelling.

Institution of Electrical Engineers: Yorkshire Section.

7.45 p.m. Reception and Smoking Concert, Hotel Metropole, Leeds.

Institution of Electrical Engineers: Glasgow Section.

8 p.m. At 207 Bath Street.

Faraday Society.

8 p.m. At Institution of Electrical Engineers, Victoria Embankment. (1) "New Apparatus for the Rapid Electro-Analytical Determination of Metals," by H. J. S. Sand and W. M. Smalley. (2) Mr. R. W. Paul will exhibit some new pyrometers and resistance thermometers, and some low and high reading amperemeters, &c.

WEDNESDAY, DECEMBER 14TH.

Institution of Electrical Engineers: Glasgow Section.

Annual Dinner.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. At the University. "Street Lighting by Modern Electric Lamps," by H. T. Harrison.

Institution of Electrical Engineers: Students' Section.

7.30 p.m. At Victoria Embankment. "Progress in Arc Lamps," by J. F. Shipley.

Junior Institution of Engineers.

7.30 p.m. At Royal United Service Institution, London. "Some Recent Developments in Condensing Plant," by G. L. Kothny.

THURSDAY, DECEMBER 15TH.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. "Submarine Cables for Long-Distance Telephone Circuits," by Major W. A. J. O'Meara.

FRIDAY, DECEMBER 16TH.

Electro Harmonic Society.

8 p.m. Smoking Concert, at Holborn Restaurant.

SATURDAY, DECEMBER 17TH.

Junior Institution of Engineers.

3 p.m. Visit to G.P.O. Power Station, Blackfriars.

FROM THE WIRING CONTRACTORS' POINT OF VIEW

IT will not be long before preparations are in hand for street illumination and other temporary lighting for the Coronation. The matter has already been under the consideration of the Fire Brigade Committee of the London County Council, and, as we have already announced, a short series of seven recommendations has been drawn up by the chief officer pointing out such precautions as are advisable from the fire risk point of view. The Council have, of course, no power to impose compliance with any actual regulations, and these rules are more of the nature of advice. They contain much that is universally admitted to be essential to good practice, but the importance of sound work on temporary installations can never be repeated too often.

The Fire Brigade would have every installation tested and approved by the supply authority before connecting up, but we should imagine that, unless the companies are prepared to enlarge their staffs considerably, this will be difficult of universal accomplishment. Adequate fusing of both poles of all circuits and sub-circuits is required, and the latter are limited to 2 kw.—by no means too low a figure. Bare conductors are rightly entirely tabooed, and the importance of earthing of all metal conduits and coverings is emphasised. Festoons, garlands, &c., must have supports independent from the conductors, and an important hint is given that the effect of wind must not be overlooked in their design, and another rule reads as follows:—All shades and decorations of combustible materials in proximity to lamps should be rendered non-inflammable by a process which will withstand the action of rain for several days, and no shades or decorations of celluloid or similar substance should be used. It is also recommended that the installations should be connected, where practicable, at the main intake, or at the main distribution boards, so as to avoid the possible overloading of the house wiring, advice which the careful wiring contractor will hardly require, but which it is desirable to publish for the benefit of the consumer, who might be tempted to try his hand at amateur work. Illuminations are in use for several hours at a stretch, and therefore the overloading of the house circuits might lead to disastrous results. Copies of these recommendations are being sent to all the supply authorities in the London district.

The Conference between representatives of the Incorporated Municipal Electrical Association and the Electrical Contractors' Association will be resumed on Friday. In the meantime it may be noted that the Municipal Wiring Bill is not among the private Bills deposited for the coming session of Parliament in the ordinary course. If, therefore, it is still deemed advisable by the I.M.E.A. to proceed with a Bill after the Conference, the only course left is a "late Bill," a Private Member's Bill, or a Government Bill. The first of these procedures is not likely to be followed, as there is no intention to push forward a Bill hurriedly, and procedure by Private Bill would be complicated, as it would probably necessitate every Corporation included in the Bill being one of the promoters, or at any rate assenting to it in all its clauses. It must also not be forgotten that several corporations already possess the powers sought. A Private Member's Bill of so controversial a nature would stand practically no chance of passing into law, and the possibilities of a Government measure being introduced can hardly be discussed with any degree of assurance at the present time. Failing compromise between the two sides to the Conference, we anticipate that the ultimate result will be that those Corporations desiring wiring powers will proceed each with their own Bill as heretofore. The requisite clauses would then either be embodied in omnibus Bills, as has been the usual course, or would form short Bills. In the latter case it might certainly be found possible to have all the Bills considered simultaneously, and to have joint representation by counsel to save expense. The Electrical Contractors' Association, however, should not rely upon the technical obstacles we have named, and take up an absolutely irreconcilable attitude, as, if the breach is widened, hostilities might be opened very effectively from the municipal side by those Corporations who have wiring powers which they have not yet exercised, deciding to test their efficacy. In the meantime there is an enormous amount of wiring work ready for useful canvassing all over the country.

Loom Motors.—A new leaflet from the Electric Construction Co., Ltd. (Wolverhampton), describes a special form of spring-mounted enclosed squirrel-cage induction motor with high starting torque, good efficiency over a wide range of load, and small drop of speed on full load, which the company have specially developed for use in textile factories.

THE G.B. SYSTEM IN THE MILE END ROAD

£12,000 Damages against Sir John Benn

THE libel action by Messrs. Griffiths & Bedell against Sir John Benn in respect of certain statements made by him relating to the G.B. surface contact system in the Mile End Road, concluded on Thursday with a verdict for the plaintiffs on all the questions put to the jury except one, general damages being assessed at £12,000.

On Wednesday last week the final speeches to the jury and the judge's summing-up took place. Mr. Greer, K.C., for Messrs. Griffiths & Bedell, said he had been thinking over the suggestion made by Mr. Justice Ridley that the alleged libels at the London County Council were privileged and might be ignored, but thought he could hardly agree with the suggestion. Mr. Justice Ridley said he also had come to the same conclusion after thinking the matter over.

Sir EDWARD CLARKE contended that the system had proved inefficient in the Mile End Road, and that as Sir John Benn's statements referred only to that system, they were true, and perfectly justified by the position that he held in relation to London government. Even had the system proved successful after further trials, it would still have been an inefficient system rendered efficient by the application of Mr. Mordey's patent. During the course of this speech, Mr. Justice Ridley interposed with the remark that he did not consider the London County Council came into the question at all, nor that their officials were on their defence. It was simply a question of libel or not.

Sir Edward Clarke, in dealing with the question of special damages, contended that there was no evidence of this, as it had not been proved that contracts had been lost at any of the places mentioned in the evidence through the result of the Mile End Road experiment. He also drew attention to the fact that Sir John Benn had made no statements until after the Highways Committee had recommended that the system should be abandoned, and consequently any statement he might have made subsequently could not have influenced their decision.

Mr. GREER said that his case was that Sir John Benn had gone out of his way to attack the system as a system. He did not allege that the Moderate party had improperly used the system, but he had called it a mischievous and impossible system which had imperilled the lives of man and beast, and that had received the condemnation of all competent experts. Anything more likely to hamper and injure the business prospects of the inventor, and the gentleman who had spent his money in an effort to develop the system, he could not imagine. This was the reason why it had been necessary to go into the merits of the system, but he wished to say that he raised no question as to the *bona fides* or competence of the L.C.C. officials. He was quite aware that comments upon the officials had been made by Mr. Smith in his opening speech, but that was before the facts were developed. He must say, however, that having passed their judgment upon the system, the officials of the London County Council could not, in the nature of things, possess that open mind to judge the results of the experiments carried out by Mr. Mordey. It could not be disputed that the system had had a bad start in the Mile End Road, from which it never recovered.

Mr. Greer then reviewed the evidence at some length.

Mr. JUSTICE RIDLEY, in summing-up, put nine questions for the jury to answer. On the question of malice he said this did not necessarily mean spite against the person, but could be the suggestion of corrupt or wrong motives. Statements recklessly made would come within this meaning, but it was necessary for the plaintiffs to show evidence of malice. In order that special damages could be recovered it would have to be shown that injury had been directly caused by the statements made, such as the loss of customers. The jury returned a verdict for the plaintiffs on the grounds that the words complained of were defamatory; that they were statements of fact, and not opinion; many of the statements were untrue; that they referred to the G.B. system in the Mile End Road, and also generally; and that, except in the L.C.C. speeches, malice was proved. The jury disagreed on the question of special damage, but gave general damages of £12,000, to be divided equally between Mr. Griffiths and Mr. Bedell.

A stay of execution was granted with a view to an appeal, security being given for £5,000 within ten days.

Fire.—The works of Messrs. Taylor, Tunnicliff & Co., makers of porcelain insulating materials, Hanley, were considerably damaged by fire on Friday. Fortunately most of the machinery destroyed is duplicated in other parts of the works.

Obituary.—We regret to have to record the death, on November 20th last, of Herr Rudolf Wolf, the founder of the well-known works at Magdeburg, Buckau (Germany), for the manufacture of locomobiles, or semi-portable self-contained engine and boiler sets. Herr Wolf, who had reached the age of seventy-nine, had, during his career, achieved remarkable success in the development of the superheated steam locomobile into an economical and convenient form of steam power plant.

THE GERMAN ELECTRICAL INDUSTRY IN 1909-10

IN his annual report upon the trade and commerce of Frankfort for the year to April, 1910, Sir Francis Oppenheimer makes a few references to the electrical industry. The new tax on electric lamps and burners came into operation on October 1st, 1909. The factories producing these articles during the months preceding the introduction of the tax were occupied to the extent of four or five times their normal occupation, and the demand was so keen that prices were raised, and new orders only accepted at an average increase of 25 per cent. An additional revenue of twenty million marks is expected from this new tax, and early in 1910 it has brought a surplus of 1,300,000 marks over the estimated yield for the period. (According to the *Elektrotechnischer Anzeiger*, however, the revenue for the first eleven months from the date of the imposition of the tax was only 9,730,000 marks, or about half of what was expected. Further details from this source are given below.)

Dealing with the industrial position during the year, Sir Francis Oppenheimer states that the shares of the electrical manufacturing companies were popular throughout the year, and, even in the slump early in the year, proved favourites for speculative and investing purposes. When increased dividends were declared in the autumn, the quotations of the shares in the two leading concerns were found to have risen 50 and 40 per cent. respectively compared with the beginning of the year. The Felten-Guilleaume-Lahmeyer Works did not share in the general electrical boom, and their shares declined in 1909.

It is also pointed out that electric power stations to supply certain districts are being erected in increasing numbers close to the coal mines. Such stations exist already at Weissenfels, Helmstadt, Schwandorf (Oberpfalz). The latest addition is at Zittau, to supply the Oberlausitz with electricity. A very vast scheme of this kind is at present being discussed, namely, a central power station established in the Halle district for supplying Berlin with electricity.

Systematic experiments are being carried on in an experimental station near Berlin to ascertain the effect of electric currents upon the growth of various kinds of plants. It is hoped that eventually the experiments may lead to practical results, and thus a very important use may be devised for the numerous power stations which are being established in agricultural districts, thus far chiefly for the working of agricultural machinery.

According to the *Elektrotechnischer Anzeiger*, an official report states that the revenue from the German tax on illuminating apparatus for the quarter, October 1st, 1909, to March 31st, 1910, has been much less than that estimated by the Government. Particulars of the tax were given in ELECTRICAL ENGINEERING, July 29th, 1909, Vol. V., p. 693. The number of articles on which the tax was imposed during the quarter were as follows:—10,250,000 electric incandescent lamps, 1,600,000 kg. of arc lamp carbons, and 14,850,000 gas mantles. The estimated figures were 15,000,000, 3,500,000, and 50,000,000 respectively. The revenue for the eleven months from October 1st, 1909 (when the tax came into force), to August 31st, 1910, was 9,730,000 marks (approximately £486,000); while, according to the estimates of the Government, it should have been 21,500,000 marks (approximately £1,075,000). This result cannot be due to the laying in of large stocks by big consumers, as the tax was applied to these stocks also. It is stated that one result of the tax has been that consumers have not renewed their lamps and mantles so often.

Telegraph Traffic.—It is officially announced that telegrams for Uruguay are no longer subject to censorship. The submarine cable between Obock and Djibouti was restored to working order on November 30th. On November 15th the British Administration will open telegraphic communication with Berbera, in British Somaliland, by means of wireless stations at this place and at Aden; the installation is to be regarded as an extension of the ordinary telegraph system.

An Edison Storage Battery Tramcar.—The *Electric Railway Journal* (New York) contains a description of a double-truck tramcar driven by Edison batteries, destined for one of the New York lines. The car is somewhat larger than the Edison battery car described in ELECTRICAL ENGINEERING of May 19th (p. 515), and is also designed by Mr. R. Beach. The battery consists of 190 type A8 cells. The car is 23 ft. long, seats 40 passengers, and is of the single-deck pattern on two maximum traction trucks of very novel design. These have fixed axles upon which the wheels run on roller bearings. The driving wheels are 30 in. in diameter, and each is driven through a Morse silent chain by an 85-volt G.E. 1022 automobile type motor. The speed reduction is 3½ to 1. The weight of the car complete is 15 tons. The maximum speed is 35 m.p.h. The average power consumption is given as 650-watt hours per car mile, and an acceleration of 1 m.p.h. per sec. is said to be obtainable on level track.

MAIN LINE ELECTRIFICATION PROPOSALS IN BOSTON, U.S.A.

In accordance with a resolution of the Massachusetts Legislature, the railway companies having lines terminating in Boston, namely, the New York, New Haven & Hartford, the Boston & Maine, and the Boston & Albany Railroads, have submitted reports on the electrification of their lines within the metropolitan district of Boston to a Commission which is to prepare a Bill to place before the next Legislature providing for the compulsory electrification of all standard gauge lines in the district within a stated time. The zone in question reaches about 15 miles from Boston, and on a few branches to 20 miles. The estimated cost of the equipment for the New York, New Haven & Hartford lines is approximately £2,772,000; for the Boston & Maine, £3,778,000; and for the Boston & Albany, £1,282,000, or a total of nearly eight million, exclusive of the capital to be written off in respect of the displaced steam rolling-stock.

In a joint report for the first two railways, Mr. E. H. McHenry, Vice-President of the New York, New Haven & Hartford Railroad, gives full estimates for the cost of the scheme, based on the single-phase system as adopted on the New York end of his company's line with a trolley-wire pressure of 11,000 volts and a frequency of 25 cycles. He points out that electrification of all the sections within the district of Boston only is not the method of development which would be chosen by the companies concerned, as it will involve the erection of costly intermediate stations at some thirteen points on the district boundaries for effecting the change-over from steam to electric locomotives and *vice versa*. The companies would rather at first restrict the replacement of steam by electric traction to a few of the more important routes, subsequently extending the system as rapidly as consistent with the financial conditions and the development of the traffic. The estimates for the two railways cover the requirements of the passenger traffic only, and include some £1,200,000 for a power station, and £770,000 for the distribution system and overhead equipment. A total length of 461 miles of single track would have to be equipped, but no sub-stations would be required. A sum of about £363,000 is estimated for the suburban terminal stations and repair shops. 162 electric locomotives, 232 multiple-unit motor coaches, and 377 trailer cars are provided for. This equipment provides for a traffic of 17,286 train-miles per day, according to the time-tables, and an additional 50 per cent. for holiday service. It is stated that, notwithstanding the greater traffic density at New York, the electric service of the New York, New Haven & Hartford Railroad not only fails to earn any interest upon the extra capital invested, but that it has also increased the cost of working. This is partly explained by the fact that the steam service is still retained to a considerable extent, and that the capacity of the power stations between the peaks of passenger traffic is not utilised for goods traffic. Mr. McHenry concludes that no general substitution of electric for steam traction should be made unless it includes both passenger and goods traffic and shunting, and also extends to the full length of run or engine district in order to avoid intermediate engine change-over stations.

The report for the Boston & Albany Railroad was submitted by Mr. A. H. Smith, Vice-President of the New York Central & Hudson River Railroad, who are lessees of this line. The estimates cover the equipment of 128 miles of track, or somewhat over 20 miles of route, including four miles outside the Boston district boundary in order to reach a station suitable as a change-over point. The system chosen is a third-rail equipment with continuous current at 1,200 volts, and rolling stock similar to that employed on the New York Central & Hudson River line in New York. The present service would require 16 locomotives, 62 motor coaches, and 31 trailer cars. It is pointed out that the present working expenses are already in excess of the gross receipts, and that the additional annual charge for electrical equipment would necessitate increased fares.

AN ELECTRICALLY-DRIVEN TOOL WORKS

A TRIAL of the electric motor on one or two machines resulted recently in the partial electrical equipment of the works of the well-known firm of Thomas Smith & Sons, of Saltley, where stampings and drop forgings for various classes of work are made, as well as all kinds of edged tools, hammers, &c. The plant displaced by the new method of driving consisted of one 100-h.p., 40-r.p.m. beam engine, with a Lancashire boiler, and three gas engines. These were replaced by 11 motors, varying in capacity between 3½ and 45 h.p., all running at 710 r.p.m., together with the necessary cables, switchboard, &c. Two further gas engines and two steam engines are still in use for the present.

The supply is obtained from both the Bordesley and Saltley sub-stations of the Birmingham Corporation Electric Supply Department, and is fed into the works at 5,000 volts, three-phase, 25 cycles, through three-core, paper-insulated, lead-covered cables, laid underground in earthenware troughs, to a high-tension, three-panel, iron-clad switchboard in the works sub-station, covering the small space of 15 ft. by 12 ft., and shut off by expanded metal screens. The switchboard is of the standard type used by the Birmingham Corporation Electric Supply Department, the outside panels being connected to the incoming feeders and the central one to the customers' circuits, arrangements being made for running off either supply. On each of the incoming feeder panels are two potential indicators and an oil switch. On the outgoing panel are fitted an ammeter, two potential indicators, a wattmeter, and an oil switch. From this panel the supply is taken by three single-core, rubber-insulated, lead-covered cables to the main oil-switch, mounted in a stone cubicle, from which it is led by three single, rubber-insulated cables to a 200-k.v.a., 5,000/440-volt, oil-cooled transformer, and then by three rubber-insulated, single-wire armoured cables supported on porcelain insulators to the low-tension panel containing ammeter, voltmeter, and porcelain fuses for each of the five outgoing circuits which are fed to the distribution boxes in different parts of the works.

In one of the tool shops is a battery of 4- to 7-cwt. stamps, which is driven by a 45-h.p. motor belted to line shafting along the top of the stamps. A band is attached to the weight (*i.e.*, to the top half of the die), passes over a pulley, and is joined to a rope of sufficient length to allow the man operating the stamp to catch hold easily. By pulling the rope the friction between the band and the pulley lifts the weight, and the rope being released the weight falls on the heated metal. This operation is repeated a number of times, depending on the weight of the top die, and the distance it falls. The furnace fires used for heating the metal before it is taken to the stamps are blown by a 10-h.p. motor-driven fan, and a second 45-h.p. motor drives a further group of three stamps, the furnaces in connection with which are blown by a fan driven by a 7½-h.p. motor. A motor of 20 h.p. is mounted on the framework of another set of stamps, which it drives through belting. A fly-wheel is placed on the countershaft in a portion of the space which formerly contained the displaced large boiler. There is also a 24 h.p. motor driving two large American board stamps, and two power presses.

From the stamps the forgings are taken to the emery wheels driven by a 7½-h.p. motor. The edged and other tools are taken to the grinding mill, containing six large wet running stones driven by a 15-h.p. motor. The 7½-h.p. motor which drives the emery wheels also drives the exhaust fan used to carry the dust from the wheels to the dust settling tanks. The shop in which the polishing of the tools is carried out is operated by a 10-h.p. motor, mounted on the ceiling. This motor drives seven polishing machines, the exhaust fans used in connection with these being operated by a 4-h.p. motor. The handles for the different tools, such as hammers, &c., are made on the premises in the wood-working department, which is sectionised and is driven by two 5-h.p. motors. The whole of the electrification of these works has been carried out by the British Westinghouse Electric & Manufacturing Co., Ltd., to whom we are indebted for the above particulars.

Joint Conference of London Electric Supply Authorities.—The Joint Conference of London Electric Supply Authorities held a meeting at Cannon Street Hotel on Thursday last. Mr. E. Debenham was in the chair, in the absence, through illness, of Mr. W. F. Fladgate. An interim report of the Executive Committee of the Conference was submitted, approved, and adopted. This dealt with the extensive work which has been carried out during the past year by the Executive Committee, assisted by the Joint Engineers' Committee in setting out the bases of a linking-up scheme under the London Electric Supply Act, 1908. Reference was made to the valuable information of a confidential character which had been collated by the Joint Engineers' Committee, bearing on the question of supply of London, and upon which the Engineers are still engaged. The Executive Committee were unanimously reappointed. A resolution was passed expressing appreciation of the work of the Electric Supply Publicity Committee, and it was unanimously decided that the members of the Conference should subscribe a substantial amount to the funds of the Publicity Committee, on a revenue basis, for the purpose of their developing a still more vigorous advertising programme.

CORRESPONDENCE

THE ELECTRICAL TRADES BENEVOLENT INSTITUTION.

To the Editor of Electrical Engineering.

Sir,—About this time of the year it is not uncommon to make subscriptions and give donations to charitable objects, and I therefore venture again to remind you of the existence of the Electrical Trades' Benevolent Institution, and to beg you to bring it to the notice of your readers, many of whom on previous occasions have taken note in a very effective manner of the kindly reminders you have given them. Thanking you in anticipation, I am, yours truly,

Ridler Place, Holland Street, Blackfriars, S.E., Dec. 5th, 1910. W. Davenport, *Secretary*.

STARTING OF INDUCTION MOTORS.

To the Editor of Electrical Engineering.

Sir,—In reply to the query by "A. C." in your last issue, I have not actually had any occasion to fit an overload device in the manner shown in my sketch to an induction motor having slip-rings on the rotor. In such cases the starting current does not obtain the same proportions as is the case with squirrel-cage machines, and it is therefore not usually necessary to cut out the overload device during the starting periods. But I do not think there would be any difficulty in meeting such a case as your correspondent raises, and if he is an engineer it would not take him many minutes to scheme out something suitable. One way that readily suggests itself is to connect the ends of the overload-coil in the stator circuit to a pair of terminals on the rotor rheostat. During starting-up periods these terminals could be short-circuited by means of a link which is lifted by the rheostat arm when in the full "on" position. The overload coil in the stator circuit would by this means be short-circuited during such times as the motor was taking a heavy starting current. There are no doubt other ways of accomplishing the object in view which would readily suggest themselves to anyone having such a problem to solve.

Yours faithfully,

4 Queen Street Place, E.C., Dec. 5, 1910. Frank Broadbent.

To the Editor of Electrical Engineering.

Sir,—I have read with interest the correspondence in your columns *re* the above, and would like to point out that the method of protection as submitted by Mr. Frank Broadbent, for rheostatic type starters, has been used in a simplified form on A.C. double automatic starters, designed and manufactured by Mr. George Ellison, for the past three years. These starters control the stator as well as the rotor circuit, and where the motor is not fitted with short-circuiting and brush-lifting device, the overload coil is put in the rotor circuit and connected to the resistance and the last contact. Where it is necessary to have the overload coil in the stator circuit, similar protection is given by splitting the stator contact and connecting to the coil. As these starters are fitted with a spring, it is impossible to leave the arm in any intermediate position.

Yours faithfully,

Birmingham, Dec. 6th, 1910. D. G. Robertson.

BOILER CLEANING APPARATUS

A DEMONSTRATION was given on Friday afternoon last at the Hotel Metropole, London, of a new device for removing scale from the interior of boilers. The apparatus has been devised by Mr. A. Schror, and is being introduced by the Electric Safety Boiler Cleaner, Ltd. (6 Lloyd's Avenue, Fenchurch Street, E.C.). It consists of three steel discs, similar in appearance to milling cutters, with the teeth staggered relatively to one another and keyed side by side on to a spindle mounted in a holder which can be conveniently held in the hand. The cutters are driven at a comparatively high speed by means of a flexible shaft from a ½-h.p. electric motor. When held against the scale the rapid succession of blows by the chisel points of the cutters scrapes away the scale. It is claimed that no damage is done when the cutters reach the steel, as the pressure on the tool is not sufficient. The tool is so small as to enable corners and narrow parts to be got at, and it is stated that it is possible to clean any type of boiler in from three to five days. For water-tube boilers, a different form of tool is used, but this was not exhibited. It was stated, however, that a rotary cutter on the end of a flexible shaft is introduced into the tubes *in situ*, and can be used conveniently whatever the shape of the tubes.

SCIENCE AND ENGINEERING

THE presidential address which Sir J. J. Thomson delivered to the Junior Institution of Engineers on November 15th was entitled "The Influence of Pure Science in Engineering." The distinction, he said, between pure science and engineering was one, not of method, but of aim. The physicist endeavoured to discover new facts without any thought as to their utility, but it was a striking feature in the history of science that almost every advance in pure physics had been turned to account by the engineer, the manufacturer, or the doctor. The province of applied science, of engineering, was to survey the facts known to science, and to select those which seem to have in them the possibilities of industrial application. This development, he thought, could generally best be done in laboratories or research workshops attached to works. Here there were opportunities of testing results on a commercial scale, and that technical knowledge of detail which often means the difference between success and failure, and here, too, were probably available greater supplies of money and greater incentives to success than are at the disposal of Government, municipal, or university bodies. The success of works' laboratories in Germany and the United States, and to a growing extent in this country, was one of the most striking features in modern industrial development. He thought that a closer connection with science would be of great service to engineering and commerce in this country. Practice, however, sometimes outstripped theory, and progress had to be made by trying one thing after another. There were, for example, many phenomena in wireless telegraphy which had not yet received any adequate explanation. It was the object of applied science to keep theory and practice at the same level, by raising the one underneath, not by pulling down the other.

It appeared to him that faith in the results of pure science was more robust in Germany and the United States than in this country. Here we cultivated more exclusively things which ripened quickly and yielded an immediate return upon the capital invested, and were inclined to turn aside from projects which, though more profitable in the long run, would take a long time before they came into bearing.

It was not that we had lacked pioneers in this country, but it could not be maintained that science played as large a part in engineering and industry on a whole here as it did in Germany. One reason for the comparative neglect of pure science in engineering was that the training in that subject given in our engineering and technical colleges was not that best adapted to develop any great interest or enthusiasm for it. Economy of time was so important that attention was paid only to those parts of science which had direct application to practice. The results are especially conspicuous in mathematics. The language of mathematics, he said, should be as familiar to the engineer as his mother tongue; his mathematics should be as a part of himself, and he should be able to use them with the confidence with which a good workman uses his tools. It might be urged that the curriculum for engineering students was already so overloaded that it was impossible to find time for a fuller study of science and mathematics. That was only true because that curriculum was founded on the truly British idea that boys are not expected to learn anything at school. Most of the work in the courses for students in their first year, and some of that in the second, in all engineering schools was of a kind that a boy might well be expected to have done at school. Though he regretted the predominance of classics in our public schools, he would regret still more any system which allowed boys to restrict their studies entirely to scientific subjects, in fact, to any system which involved premature specialisation. The education of the engineer ought to be framed so as to develop those qualities which make him, in the best sense of the word, a man of the world. These were much more likely to develop by a training which included a considerable study of literature than one which was severely restricted to scientific or technical subjects.

ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to the Editor, Electrical Engineering, *205–6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.*

J. D.—Send us the details of your particular case. To answer your question in general terms would fill a book.

W. M. Ferber.—Application for membership of the Institution of Electrical Engineers, London, should be made to the Secretary, Mr. P. F. Rowell, at the offices of the Institution, Victoria Embankment, W.C., from whom can be obtained the qualifications necessary for the various classes of membership.

Digitized by Google

LOCAL NOTES

Axminster: *Electric Lighting.*—A company is being promoted to carry out an electric lighting scheme for the town.

Brazil: *Electric Railways.*—A British Consular report states that the Victoria-Minas Railway, which has a length of 312½ miles, is to be converted to electric traction.

Bristol: *New Offices.*—The Engineer's Offices at Temple Back and the showrooms in Colston Street have been removed to The Exchange, Corn Street.

Canada: *Electric Traction.*—The *Board of Trade Journal,* quoting from the *Canadian Gazette,* states that applications are being made for the incorporation of the Pacific & Peace Railway Co. and Saskatoon & Hudson Bay Railway Co., both of which propose to construct electric railways.

Dawlish: *Overhead Wires.*—Mr. A. P. Trotter, Electrical Adviser to the Board of Trade, held an inquiry last week respecting an application by the Dawlish Electric Supply Co., Ltd., for permission to erect overhead wires in connection with the power station which they are constructing in Brook Street. A number of objections were made by individual ratepayers, mainly on the ground of disfigurement of the town. Mr. Trotter stated that the Board of Trade had to consider the protection of the public and not the appearance of the place. There was no opposition by the Town Council, whose surveyor has to approve the position of the wires, and Mr. Trotter will report in due course.

Dundee: *Tramway Extensions.*—Mr. Peter Fisher, the Tramway Manager, is reporting upon some extensions of the tramways.

Gloucester: *Generator Foundations.*—Rubber foundations are to be fitted to one of the generating sets in order to avoid the vibration which at present exists. The foundations to be fitted are a patent of M. Prache, who has offered to fit them free of charge.

India: *Bulk Supply.*—The Tata Hydro Electric Power Supply Co., which proposes to supply electrical energy in bulk in the Bombay district, has now been registered. Preliminary work has been commenced.

Leeds: *Electric Lighting Accounts.*—We regret that in a short note dealing with the Leeds accounts last week, we stated that the loss of £8,980 was for the past year. It should have been stated that this figure relates to the half-year to Sept. 30th. The accounts for the last completed year, that is, to March 31st, 1910, showed a surplus of £8,931, although the accounts for the first half of that year showed a deficit of £12,322.

London: *County Council: Supply of Coal.*—Owing to the large quantity of coal consumed by the different departments of the London County Council and the difficulties of thoroughly testing the samples, the Stores and Contracts Committee recommend the appointment of a coal officer, who shall have passed the Home Office examination for colliery managers, to buy direct from collieries in future. This officer will give assistance in testing various samples, but the chief officer of the tramways will still remain responsible for the coal for the Greenwich power house, and will be able to call upon the coal officer for assistance.

Islington: Street Lighting.—The Borough Council have decided to put up 16 additional arc lamps, which will displace 40 gas lamps, and result in a saving of £34 10s. per annum in the lighting bill. At the last meeting of the Council this question was discussed, and Alderman Vorley, the Chairman of the Electricity Committee, stated that electricity for public lighting in Islington was five times cheaper than gas, candle-power for candle-power. He added that there is no intention on the part of the Lighting Committee to go back to gas.

Liverpool Road: Tramways.—The proposal of the London County Council not to reconstruct the Liverpool Road horse tramways for electric traction, but to abandon the lines altogether, has been referred back to the Highways Committee for further consideration.

Mexico: *Water Power Utilisation.*—It is stated that an electric power scheme is about to be developed on the west coast of Mexico, which involves the erection of three power plants on the Mayo, Humaya, and Santiago Rivers, at an estimated cost of over £1,000,000. Some 1,200 miles of transmission lines will be erected, and the area includes about 20 towns with which negotiations are to be opened up for a supply of electrical energy. A large number of horse tramways and steam railways are also within the sphere of the company's operations.

New Zealand: *Water Power Development.*—According to the *Board of Trade Journal,* a Bill has been introduced into the New Zealand Government providing for an expenditure this year of £500,000 in the development by State enterprise of the chief sources of water power in New Zealand. In connection with this proposal it is proposed to electrify the railway through the Lyttleton-Christchurch tunnel.

Pickering: *Provisional Order Revoked.*—The Board of Trade have revoked the Pickering Electric Lighting Order granted in 1901.

Spain: *Electrical Imports.*—The imports of dynamos and motors into Spain for the year 1909 only amounted to 9,000 kilos, compared with 37,000 kilos in 1908. The decline is attributed to the great strides made in the electrical industry in the province of Barcelona.

Sweden: *Water Power.*—According to the *Board of Trade Journal* a measure is to be submitted to the Riksdag for sufficient funds to make a complete survey of all the waterfalls in Sweden, with a view to considering the best method of exploiting them.

Transvaal: *Storage Battery Tramcars.*—According to the *British and South African Export Gazette,* Krugersdorp, in the Transvaal, is to be provided with a tramway system, with cars of the Edison-Beach storage-battery type. (See Electrical Engineering, May 19th, p. 319.)

Winchester: *Purchase of Electric Light Co.*—Arbitration as to the purchase of the Winchester Electric Light Co.'s undertaking has been avoided, the Council and the Company having come to terms as to the price to be paid. The terms agreed upon have not yet been made public.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—The Sydney Deputy Postmaster-General requires a testing equipment, consisting of a rotary converter, transformer, switchboard, &c., to work at 240 volts D.C. Tenders by Feb. 1st. Tender forms, &c., at 72 Victoria Street, London, S.W.

Canada.—The Calgary City Commissioners require a 1,500-h.p. synchronous motor generator, exciter set, switchboard, instruments, &c. Tenders by Dec. 22nd. Copies of specifications may be seen at 73 Basinghall Street, London, E.C.

Carnarvon.—A loan of £1,911 is to be taken up for electric lighting extensions.

Chili.—The *Board of Trade Journal* announces that a concession has been granted to Messrs. Rafael Ovalle and Gilbert Hodgkinson for installing electric light in the town of Rancagua.

Haslingden.—An expenditure of £5,000 is contemplated in connection with the distribution of electricity which the Accrington Council is supplying in bulk. Mr. J. S. Watson, Electrical Engineer to the Bury Corporation, is advising the Council.

London: *Stepney.*—A loan of £10,000 is to be taken up for additional plant at the Limehouse generating station.

Loughborough.—Additional 200 kw. of generating plant is to be installed.

New Zealand.—The Thames Council are considering a scheme of electric lighting and tramways.

Paraguay.—The *Review of the River Plate* states that three applications have been made for a concession for electric lighting and tramways in Asuncion, and that a "battle royal" is raging in connection with the matter. The applicants are Mr. Carosio, of Buenos Aires, Mr. Manues Rodriguez, chairman of the Central Paraguay Railway Co., and Mr. Muller.

Roumania.—According to the *Board of Trade Journal,* the municipal authorities of Botoschan invite tenders by Dec. 31st for an electric lighting installation. Particulars from Herr Bürgermeister, Bürgermeisteramt, Botoschan.

Todmorden.—Extensions of cables are contemplated.

Digitized by Google

Transvaal.—A scheme for the electrification of Henderson's Transvaal Estates, Ltd., is in hand, a licence for the erection of a power station having been obtained from the South African Government.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Accommodation for mentally defective children in various parts of London. L.C.C. Education Committee.

Adaptation of Alexander Institute, Carter Street, Walworth, as Cinematograph Hall.

Alterations to electric lighting installation at Deptford Public Baths, Laurie Grove, New Cross.

Electrical installation at Skating Rink, Brook Green Road, Hammersmith.

Alterations to electrical installation at Wesleyan Central Hall, High Street, Plumstead.

New school in North St. Pancras.

PROVINCES.

Aberdeen.—Extension of Ferryhill School.

Amble.—Extensions at the Gibson Street Schools.

Bockenham.—Proposed enlargement of Workhouse.

Belfast.—Shops and warehouse in Castle Street. Architect, Mr. A. Seaver, 16 Donegall Square South.

Birmingham.—Public baths in King's Norton.

Bournemouth.—Sessions House, Police Court, and Police Station.

Canterbury.—New schools.

Carnarvon.—Completion of Institute buildings.

Doncaster.—New Postal Sorting Office. Builders, Messrs. D. Gill & Sons, Doncaster.

Palace of Varieties in Silson Street.

Dundee.—Electric Theatre. J. Bannister Howard, 112 Nethergate.

Edinburgh.—Additions to Small-pox Hospital.

Gateshead.—New Lunatic Asylum.

Glasgow.—Additions to Ruchill Hospital and Belvedere Hospital. Conversion of workshop, 61 St. George's Road, to theatre.

Grimsby.—Extensions to Free Library, Victoria Street.

Hamilton.—Elementary school in Hope Street.

Hebden Bridge.—Proposed sanatorium.

Lancaster.—St. John's Church, Great Harwood. Architects, Austin & Paley.

Limerick.—Tenders are invited for the wiring and fitting of electric lighting, internal bells, and telephones at the Technical Schools, Military Road. Architect, W. P. Ryan. Particulars from the Secretary or Mr. J. Mackey, 58 Dame Street, Dublin.

Manchester.—New church in Winton, Patricroft.

Morecambe.—Ballroom, Theatre, and Music Hall. Morecambe Tower Co.

Reading.—Additions to Workhouse.

Retford.—New girls' school. Notts Education Committee.

St. Albans.—Infectious Diseases Hospital. Joint Hospitals' Committee.

Southampton.—New buildings for Hartley College.

Wolverhampton.—Eight dwelling houses, Bruford Road. L. Clarke, Norfolk Road.—Four dwelling houses, Bruford Road. Miss N. Shaw.

MISCELLANEOUS

Argentine.—Surveying operations are to be carried out with a view to the establishment of a national system of telephonic communication.

Negotiations are being carried on between the Rosario City Council and the Rosario Electric Tramways Co. for extensions of their system. The company, whose concession is for 55 years, have now asked, says the *Review of the River Plate*, for a further extension of 25 years as a condition of carrying out extensions. On the other hand, the Council suggest a uniform tariff of 10 cents.

Beckenham.—A special report is being prepared in connection with improved lighting in the Anerley, Beckenham, and Croydon Roads.

Bournemouth.—Tenders are invited by Dec. 22nd for the construction of 1¼ miles of tramways on the overhead trolley system.

Eccles.—A loan of £1,000 is to be applied for, for the purchase of motors for hire.

Egypt.—A proposal to reconstruct the Egyptian State Railways for electric traction, and to use the outflow of the Assouan reservoir for generating electrical energy, is under consideration.

London: *County Council.*—The Highways Committee recommend the reconstruction to electric traction of the horse tramways running from Finsbury Park *via* Southgate Road to the City Road, at an estimated cost of £123,880.

Spain.—The Compania del Tranvia Urbano del Bilbao has applied for a concession for the construction of a number of electric tramway lines.

War Office.—Tenders for various stores are required, including cables, electrical stores, and scientific instruments. Director of Army Contracts, War Office, London.

TENDERS RECEIVED AND ACCEPTED

Birmingham.—The tender of Messrs. W. Griffiths & Co. has been accepted for relaying certain tramway tracks.

Bolton.—The tender of the British Insulated & Helsby Cables, Ltd., has been accepted for the supply of cables for 12 months.

Brighton.—A tender of Messrs. Chamberlain and Hookham to supply meters for the tramcars at £3 5s. each has been accepted. The contractors have agreed that if after six months a saving of at least 5 per cent. in current consumption is not shown, the meters are to be taken back and the money refunded.

The tender of the Stanton Iron Works Co., of Nottingham, has been accepted at £1,145 10s. for the piping arrangements in connection with the new water-circulating system at the Southwick Electricity Works.

Croydon.—The tender of Messrs. Ferranti, Ltd., has been accepted for a supply of meters.

Dundee.—The supply of cables for the Electricity Department's requirements during the next year, for which the committee recommended placing an order with the Union Cable Co. at last meeting, has been remitted back for further consideration by Council, there being a general opinion that the work ought not to go to a foreign company on such a small difference in price, especially as British manufacturers are handicapped by having to work under a special trades' union clause.

Messrs. Siemens Bros. Dynamo Works, Ltd., have, we are informed, obtained the largest contract for metal filament lamps for ship lighting which has ever been placed. The order comes from one of the largest shipbuilders in the United Kingdom.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 5s. to £59 10s. per ton (last week, £59 to £59 10s.).

Dissolution of Partnership.—F. Simpkin and C. Gibson, electrical engineers, 66 Kirkstall Road, Leeds, have dissolved partnership. Debts all to F. Simpkin.

Liquidations.—The Chichester & District Electric Supply Co., Ltd., is to be wound up voluntarily. Mr. H. A. Stagg is liquidator, and a meeting of creditors will be held tomorrow, Friday, at 1 Kingsway, London, W.C.

Concert.—The staff and fire brigade of Messrs. Siemens Brothers Dynamo Works, Ltd., Incandescent Lamp and Fittings Department, Tyssen Street, Dalston, held their annual supper and concert at the "Crown and Castle" Hotel, Dalston, on Friday last, Mr. J. S. Huddleston in the chair. An excellent variety programme was provided by kind permission of Mr. W. Gibbons, of the London Theatre of Varieties.

Synchronome Clocks.—The Synchronome Co. inform us that, in addition to the diploma of honour gained at Brussels, their system of electric clocks was used extensively in the Centenary Exhibition at Buenos Aires, and was awarded a gold medal.

Bankruptcy.—C. H. Pearson, electrical and mechanical engineer, 37 Park Street, Greenhays, Manchester, has been adjudicated bankrupt.

Digitized by Google

APPOINTMENTS AND PERSONAL NOTES

Mr. C. M. Davis, of the Tynemouth Electricity Department, has been appointed engineer and canvasser in the Bristol Electricity Department at a salary of £156 per annum, and Mr. T. B. Stoddart, at present with Messrs. Wm. Drysdale & Co., Barrow-in-Furness, and formerly of the Edison & Swan United Electric Light Co., Newcastle-upon-Tyne, has been appointed showroom attendant at Bristol, at a salary of £91 per annum.

An assistant electrical engineer is required for a leading railway company abroad. Salary, about £750 per annum. (See an advertisement on another page.)

Manager wanted for metallic battery lamp department. (See an advertisement on another page.)

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

British Electric Traction Co.—The receipts of the British Electric Traction Co. and its associated concerns, from the commencement of the present year to November 18th, show an increase of £63,900 compared with the corresponding period of 1909.

Blackpool, St. Anne's & Lytham Tramways Co.—The report for the year to October 31st shows a net profit of £8,523 against £6,640 in the previous year. A dividend of 2½ per cent. on account of arrears of debenture interest was recommended. The arrears of debenture interest now amount to £25,625.

Electrical Securities Trust.—The accounts for the year to November 14th show a loss of £4,706. This does not include the book loss on the South Western Traction Co. bonds amounting to £24,507. The accounts take no credit for interest or dividends due during the year, but which have not yet been paid.

Cleveland & Durham Electric Power Co.—A petition for confirming the reduction of the capital of the Cleveland & Durham Electric Power Co., Ltd., from £1,000,000 to £700,000 was heard before Mr. Justice Neville on Tuesday.

Dividends.—Sao Paulo Tramway, Light & Power Co., quarterly dividend of 2½ per cent.

Manx Electric Railway Co.—Dividend on the preference shares, making 5½ per cent. for the year, carrying forward £236.

British Columbia Electric Railway Co.—Dividend at the rate of 8 per cent. per annum on the deferred ordinary stock for the June half year.

Adelaide Electric Supply Co.—At the annual meeting of Monday it was stated that at the end of 1911 the Local Authorities have the option of purchasing the Company's business, and that inquiries are now being made as to the details.

Companies to be Struck Off Register.—The names of the following will be struck off the register of joint stock companies within three months unless cause is shown to the contrary: Accessible Battery & Engineering Co., British Accumulator Co., British Arc Lamps, Crawford Electric Lamp Syndicate, Electrical Mining Co., Electric Loco-Motor Propulsion Co., Farnham & District Electric Supply Co., Gould Storage Battery Co., London & Provincial Illuminated Advertising Column Co., Mercédès Petrol-Electric Co., Nottingham Electrical Co., and Traction Corporation, Mercédès Electric Manufacturing Co., and Traction Batteries, Sir Hiram Maxim Electrical & Engineering Co., and Telescriptor Co.

Siemens-Schuckert Werke Ges., Berlin.—The report for the year ending July, 1910, shows a net profit of approximately £530,000, permitting a 10 per cent. dividend, as in the previous year.

Siemens & Halske A.-G., Berlin.—A 12 per cent. dividend is proposed for the year ending July, 1910. The report shows a net profit of approximately £575,000.

NEW COMPANIES

E. HILDEBRANDT.—44, Croft Street, Lower Road, Deptford. Capital £5,000. Manufacturers of accessories used in electrical and gas industries.

MATTAGAMI RIVER FALLS SYNDICATE.—Registered by Spyer and Sons, 65 London Wall, London, E.C. Capital £1,000. Electric light and power supply.

INTERNATIONAL RAILOPHONES, Prudential Buildings, Corporation Street, Birmingham. Capital, £10,000. Telegraph and telephone makers, &c. To adopt agreements with Railophones, Ltd., and H. Von Kramer. Among the subscribers are Andrew Stewart, H. Von Kramer, and T. Duckitt, all electrical engineers.

S. BOTTONE & SON: 93 Manor Road, Wallington, Surrey. Capital £2,00). To take over the business of electrical and mechanical engineers, now carried on by A. E. R. Bottone.

BRITISH LIGHTING DEVELOPMENT CO.: 19 Ingate Place, Queen's Road, Battersea, London, S.W. Capital £1,250 (1,000 deferred shares of 1s. each). Manufacturers of electrical and other fittings, &c., and to acquire the business of the British Lighting Development Co.

ENGLISH ELECTRICAL CO.—Registered by Jordan & Sons, 116 Chancery Lane, London. Capital, £5,000. Electrical engineers and contractors

AURIPHONES.—Byron House, Fleet Street, London. Capital, £1,000. Suppliers of auriphones and other telephonic and electric apparatus.

ACCESSORIES MANUFACTURING CO.—11 Dean Street, Oxford Street, London. Capital, £5,000. Dealers in electrical accessories and electrical goods.

GLANTAWE ELECTRICAL SUPPLY CO.—Registered by Alfred H. Atkins, 27 Fetter Lane, London. Capital, £1,000 in £10 shares. To supply electricity in Glantawe, Ystradgynlais, Brecon, or elsewhere in Wales.

SALFORD ELECTRICAL INSTRUMENTS.—67 Queen Victoria Street, London. Capital, £20,000 (10,000 preference shares). To carry on the business of manufacturers of, and dealers in, electrical measuring instruments, meters, wires, cables, and other apparatus, formerly carried on by the General Electric Co., Ltd., 71 Queen Victoria Street, London, and Bow Street Works, Adelphi, Salford. The subscribers are J. Y. Fletcher and T. J. Boorne, Electrical Engineers, 71 Queen Victoria Street, London. The first directors are M. Railing and F. Sells.

CONSUMERS' AND ASSESSEES' PROTECTION SOCIETY.—12 New Court, Carey Street, London. Limited by guarantee. Twenty members each liable for £1 in the event of winding-up. To protect the interests of householders and others in regard to the consumption of electricity, gas, water, &c., or the assessment in payment of rates.

ELECTRIC WATER HEATERS: 16B St. Vincent Street, Glasgow. Capital £2,000. Makers of heating apparatus, &c.

SANDWICH, DEAL & WALMER ELECTRICITY SUPPLY CO.—Registered by Mowll & Mowll, Howard House, Arundel Street, Strand, London. Capital £4,000. To supply electricity in Sandwich, Deal, Walmer, Eastry, Dover, and elsewhere.

ELECTRIC SAFETY BOILER CLEANER.—Registered by Marlow & Patey, 8 Regent Street Pall Mall, London. Capital £25,000 in 20,000 7 per cent. participating preference shares of £1 each, and 100,000 deferred shares of 1s. each.

M. CLARK & CO., Dashwood House, New Broad Street, London, E.C. Capital, £20,000. Electric light, railway, and tramway contractors.

BRITANNIA IMPORT CO., 87 Tabernacle Street, London, E.C. Capital, £500. To acquire the business of electricians, &c., carried on by F. Frohwein.

ELECTRIC TRAIN LIGHTING SYNDICATE.—Registered by Jordan & Sons, Ltd., 116 Chancery Lane, London. Capital, £5,200. To acquire certain patents relating to the lighting by electricity of trains, tramcars, &c.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Theoretische und experimentelle Untersuchungen an der Synchronen Einphasen-Maschine." By Dr. Max Wengner. (München: R. Oldenbourg.) 2s. 6d.; by post in U.K., 2s. 10d.; abroad, 3s.

"Electric Railways," by J. R. Cravath and H. C. Trow. (American School of Correspondence of Chicago.) (London: Crosby, Lockwood & Son.) 4s. 6d. net. By post in U.K., 4s. 10d.; abroad, 5s.

"The Principles of Electric Wave Telegraphy and Telephony." By Prof. J. A. Fleming. 2nd edition. (London: Longmans, Green and Co.) 28s. net. By post in U.K., 28s. 6d.; British Colonies, 29s. 8d.

SUMMARY

THE first of our special Literary Supplements is included in this issue, and contains a list of new publications, reviews of sixteen works on electrical engineering and allied subjects, and a carefully compiled selected list of recommended technical books which we hope will prove of use to those desiring to acquire the best works in every branch of Electrical Engineering.

THE action by Marconi's Wireless Telegraph Co. against the British Radio Telegraph & Telephone Co. for alleged infringement of three of their fundamental patents is now being heard. Each patent will be dealt with separately. Counsel for the Marconi Co. contended that the first patent covered the use of two oscillatory circuits tuned to one another and inductively coupled by means of a transformer. The defendants' arrangement was identical, except that an autotransformer was employed in place of the double-winding transformer described in the Marconi patent. (Page 791.)

PROF. E. W. MARCHANT, in a Paper read last week before the Illuminating Engineering Society, outlined recent improvements in electric lighting more especially as regards metal filament and flame arc lamps. An interesting note on the blackening of tungsten lamps was contributed to the discussion by Prof. G. W. O. Howe. (Page 792.)

SIR R. H. HADFIELD and Prof. B. Hopkinson read a Paper at last Thursday's meeting of the Institution of Electrical Engineers describing a series of researches on the magnetic qualities of iron and its alloys in intense fields. At high inductions many complications in the effects disappear, and the authors were able to deduce a simple relation between the particular aspect of the magnetic properties which they investigated and the composition of the alloy. (Page 793.)

AN illustrated article deals with some recent designs of motor control gear. (Page 794.)

A DISCUSSION took place on Wednesday last week, under the auspices of the Committee for the Protection of Electrical Interests, on the question of electric wiring powers under the Electric Lighting Acts. Unfortunately, the meeting clashed with the sittings of the Conference now taking place between the Incorporated Municipal Electrical Association and the Electrical Contractors' Association, and for this reason was not largely attended. Nevertheless, representatives of the various sides of the electrical industry spoke, and the majority of speakers were of opinion that both municipalities and companies should have powers to invest capital in wiring, but that the carrying out of these should be placed in the hands of those specialising in wiring work. Mr. Gripper is to send Mr. Harland Bowden a list of those towns supplied by Edmundson companies in which there are no local contractors. (Page 795.)

THE Highways Committee of the L.C.C. recommend that proceedings be taken against the Marylebone and Islington Councils for failing to comply with requirements regarding electricity testing stations. (Page 795.)

AMONG the specifications published by the Patent Office on Thursday was one by A.-G. Brown, Boveri & Cie for non-rusting steam turbine blades of an alloy of pure iron and nickel. A wall-plug which cannot be removed by a direct pull is covered by A. Bonella. There have been no objections to the extension of the original Lodge patent for syntonised wireless telegraphy. The opposition to the grant of patents to C. Steinweg for a solder for aluminium, and to R. Jahoda for a process of manufacturing metal filaments, has been unsuccessful. A patent by G. Ellison for a dash-pot time-lag device for circuit-breakers is opposed. Application has been made for the revocation of a patent relating to mechanical under-feed stokers. (Page 796.)

A CORRESPONDENT sends us particulars of an emergency installation of an electric motor to replace a broken down gas engine. (Page 797.)

Digitized by Google

THE London County Council disagree with the Borough Councils that it is necessary to frame regulations for ventilation of telephone street boxes.—The Manchester Corporation have been ordered to pass a bye-law fixing a definite distance between their tramcars.—Scarborough Corporation have been asked to bear the loss on the Tramway Co.'s service in the winter.—The Board of Trade have granted a further two months in which the Dolter system at Torquay is to be removed.—The Board of Trade have refused sanction to the Oldham Corporation for the supply in some outside districts. (Page 798.)

Two 750 kw. sub-station units are required by the New South Wales Government, and mains at Bedford, Fareham, Hackney, and Maidstone. Bradford propose to spend £60,000; Ealing, £20,000; Eastbourne, £8,000, and Hammersmith £60,000 for electrical extensions. A 1,000 kw. generating set is required at East Ham; high- and low-tension switchgear by the London County Council; and a 600 kw. mixed pressure turbine set by the Leyton Council. Meters are to be placed on the tramcars at Darwen. (Page 798.)-

Borough Polytechnic Institute.—The distribution of prizes and certificates by the Earl of Lytton will take place at the Institute, Borough Road, S.E., on Monday, December 19th, at 8 p.m.

Free Wiring at Canterbury.—In our issue of July 7th, 1910, last, we reported a judgment in the Canterbury County Court in respect of free wiring. Some years ago the National Electric Construction Co., Ltd. (then the National Free Wiring Co.) entered into an agreement for the free wiring of premises, the Corporation to pay them 1d. per unit upon all energy consumed in the premises so wired. The Company sued the Corporation for £25 13s. 9d. in respect of particular premises, the present occupier of which is not the person who agreed to the installation to be put in, and who refused to pay the extra 1d. per unit to the Corporation. The County Court judge held that as the Corporation were not empowered under the Electric Lighting Acts to undertake the wiring and fitting of premises, they could not be forced to pay the Company, as their agreement was illegal. The Company entered an appeal against this decision, but when the action was reached in the Divisional Court in London last week, it was announced that the appeal had been abandoned.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, DECEMBER 15TH.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. "Submarine Cables for Long-Distance Telephone Circuits," by Major W. A. J. O'Meara.

FRIDAY, DECEMBER 16TH.

Electro Harmonic Society.

8 p.m. Smoking Concert, at Holborn Restaurant.

SATURDAY, DECEMBER 17TH.

Junior Institution of Engineers.

3 p.m. Visit to G.P.O. Power Station, Blackfriars.

L.C.C. School of Engineering.

3.30 p.m. At Poplar. "Electric Waves," by E. A. Martin.

Association of Mining Electrical Engineers.

6.30 p.m. Lancashire Branch. At Grand Hotel, Manchester. Address by the President, Mr. W. Maurice.

MONDAY, DECEMBER 19TH.

Institution of Electrical Engineers: Newcastle Section.

8 p.m. At Armstrong College. Discussion on "Switchgear and the Isolation of Faults on Power Systems," to be opened by H. W. Clothier.

TUESDAY, December 20TH.

Physical Society.

3 p.m. to 10 p.m. Sixth Annual Exhibition at Imperial College of Science. Experimental discourse on Detectors by Dr. J. A. Fleming.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At University. "Merz-Price and other Discriminative Protective Apparatus for A.C. Circuits," by K. Faye-Hansen and G. Harlow.

Condensing Plant.—A Paper, entitled "Recent Developments in Condensing Plants," was read recently by Mr. G. L. Kothny, before the Junior Institution of Engineers. The Paper was devoted entirely to the various forms of condensing plant which have been designed to take advantage of the high degree of vacuum obtainable by the use of the Leblanc rotary dry air pump. A number of tests of such plant were given, including some of the multiple-jet Leblanc condensers at the Neasden power-house of the Metropolitan Railway and the L.C.C. power station, Greenwich. A condensing plant of this description was described at some length in ELECTRICAL ENGINEERING, May 19th, p. 321, and some further notes on Westinghouse-Leblanc plants were given on November 17th, p. 733.

The adjourned Conference of representatives of the Incorporated Municipal Electrical Association and the Electrical Contractors' Association, with regard to the question of Municipal Wiring, meets to-day.

(With apologies to Punch Almanack's version of another Important Conference.)

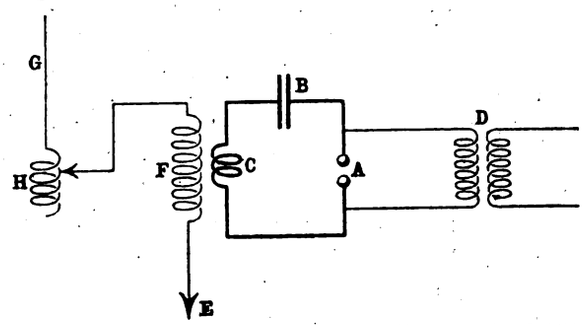
THE WIRELESS TELEGRAPH PATENT CASE

CONSIDERABLE importance is attached to the result of the action now being heard before Mr. Justice Parker in the Chancery Division of the High Court, in which Mr. G. Marconi and Marconi's Wireless Telegraph Co., Ltd., seek to restrain the British Radio-telegraph & Telephone Co., Ltd., from the alleged infringement of their patents Nos. 7,777 of 1900, 10,245 of 1902, and 4,593 of 1907, all granted to G. Marconi and the Company.

The first patent is claimed to cover the use of a closed oscillatory circuit inductively coupled to the aerial circuit by means of a transformer, the periods of oscillation of these circuits being the same or harmonics of each other, and the use of similar receiving circuits tuned to the transmitting circuits. The second patent is for the well-known magnetic receiver, in which the magnetic condition of a band of iron wire, under the influence of a varying magnetic field, is caused to change suddenly owing to the wiping out by the received oscillations of the lagging flux, the changes being detected by means of a telephone connected to a coil surrounding the band. The third patent is for a high-speed toothed-wheel machine for producing discharges at a very high group frequency.



The wireless equipment to which the Marconi Co. take exception is that supplied by the defendant company to the s.s. *Nonsuch*, of Messrs. Bowles Bros., London. While refusing to admit the infringement, the defendant company contend further that the patents in question are invalid, and submit patents by Sir Oliver Lodge, Dr. S. P. Thompson, Nikola Tesla, and others, and also a number of other publications, which in their opinion anticipate Marconi's inventions. Mr. J. Astbury, K.C., Mr. A. J. Walter, K.C., and Mr. J. Hunter Gray appear for the Marconi Co., and Mr. T. Terrell, K.C., and Mr. H. A. Colefax for the defendants. Expert evidence will be given on behalf of the former by Mr. J. Swinburne, F.R.S., Mr. C. Dugald Clerk, F.R.S., and Dr. W. H. Eccles, and for the British Radio-telegraph & Telephone Co. by Dr. S. P. Thompson, F.R.S., Prof. C. B. Boys, F.R.S., and Mr. W. Duddell, F.R.S.

Considerable public interest has been aroused by the fact that in order to demonstrate to the Judge the actual working of their system, the British Radio-telegraph & Telephone Co. have installed a complete wireless station in the Court. A 600-ft. aerial has been stretched from the top of one of the towers of the building to a window of the Court, and messages will be transmitted and received from a considerable distance. Mr. Duddell, also, has arranged several experiments to demonstrate certain points.

On opening the case for the Marconi Co. on Monday, Mr. Astbury stated that, to avoid confusion, he would deal with each patent separately. The witnesses would be called in each case, so that it would be equivalent to three actions. Mr. Astbury commenced with a brief survey of the history of wireless telegraphy, referring to Preece's experiments in telegraphy by magnetic induction, and the early work of Henry, Kelvin, Clerk Maxwell and Hertz in electrical oscillations and electromagnetic waves. He mentioned Sir W. Crookes's production in 1892 of the application of Hertzian waves to telegraphy without wires, and then referred to the use of a filing coherer by Branly and Popoff to detect electromagnetic waves. Continuing, he stated that Mr. Marconi first applied the knowledge of these phenomena to the transmission of signals. In 1895, Marconi managed, by elongating and earthing the aerial, to transmit to a distance of a mile and a half, and in 1896 took out his first patent in this country. The Marconi Co. was registered in 1897, but no rapid development took place until after 1900, the year of the first of the three patents now being contested. In 1901 signals were sent from Poldhu, Cornwall, to Newfoundland, a distance of 1,800 miles; the first Admiralty contract was obtained in the same year; and in 1905 the Post Office accepted telegrams for communication to ships at sea. At the present time every British battleship and a very large number of mercantile vessels were equipped with Marconi apparatus. Recently, communication had been effected between Clifden and South America over a distance of 6,000 miles. The 1896 patent had now expired, but Mr. Marconi had obtained an injunction against the De Forest Wireless Telegraph Co., of America, for infringement of the corresponding American patent.

Returning to the case in question, Mr. Astbury said that he would confine his remarks to the first patent, No. 7,777 of 1900. Hertz's oscillator was, he said, an excellent radiator which gave out practically all its energy in the first swing; Lodge's experiment with the syntonised Leyden jars demonstrated the case of an excellent oscillator which would give persistent oscillations but which was a bad radiator. It was early realised that the strong but highly damped wave emitted by a Hertz oscillator would set an oscillatory circuit of any natural period into vibration, and that the weak but continuous oscillations given out by a "closed" oscillator such as Lodge's would only excite a circuit whose natural period of oscillation was tuned to that of the applied waves. Lodge had stated in his 1894 lecture, which was partly relied upon by the defendants as anticipating Marconi, that good radiation was incompatible with persistence of oscillation, and took out a patent, No. 11,575 of 1897, for a system which struck the mean between these extremes. He modified Hertz's oscillator by placing extra inductance in the circuit to increase the oscillatory effect, and used larger capacities to lessen the radiation. (It will be noticed in the Patent Record on page 796 of this issue, that an application for the extension of the life of this patent will be heard shortly.)

Mr. Marconi, however, continued Mr. Astbury, solved the problem, and produced an oscillator which was a good radiator and at the same time a persistent oscillator. This was the arrangement covered by the 7,777/00 patent, which enabled efficient and selective operation. Referring to Figure 1 of the patent, part of which is reproduced below, Mr. Astbury pointed out that the "closed" circuit comprising the condenser *B*, the inductance *C*, and the spark-

ARRANGEMENT OF CIRCUITS DESCRIBED IN PATENT NO. 7,777 OF 1900.

gap *A* was a persistent oscillator but a bad radiator. By making *C* the primary of a transformer, however, the oscillations in *C* induced corresponding oscillations in the secondary *F*, which was in series with the aerial circuit. This circuit, consisting of an aerial *G* connected through the inductances *H* and *F* to earth or to a capacity, was equivalent to an "open" Hertz oscillator and was a good radiator. Persistent oscillations were thus generated in the "closed" circuit and radiated by the "open" circuit. It was necessary, in order that the aerial circuit should oscillate in response to the influence of the "closed" circuit, that the period of oscillation of these circuits should be the same or harmonics of each other, and the tuning inductance *H* was to effect this. *D* represented the induction coil for exciting the oscillatory circuit. At the receiving end, the coherer would be connected in a "closed" circuit in which oscillations would be produced by transformer action from an "open" aerial circuit, which would easily be set in oscillation by the impinging waves. The patent also covered a method of winding the transformer, but this was comparatively unimportant.

Continuing his opening speech on Tuesday, Mr. Astbury read out portions of a pamphlet published by the British Radio-telegraph & Telephone Co. describing their apparatus on the Balsillie system (*see* ELECTRICAL ENGINEERING, July 21st, 1910, p. 473). This apparatus, he asserted, infringed all the claims of the Marconi patent in question. The diagram of connections published was identical with the above except that, instead of employing two separate windings for the transformer, the aerial circuit was connected in series with one or more turns of the inductance of the "closed" oscillatory circuit, *i.e.*, an auto-transformer is used in place of an ordinary transformer. These, however, were electrically equivalent. The earthing of the "closed" circuit did not affect the oscillations. He would therefore ask his Lordship to say that the defendants infringed.

Mr. Swinburne, examined by Mr. Walter, explained very clearly the nature of electromagnetic waves, and showed how working with a train of weak waves of constant frequency and a tuned receiver was more efficient than working with highly damped waves of large amplitude, and was also the only method of obtaining selectivity.

RECENT PROGRESS IN ELECTRIC LIGHTING

A PAPER with the above title was read by Prof. E. W. Marchant (Liverpool University) at a meeting of the Illuminating Engineering Society last Friday. Dealing with incandescent lamps, the author said that the most recent development in the construction of tungsten lamps was the use of wire-drawn filaments. A drawback to the older tungsten filaments had been their fragility when cold, although they would stand considerable vibration when hot. He thought that the effect of vibration had been greatly exaggerated. Vibration, however, often caused parts of the filament to become short-circuited, which shortened the life of the lamp. Another matter which was said to affect their life was frequent switching on and off. He had experiments in progress on this, and so far as they went it appeared that the effect was not serious. A few curves of candle-powers at different efficiencies, &c., were shown, and it was mentioned that the British Thomson-Houston Co. had found that the effective life of a tungsten lamp was roughly proportional to the 3·65th power of the initial watts per c.p.

Particulars were given of the illumination of a drawing office of 600 sq. ft. area and 12 ft. high by 18 lamps, using 0·8 watt per sq. ft., and giving an illumination of 3·5 candle-feet on the drawing boards. The lamps were uniformly spaced 3 ft. from the ceiling. The total candle-power used was four times that given by the old rule of 16 c.p. per 100 sq. ft. With inverted silvered reflectors, 2·3 candle-feet had been obtained 2 ft. from the floor with a consumption of 0·83 watt per sq. ft. The character of the light from metal filament lamps corresponded to a continuous spectrum, and he thought their efficiency was due solely to the high temperature and not to selective emission. The nearer we could approach to the temperature of the sun (estimated at 6,200° C.), the nearer we should be to a light for perfect colour matching.

With arc lamps, the principal recent developments had been in flame arc lamps for street lighting, in the directions of suitable light distribution and actual efficiency. Vertical carbons appeared better than inclined in the former respect, and curves were shown for Crompton-Blondel lamps 25 ft. from the ground and 140 ft. apart, where the diversity coefficient was only 4. With Jandus lamps, 20 ft. from the ground and 200 ft. apart, a value of 3·5 had been attained. With V carbons, however, the distribution could be improved by dioptric globes. Some results of tests of efficiency taken by the Ulbricht globe method in the author's laboratory were given. The highest figure attained was 4·5 mean hemispherical candle-power per watt for an enclosed flame lamp with a clear globe. The spectrum given by these lamps was a mixture of a line spectrum and a band spectrum.

Passing on to mercury vapour lamps, the Silica and Quartzlite lamps were described. One of the latter had been found when tested to give 1·73 m.h.c.p. per watt. It was a matter for discussion whether the light from these lamps was injurious to the eye. Their great drawback was the remarkable colour effects which they gave. He had tried mixing their light with that from tungsten lamps with some success, but it appeared that about 54 c.p. from the tungsten lamps should be used with every one c.p. from the mercury arc.

DISCUSSION.

After some opening remarks by Prof. Silvanus Thomson, who was in the chair,

Prof. G. W. O. HOWE (Central Technical College) read a short communication on the blackening of tungsten lamps, and described a case where the deposit had left a clear "shadow" of the filament supports in a position indicating that the bombardment of particles had proceeded from the point where the filament was connected to one of the leading-in wires, and where it had broken. That this is not due to an arc after breakage away of the filament was shown by a similar effect having been seen in unbroken lamps. In many cast "shadows" cast by both leading-in points can be distinguished. But, as far as can be ascertained, the negative seems to be the chief source. Chemical analysis shows that the deposit is almost entirely composed of copper, and a certain amount of copper was found in the leading-in wires, so that all pointed to the fact that the blackening proceeded more from the leading-in wires than from the filament.

Mr. A. P. TROTTER thought that the rate of progress in connection with electric lighting was perhaps rather too rapid. He resented metal filament lamps from one point of view, because he had 205 volts in his house, and could not get anything less than a 20-c.p. lamp. In his office he still retained the carbon filament lamp. Metal filament makers, he supposed, snapped their fingers at a 200-volt 8-c.p. lamp, and yet much lower candle-powers were thought quite sufficient in the olden days.

Mr. HAYDN HARRISON said that when mercury vapour lamps were first put upon the market, their efficiency was put at about 10 candles per watt, but the author's tests showed his efficiency to be only 1·76 candles per watt, which was much nearer the figure he himself had obtained. He did not know whether the quartz or silica glass was responsible for cutting down the efficiency. He did not think the Ulbricht globe was likely to be of much commercial use, because it only gave the mean spherical candle-power, which did not assist the illuminating engineer at all. He also wished to know how the author got the mean hemispherical candle-power. If he took the mean hemispherical as double the spherical, it was wrong.

Mr. A. H. SEABROOK (Chief Electrical Engineer, St. Marylebone Corporation) stated that by issuing instructions to his men to switch on the street lamps when cleaning he had effected a considerable saving in their life. He regarded the introduction of the Holophane globe as an advance in electric lighting as big as that of metal filament lamps themselves. He instanced cases which by using these he had been able to cut down the wattage of the lamps by half, and yet obtained practically the same useful illumination.

Mr. H. D. WILKINSON disagreed with the view that uniform illumination in streets was necessary or desirable, as it was obviously essential to have more light at streets corners and crossings.

Mr. JUSTUS ECK (Union Electric Co.) questioned some of the figures of diversity factor. He had made tests with "Excello" lamps, which had showed a diversity factor of 2·5 to 1·0 with dioptric globes. Unless the lamps were set with great care to secure the arc in the correct position, the whole resultant polar curve was different from what it should be. He also objected to the statement that arc lamps would in future be used mainly for street lighting, for inverted arcs were being used to a large extent for works lighting and drawing-office lighting.

Prof. J. T. MORRIS (East London Technical College) had displaced inverted arcs in three drawing offices at his college by metal filament lamps with holophane reflectors, and had been able to cut down the wattage to about two-thirds, whilst the average illumination was about the same. A change in the make of lamp used frequently altered the results obtained, as the light-giving part was not in the same position in respect to the socket in every lamp, and consequently the distribution was totally altered.

Mr. L. GASTER suggested that some form of standardisation of filaments might be adopted by lamp-makers in respect of the size of filament and the position of centre for every voltage.

Mr. WALDRON, speaking as an architect, said that most of the best efforts of electrical engineers in regard to efficient illumination were being wasted by lamps being placed in unscientific surroundings in regard to wall decorations and papers. There was much work to be done in educating the public in this matter.

Mr. W. R. RAWLINGS suggested that the variation in lives of metal filament lamps was due to voltage variations, and he thought station engineers should pay more attention to this.

Prof. MARCHANT, in reply to Mr. Harrison on the question of hemispherical candle-power, said that the Ulbricht globe did not take into account whether the light was emitted all over a sphere or a hemisphere, but it was obvious that if they had the same flux of light over a hemisphere the mean intensity of emission was twice as great as over a sphere, and therefore it followed that the mean hemispherical candle-power would be twice as great as the result obtained for the mean spherical candle-power from the Ulbricht globe.

Dr. SILVANUS THOMPSON, in proposing a vote of thanks to the author, mentioned that he has a magnetite arc lamp in his laboratory which he has been testing, but the reason why it was not likely to be generally adopted here was that the light was thrown first from one side and then to the other. Some researches in America upon the phenomenon mentioned in Prof. Howe's remarks went to show that there was a discharge of positive electricity at the point of fracture.

The Physical Society's Annual Exhibition.—This exhibition, which is to be held at the Imperial College of Science and Technology, South Kensington, on Tuesday, the 20th inst., will be open in both the afternoon (from 3 to 6 p.m.) and in the evening (from 7 to 10 p.m.). Prof. J. A. Fleming, F.R.S., will give a discourse at 4.15, and again at 8 p.m., on "Some Improvements in Transmitters and Receivers for Wireless Telegraphy," and Mr. R. W. Paul will give a number of cinematograph demonstrations of some physical phenomena. Among the firms exhibiting will be the following:—British Radio-Telegraph & Telephone Co., Ltd.; Cambridge Scientific Instrument Co.; A. C. Cossor, Ltd.; H. W. Cox & Co., Ltd.: Crompton & Co., Ltd.; Elliott Bros.; Everett, Edgcumbe, & Co.; J. J. Griffin & Sons; India Rubber, Gutta Percha, & Telegraph Works, Ltd.; Marconi's Wireless Telegraph Co.; Leslie Miller; Muirhead & Co.; Nalder Bros. and Thompson; Negretti & Zambra; Newton & Co.; R. W. Paul; Weston Electrical Instrument Co. Invitations have been given to the Institution of Electrical Engineers, the Faraday Society, the Optical Society, and the Röntgen Society. Admission will be by ticket only, and those desiring to attend the exhibition should apply to the Secretary of the Society to which they belong.

"ELECTRICAL ENGINEERING"
LITERARY SUPPLEMENT

REVIEWS of books in technical newspapers are deprived of some of their value by the fact that they are lost sight of once the number of the journal in which they appear has been read and put aside. Some readers, it is true, take pride in maintaining a large and up-to-date library of books on the subjects which interest them, and make a point of obtaining, immediately on publication, any work likely to add usefully to their store of knowledge. The large majority, however, whose time for study is limited, adopt the system of waiting to send for a treatise on any particular subject until they actually require it for some specific object, and then a difficulty often arises in remembering the title of the book and the name of the author, although they may have taken notice of the review at the time it appeared. To both these classes of reader, our Literary Supplement, which will be published periodically, will be of considerable utility, but more especially to the latter class. By filing the successive issues of the Supplement, and by making use of the list of recommended technical books when he requires it from time to time, the student and engineer will always be able, at a moment's notice, to find the publication he has need of, and, by availing himself of the services of the sales department, which we have established for the convenience of our readers, he will be able to obtain a copy of it without delay. A feature of the Book List at the end of the Supplement is that the dates of publication of the reviews of most of the books published during the last two years are given. We have been fortunate in securing the services of experts in the various subjects as reviewers, and, as we have absolute confidence in their recommendations —and also in the validity of their criticisms—we have no doubt that the Literary Supplement to ELECTRICAL ENGINEERING will be duly appreciated by our readers.

NEW PUBLICATIONS

We shall be pleased to send any of the undermentioned works to addresses in the United Kingdom, at the net prices quoted. The price for sending to the Colonies and abroad is also quoted when there is an increase. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Mechanical World" Electrical Pocket Book for 1911. 330 pp. 6 in. by 4 in. 100 figures. (Manchester: Emmott & Co.) 6d. net; by post, 7½d.

"Practical Telephony." By Bell & Wilson. Fifth edition. 306 pp. 7¼ in. by 4¾ in. 232 figures. (London: S. Rentell & Co.) 3s. 6d. net; by post in the United Kingdom, 3s. 10d.; abroad, 3s. 11d.

"The Distington Multiple Boiler Explosion and other Multiple Boiler Explosions." By E. G. Hiller. 60 pp. 8½ in. by 5½ in. 20 illustrations. (Manchester: Taylor, Garnett, Evans & Co.) 1s.; by post 1s. 2d.

REVIEWS OF BOOKS

The Construction and Working of Internal Combustion Engines. By R. E. Mathot; translated from the French by W. A. Tookey. 554 pp. 9¼ ins. by 5¾ ins. Many illustrations. (London: Constable & Co.) 24s.; abroad, 25s. 3d.

IN adapting M. Mathot's book to the needs of English-speaking people, the translator has somewhat rearranged the work, and has omitted or condensed some of the descriptive matter relating to Continental engines. He has also made some few additions to record recent progress. The book forms a compendium of modern practice in large and moderate-sized gas engine construction of considerable completeness, but views the matter from more than the purely descriptive standpoint by using the examples to illustrate generalised precepts of theory and practice, as revealed by experience. The title of the work leads one to expect perhaps a slightly wider range, but with the exception of brief mention of a few oil engines, including the Diesel and allied patterns, only engines using gaseous fuel are dealt with. The rapidly growing subject of the engine using volatile liquid fuel through a carburettor does not form part of the scheme.

Commencing with a short general introduction, which includes a table of the output of makers of engines over 1,000 h.p., showing the backwardness of this country in that direction, we have a brief discussion of the relative fields of steam and gas power, and some speculations as to the lines on which future development may take place. Here the gas-turbine problem is shortly dealt with, but the majority of opinions quoted are distinctly unfavourable to its early advent. The gas engine is then considered in more detail, and summaries of the principal features of leading American, Belgian, British, and German engines are given. The general characteristics of horizontal engines are noted, and the multi-cylinder vertical engine is called up for review, but the author has few good words to say for it; several types, however, are described. The marine internal combustion engine is then referred to shortly, and here some patterns of eight-cylinder submarine oil engines are illustrated.

Of perhaps more theoretical interest is the comparison between two-cycle and four-cycle engines. The opinions of eminent authorities on both sides are quoted, but the author expresses no partiality. Both, he thinks, have their special spheres. The details of the various two-cycle designs in common use are dealt with first, and another chapter takes up the distinguishing points in a few four-cycle engines presenting features out of the ordinary, but a mistake has evidently been made in including the Vogt engine, as this is described as being on a two-cycle system. The principal operations of ignition, compression, and cooling are then treated, and reference is then made to lubrication, starting apparatus, mean-pressure efficiency, utilisation of waste heat of exhaust, and silencing. All this part is copiously illustrated with examples drawn from current practice. A long chapter on governing and valve gears follows, and the author shows the same strict impartiality between the different systems in use. Matters of mechanical design and general arrangement are dealt with in subsequent chapters on "Details of Construction" and "Moving Parts"; while the remaining part of the book is mainly devoted to engine testing. A useful feature of the work is the carefully classified list of engines with dimensions and other data, together with such results of tests as are available, which forms with some interesting generalisations the last chapter.

Electric Motors. By H. M. Hobart. Second edition. 748 pp. 8¾ by 5¾ ins. 798 figures. (London: Whittaker & Co.) 18s. net; abroad, 19s. 4d.

MOST engineers and designers of electrical machinery are already acquainted with this book, which is recognised as a reliable and exhaustive treatise on the design of electric motors. The first edition appeared in 1904, and since that date considerable progress has been made in the development of motors, particularly in the reduction of weight and cost. The revision for this

Digitized by Google

edition has consisted largely in the replacement of the older designs by examples of modern machines representing the best work of important firms in this country and abroad, and the inclusion of some interesting designs which appeared in the French and German editions of the book. An extensive section on single-phase motors has also been added, and the book has greatly increased in size.

About half the space is devoted to continuous-current motors, some important characteristics of which—namely, high starting torque, ease of speed regulation and high "all-day" efficiency, have been, Mr. Hobart points out, somewhat overlooked by many engineers in their natural desire to distribute by three-phase alternating current.

The author wastes no space with historical matter or elementary theory, but plunges at once into the technical details of design and construction. The subject of commutation is dealt with briefly but clearly, the importance of keeping down the reactance voltage being properly emphasised. Forced commutation or the use of interpoles in normal designs is not favoured by Mr. Hobart, but a special chapter is devoted to interpole motors for variable speed and difficult ratings such as a combination of high speed and large output. The various types of armature windings and their application to specific cases are explained, and considerable space is devoted to the question of slot insulation and the arrangement and mechanical fixing of former-wound coils.

To illustrate the author's methods, four comparative designs for a 35 h.p. shunt motor are worked out in detail and compared, and the adaptation of a given design for different speeds is also illustrated. A large number of examples of modern machines with working drawings and photographs then follow.

In spite of Mr. Hobart's evident preference for the continuous-current motor, he recognises the many advantages of the three-phase induction motor, and discusses thoroughly the conditions most favourable to its use. In his opinion, high speed and low periodicity, or at least one of these, are essential for satisfactory working, the induction motor being even far better adapted to high speeds than is the continuous-current motor. The various methods of starting induction motors are fully described, and some instructive comparisons between induction and continuous-current motors are given. The design of induction motors is treated in a most thorough manner, considerable use being made of the circle diagram. Mr. Hobart gives a formula for the calculation of the dispersion coefficient (a modification of Behrend's formula), but prefers the use of a series of curves which he gives. These are based on a large number of tests, and results obtained from them show an average discrepancy of less than 10 per cent. with the observed values for 71 motors. A special chapter is devoted to the calculation of torque and of the necessary resistance for insertion in the rotor circuit at starting. Some notes on heating and ventilation are followed by a series of fully worked out examples of modern machines and descriptions of variable-speed motors with cascade and pole-changing connections. This section is concluded by a chapter on the design of small motors for manufacture in large quantities, adapted from an article contributed to these columns by the author.

True to his principles, Mr. Hobart is outspoken in his disparagement of the single-phase motor, although a polemical treatment of the subject is somewhat out of place in a designers' text-book such as this. The single-phase motor certainly does not offer advantages over the continuous-current or the three-phase induction motor for ordinary power work, but in view of its extensive and growing application for traction purposes it is evident that those who have had experience with it are satisfied that the inherent disadvantages of the motor itself are outweighed by other advantages of the single-phase system. In spite of his prejudices, however, Mr. Hobart describes fairly clearly the working principles of the different types, and explains the difficulties met with in commutation and the various methods of compensation employed. The commutatorless single-phase induction motor and methods of starting it are explained. and particulars are given of the Heyland motor. The compensated series and repulsion motors as developed for traction purposes are described, but full details of the latest designs are naturally not available. Some interesting curves and particulars of the Deri motor are included, however.

The Principles of Electric Wave Telegraphy and Telephony. By Prof. J. A. Fleming. 2nd edition. 906 pp. $8\frac{3}{4}$ ins. by 6 ins. Seven plates and 465 figures. (London: Longmans, Green & Co.) 28s. net; by post to British Colonies, 29s. 8d.

THAT Professor Fleming has worked hard to keep his book up to date with the very rapid advances which have been made in wireless communication since the first edition appeared in 1906 is clearly shown by its 600 pages having become 900, and by the words "and Telephony" having been added to the title. Not only has much been added to the text, but much has also been rewritten in the light of the deeper insight that we now have into the phenomena involved. A smaller proportion of the book is now historical, and although there are many interesting accounts of actual equipments, the object of the work is rather to deal with the scientific principles underlying the whole subject and the operation of the appliances used, than to give descriptive detail of apparatus.

The book is divided into three main sections. The first deals with the methods by which electrical oscillations may be produced and measured, with an exposition of the general mathematical treatment of the subject, including the theory of damping and resonance. A wealth of experimental results are also collated. The second part, entitled "Electric Waves," pursues the subject further, and treats in its three chapters of the principles of stationary waves on wires, of electromagnetic waves, and of the detection and measurement of electric waves in this last-mentioned chapter, a bewildering number of detectors (or, as the author euphoniously terms them, cymoscopes) are described, which have been proposed, experimented with, and used from time to time. But little is said as to their relative merits, or the particular conditions for which they are each suitable, nor is the distinction made clear between those that have never been more than laboratory toys, those that have seen service but are obsolete, and those that are in regular use at the present time, although a little information in this respect may be gathered from the historical notes and descriptions of installations later in the book. The principles and uses of the author's now well-known cymometer and other wave-measurers are also dealt with in this chapter.

Having thus prepared the way, with a full survey of the production, properties, detection and measurement of electric waves, the third and longest section of the book sees them applied to the transmission of messages. A chapter of some 120 pages gives a historical account of the rise of wireless telegraphy, or, as it is now becoming more usually called, "radiotelegraphy," as a definite branch of electrical engineering. A large portion of this follows out in a most interesting manner the work of Marconi, but due recognition is given to the ideas of those before him and the developments due to various other workers at a later stage, and this to a greater extent than in the previous edition. The chronological sequence is not followed throughout, as for the sake of continuity the work of each investigator is kept in a separate section. The latter part of the chapter forms a valuable bibliography of wireless telegraph patents. The next chapter is entitled, "The Appliances of Electric Wave Telegraphy," and deals successively with various forms of aerials, directive systems, including that of Bellini and Tosi, and the functions of the earth connection. Various dischargers, including the rotating form of Marconi and several for quenched spark systems, are also given attention here.

Turning now more completely to the practical aspects of the subject, we have some general notes on stations and systems, and as examples of actual equipments, descriptions are given of the Post Office station at Bolt Head, and of a typical Marconi ship installation. A few notes are also given on the Clifden Marconi Transatlantic station and the long-distance station at Nauen, on the "Telefunken" system. The Poulsen

From CONSTABLE'S List.

THE CONSTRUCTION AND WORKING OF INTERNAL COMBUSTION ENGINES.
Being a Practical Manual for Gas Engine Designers, Repairers and Users. By R. E. MATHOT. Translated by W. A. TOOKEY. Medium 8vo. With over 350 Illustrations. 24s. net.
Mechanical World:—"A thoroughly satisfactory translation . . . there is no doubt as to the utility of the book, and we have much pleasure in specially commending it to the notice of designers of gas engines, and to students of the subject generally."

THE INTERNAL COMBUSTION ENGINE.
Being a Text-book on Gas, Oil, and Petrol Engines, for the use of Students and Engineers. By H. E. WIMPERIS, M.A., Assoc.M.Inst.C.E., Assoc.M.Inst.E.E. Illustrated. Crown 8vo. 6s. net.

ELECTRICITY.
By H. M. HOBART, B.Sc., M.Inst.C.E. With 43 Tables and 115 Illustrations. Demy 8vo. 208 pages + xix. 6s. net.
Electrical Review:—"Power factor loses its difficulty completely under the author's treatment, and their relationship between resistance, inductance, and impedance is made quite clear."

INDUSTRIAL ELECTRICAL MEASURING INSTRUMENTS.
By KENELM EDGCUMBE, A.M.Inst.C.E., M.I.E.E. 126 Illustrations. Demy 8vo. 8s. net.
Part Contents.—Introductory. Accuracy of Measurement. Constructional Details. Measurement of Resistance. Potentiometer. Galvanometers. Measurement of Current, &c., &c.

DIRECT AND ALTERNATING CURRENT TESTING.
By FREDERICK BEDELL, Ph.D., Professor of Applied Electricity, Cornell University. Assisted by CLARENCE A. PIERCE, Ph.D. Illustrated. Demy 8vo. 8s. net.

CONTINUOUS CURRENT ENGINEERING.
By ALFRED HAY, D.Sc., M.I.E.E. Illustrated. Demy 8vo. 5s. net.
A simple account of the component parts of a continuous-current lighting and power plant, dynamos, motors, secondary cells, measuring instruments, &c.

FOSTER'S ELECTRICAL ENGINEER'S POCKET BOOK.
By HORATIO A. FOSTER, Mem.A.I.E.E., Mem.A.S.M.E. With the Collaboration of Eminent Specialists. A Handbook of Useful Data for Electricians and Electrical Engineers. Fifth Edition, completely Revised and Enlarged. Pocket Size. Leather bound. Over 1,600 pp. Illustrated. 21s. net.
This new edition embraces the vast changes and advances that have occurred in every branch of electrical engineering.

THE THEORY OF ELECTRIC CABLES AND NETWORKS.
By ALEXANDER RUSSELL, M.A., D.Sc. Illustrated. Demy 8vo. 8s. net.
A thoroughly trustworthy work concerning the network of cables connecting the dynamos with the lamps and motors of the consumer.

THE TELEGRAPHIC TRANSMISSION OF PHOTOGRAPHS.
By T. THORNE BAKER. F.C.S., F.R.P.S. Crown 8vo. With 66 Illustrations and Diagrams. 2s. 6d. net.

SOLENOIDS, ELECTROMAGNETS AND ELECTROMAGNETIC WINDINGS.
By CHARLES UNDERHILL, Assoc.Mem.A.I.E.E. Cloth. 218 Illustrations. 8s. net.
The rapid development of remote electric control, and kindred electro-mechanical devices wherein the electromagnet is the basis of the system, makes the need for accurate data, regarding the design of electromagnets, the more evident.

10, Orange Street, W.C.

station at Cullercoats is also described. The author, however, remarks that "the exact details of the equipment of the large radiotelegraphic stations are difficult to obtain, and, owing to improvements, are subject to alterations. Any statistics, therefore, of the type of equipment are but of temporary interest." The final chapter deals with wireless telephony, but the treatment is necessarily not so full as that of the older part of the subject. The nature of the difficulties yet to be surmounted is indicated, and work already accomplished is described. It is a pity that two obvious misprints have remained undetected in the very last paragraph.

Taking the work as a whole, there is no doubt that it should be regarded as the standard work on the subject, for there is no other volume with anything like its completeness, or with as thorough a treatment of the theoretical side of the subject.

Continuous Current Machine Design. By W. Cramp. 240 pp. 8¾ ins. by 5½ ins. 137 illustrations. (London: Harper & Bros.) 5s.; abroad, 5s. 6d.

THIS is a text-book of practical designing suitable for students who are already acquainted with the theory of the subject, but who wish to study it from the commercial standpoint. Throughout the book the author shows a full appreciation of the influence of cost, and also of the possible discrepancies under practical conditions between calculated and actual values. Only normal designs are considered; such special machines as turbo-generators and variable-speed motors are not included. Interpole designs are fully dealt with, however, and much space is given to the question of temperature rise as limiting the outputs of such machines. The author has evidently carefully studied the methods of other authorities, and in many cases makes most interesting comparisons of these. The section on temperature rise is particularly instructive, and there is a very useful chapter on armature windings. The difficulties of commutation are clearly explained, Hobart's approximate method being utilised for estimating the reactance voltage. The chapter on general mechanical construction and that on methods of estimating the approximate relative costs of alternative designs should be of particular help. The book concludes with some examples of procedure in design.

Standard Handbook for Electrical Engineers. Third edition. 1497 pp. 6¾ in. by 4¼ in. Several hundred figures. (London: McGraw-Hill Book Co.) 17s. net. Abroad, 17s. 6d.

THERE are numerous electrical works of the pocket-book or handbook class, but we have not met with many that are more complete than the one before us. It must, of course, be understood that the book is an American production, and, being primarily addressed to readers on the other side of the Atlantic, relates entirely to standard American practice. This is not such a disadvantage to English readers as might be supposed at first, as the differences are not really very great, and indeed in certain branches of electrical engineering, such as traction and telephony, it was upon American experience that British practice was subsequently founded. Treating the work as a complete compendium of American electrical engineering with a broad range, a wealth of detail and a commendable conciseness, we have little criticism to make, but the use throughout of the Brown & Sharpe wire gauge and the circular mil may cause a little inconvenience to readers on this side. Again, one turns usually to a work of this class for the various rules and regulations under which schemes have to be carried out in this country, such as those of the Board of Trade, the Home Office, the Insurance Companies, and the Wiring Rules of the Institution of Electrical Engineers. The very excellent standardisation rules of the American Institute of Electrical Engineers and the American "National Electric Code" are interesting, but have not the same application here. Nevertheless there is a vast store of well-arranged information and tabular matter of the utmost value to engineers in all countries, and this, the third edition, has been thoroughly revised by the various authors responsible for the different sections of the book. The compiler of the greater part of the volume is Mr. Otis A. Kenyon, and among other well-known contributors are Dr. A. S. McAllister, Mr. H. M. Hobart, Dr. Louis Bell, and five or six other technical writers.

An Important Series of Articles

IS NOW APPEARING IN

THE ELECTRIC JOURNAL

ON THE

Winding of Dynamo-Electric Machines

These deal with small direct-current machines, induction motors, railway motors, large direct-current machines, large alternating-current machines, and turbo-generators.

THE ELECTRIC JOURNAL

can be obtained from all newsagents and bookstalls.

FOR ARC LAMPS AND OTHER LIGHT WEIGHTS

The Application of Arc Lamps to Practical Purposes. By Justus Eck. 101 pp. 8¼ in. by 5½ in. 92 illustrations. (London: S. Rentell & Co.) 2s. 6d. net. By post, U.K., 2s. 9d.; abroad, 2s. 10d.

It is only within recent years that scientific methods have been applied to artificial illumination, and though much has been written on the subject, there is certainly a need for a good book dealing with the various methods of illuminating by artificial sources of light. The present work covers the applications of arc lamps only, but contains a large amount of useful information and data which should be of considerable value to the electrical engineer. Such points as the choice of carbons, the proper selection and disposition of the lamps to obtain the most satisfactory results for different purposes, are dealt with in a useful manner, and the collection of descriptions of the mechanisms of the various lamps will be duly appreciated by the practically inclined reader. Mr. Eck can, of course, write with authority on all questions connected with arc lighting, and on technical matters is above criticism. We are bound to say, however, that there is room for improvement in the literary style of the writing, and that the significance of some of the tables and diagrams might be more clearly brought out. The use of the Lux or Hefner candle-metre as the unit of illumination seems a mistake in view of the general acceptance in this country of the British candle-foot, and the combination of the Lux with areas in square feet in one table is a regrettable oversight.

The Theory of Ionisation of Gases by Collision. By J. S. Townsend. 88 pp. 7¾ in. by 5 in. Twelve figures. (London: Constable & Co., Ltd.) 3s. 6d. net; by post, 3s. 9d.

The author in this little book propounds a theory of ionisation by collision in order to explain the development of currents in gases. He says in his preface that "researches have brought to light the fact that ionisation by collision takes place when comparatively small potential differences are established between electrodes in a gas at a suitable pressure, so that considerable multiplication of the ions may be obtained by this process with 40 or 50 volts, consequently with comparatively small velocities of the ions." This, of course, is quite different from what happens in cases of ionisation by means of radioactive substances, or by cathode rays. In such cases the ionic velocities are extremely high, as they are produced by the potentials of the order of thousands of volts.

The book is divided up into four chapters: (1) Ionisation by negative ions, (2) ionisation by positive ions, (3) sparking potential in a uniform electric field, (4) theory of electric discharges in fields of force which are not uniform.

It is strange how most new theories when first propounded meet with intense opposition. The theory of ionisation in aqueous and other solutions had to run the gauntlet of most severe, sometimes ludicrous, criticism, but it triumphed, because it could be demonstrated experimentally. Ionisation, to explain conductivity in gases, was a necessary corollary, although, perhaps, not at first sight an obvious one. It, in turn, met with opposition and scepticism; but it again admits of experimental verification. Prof. Townsend's book is based on experiment, but, of course, such a subject has also to be treated mathematically. The mathematics will make it difficult for some, but, on the whole, we consider it clearly written and expressed.

Depreciation of Factories, Mines, and Industrial Undertakings, and their Valuation. By Ewing Matheson. Fourth edition. 230 pp. 8¾ in. by 5¼ in. (London: E. & F. N. Spon.) 10s. 6d. net; abroad, 11s.

Mr. Matheson's book well deserves to have reached a fourth edition. There is no manager of a manufacturing concern who would not profit by its perusal, and the general principles upon which the whole treatment of the subject is based are unimpeachable.

The Indicator Handbook. By C. N. Pickworth. Part I. Fourth edition. 142 pp. 7¼ in. by 5 in. 93 illustrations. (Manchester: Emmott & Co.) 3s. net; abroad, 3s. 3d.

The fourth edition of the first part of Mr. Pickworth's "Indicator Handbook" has been extensively revised and added to. A new section on special indicators for gas and oil engines has been necessitated by recent advances in this field, and some thoroughly up-to-date forms, as the Hopkinson and other mirror indicators, have been included. Extension has also been made in the section on reducing gears in view of applications to gas engines, &c. The volume before us deals with descriptions of

Digitized by Google

actual instruments and notes on their use, with valuable hints as to causes of error; but the working out of results from the diagrams obtained is dealt with in Part II., which forms a separate volume. A review of the last edition of Part II. appeared in ELECTRICAL ENGINEERING of July 21st, 1910.

Practical Testing of Electrical Machines. By L. Oulton and N. J. Wilson. 210 pp. 6½ in. by 4 in. 90 illustrations. (London: Whittaker & Co.) 4s. 6d. net; abroad, 4s. 9d.

THIS little volume contains full instructions for carrying out the usual tests which are made on electrical machines, together with worked examples and typical curves and results for each test described. The latter have been supplied by various well-known manufacturers as representative of modern practice. Methods necessitating alterations to the machines, such as the various ways of loading alternators by splitting up the windings, and others not in general use, such as the loading back on each other of induction motors and railway motors, are not included. The more usual tests, however, are described in a lucid manner, and valuable information of a practical nature as to the methods to be followed in connecting up the machines and instruments and in taking the readings is distributed throughout the book. The first part deals with alternating-current machines, and includes rotary converters and various types of single-phase railway motors. A chapter devoted particularly to direct-current railway motors is also included. It would seem desirable in a future edition of the book to include some notes on the use of the oscillograph. No method of obtaining the wave-form of an alternator is given, mention only being made of the fact that the oscillograph enables one to take it direct and to observe variations.

Engineering Workshop Machines and Processes. By F. zur Nedden. Translated and revised by J. A. Davenport. With an introduction by Sir A. B. W. Kennedy, F.R.S. 216 pp. 8½ in. by 5½ in. (London: Constable & Co.) 6s. net; abroad, 6s. 8d.

THIS translation or adaptation of a German work is particularly directed to students and "others" taking a course of training in the shops of an engineering works. Its object is to set out in a condensed form those matters which a learner frequently finds taken as data, but with some of which he may not already have made himself familiar in his lectures. A number of alterations from the original have been necessitated to bring the work into line with English requirements, and these have involved the omission of some eight chapters relating to the German scheme of technical education. The chapters on materials of construction, foundry and pattern shop, forging, the machine shop, measuring and marking off, and fitting, erecting, and turning, are, however, translated direct from the German, but the translating is so excellent that they are thoroughly English in character. The introductory chapter is new, and a chapter consisting of a description of a typical English works, that of Messrs. W. H. Allen, Son & Co., at Bedford, has been added. An interesting introduction is provided by Sir Alexander Kennedy, and the full report of the Committee on the Education and Training of Engineers, appointed by the Council of the Institution of Civil Engineers (1906) is reprinted as an appendix by permission of the Institution. This report lays stress on the desirability of adequate workshop training for all classes of engineers.

Elementary Treatise on Electricity and Magnetism. By Prof. G. Carey Foster and A. W. Porter. Third Edition. Founded on Joubert's "Traité Elémentaire D'Electricité. 633 pp. 8¾ in. by 5½ in. 377 illustrations. (London: Longmans, Green & Co.) 10s. 6d. net; abroad, 11s. 2d.

THE rapid advance of science, both pure and applied, causes even the most excellent works to become soon out of date, but there is no reason why their good points in method and exposition should not be embodied, with due acknowledgment, in the treatises which supersede them. It was with this end in view, presumably, that the present work was founded on Joubert's famous treatise, and it is no disparagement to the original to say that the authors might have allowed themselves greater freedom in departing from their foundation with advantage. Many of the experiments described might have been superseded by others bearing more closely on practical work, and the illustrations and diagrams are also, in many cases, too reminiscent of the early text-books. The general theory has, however, been brought well up to date by suitable modifications and additions, and a chapter at the end of the volume introduces the student to the results of the most modern researches, including the cathode stream, Röntgen and Becquerel rays, and a brief account of recent investigations bearing on the modern theory of electrons. The chapter on terrestrial magnetism has been revised with the assistance of Dr. C. Chree. The concluding chapter, "Miscellaneous Technical Applications," is too superficial to be of much use, nor is it always accurate, as for example, where the Osram lamp is described as having a filament "principally of Osinium."

"ELECTRICAL ENGINEERING" LIST OF SELECTED TECHNICAL BOOKS.

We shall be pleased to send any of the following books to addresses in the United Kingdon at the *net* published prices named, unless otherwise stated. The increased price for sending abroad is also quoted after each book. All the books listed have been recommended by our editorial staff and reviewers.

Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-206 Temple Chambers, Temple Avenue, E.C., and should be accompanied by a remittance.

MAGNETIC PROPERTIES OF IRON AND STEEL IN INTENSE FIELDS

A PAPER by Sir Robert A. Hadfield, F.R.S., and Prof. B. Hopkinson, F.R.S., entitled "The Magnetic Properties of Iron and its Alloys in Intense Fields," was discussed at the London meeting of the Institution of Electrical Engineers last Thursday. The authors described a long series of tests which they had made of the magnetic quality of iron and various alloys in the region of saturation, where the value of $4\pi I$ (the amount by which the induction exceeds the magnetising force) is practically constant. They attach great importance to the saturation value I, and propose to call this constant the "magnetism" or specific magnetism of the material.

Most steels, they remark, consist of a mixture of constituents, the arrangement of which is an important factor in the results of magnetic testing of the ordinary kind. The arrangement of the constituents as revealed by the microstructure is dependent upon a great variety of circumstances, and this makes it hopeless to look for any simple quantitative relation between the magnetic properties of an alloy as ordinarily tested and its composition. When the alloy is saturated, however, this complication disappears.

The tests were carried out by the isthmus method, with a search coil over the short cylindrical specimen between the poles of a powerful electromagnet, and the change of flux, on reversing the current in the main magnet coils, was measured by the throw of a ballistic galvanometer. Fields up to 25,000 C.G.S. units could be obtained. Various causes of error were carefully investigated, and corrections introduced where necessary. The value of $4\pi IS$ (where S is the sectional area of the test piece) was calculated from the difference between the throws of the galvanometer with the test piece in place, and with a brass cylinder substituted, corrections being made for the redistribution of the flux. In some tests a magnet with a laminated magnetic circuit was used, provided with two similar search coils, only one of which contained a specimen, and these were connected in opposition, so that the required difference could be obtained with one observation. Very numerous tests were made, of which results are given in the Paper, and from them the following general conclusions were drawn:—

Every alloy examined, without exception, has a definite saturation intensity of magnetisation. In most cases this is reached in a field of 5,000 units, but in a few there is a small increase, as between 5,000 and 25,000. The forms of the curves of magnetisation connecting I and H in these exceptional materials, however, leave no doubt of the existence in them also of a saturation value of I. Every one of the materials tested, without exception, behaves as though it consisted of a mixture of magnetic substances with non-magnetic substances having a permeability not differing materially from unity. This holds good also for the non-magnetic or nearly non-magnetic nickel or manganese alloys which appear to be saturated at about 7,000 to 8,000 C.G.S. units, and, in this respect, the results differ from those obtained by Ewing and Low—according to whose experiments a nearly non-magnetic manganese steel had a constant permeability of about 1·4. According to these experiments on the non-magnetic steels, however, the difference in the values of I does not in any case exceed 30 units. Among all the alloys tested there is none having a constant permeability differing from unity by more than 2 per cent.

There is no alloy having a higher magnetism than has pure iron. The saturation value of I for pure iron of density 7·80 in absolute units is 1,675 within 1 per cent. (This is slightly lower than the values obtained by Ewin and Low and other experimenters.) Among the alloys there are two whose magnetism is greater than the sum of that of their constituents taken separately. One of these contains 11·4 per cent. of nickel.

It appears that the less-magnetic alloys behave as though they consisted of some substance having a permeability which does not differ from unity by more than 2 or 3 per cent. mixed with varying quantities of magnetic matter which is practically saturated with magnetism in a force of 8,000 C.G.S.

In an annealed iron-carbon steel in which other elements are present in small proportions the specific magnetism is less than that of pure iron by a percentage equal to six times the percentage of carbon. This result constitutes a verification, in the case of annealed iron-carbon alloys, of the linear relation of the magnetism of a mixture with the magnetisms of its constituents. In this case there are two constituents, mechanically mixed, viz., pure iron and iron-carbide, the percentage of iron-carbide being 15·5 times that of the carbon in the steel. It is readily deduced that the magnetism of carbide of iron is about two-thirds of that of pure iron.

Quenching an iron-carbon alloy from a high temperature reduces the specific magnetism by a large but somewhat uncertain amount. The addition of silicon or aluminium to iron results in a reduction in specific magnetism which is roughly in proportion to the amount added as though the addition behaved as an inert diluent. If carbon be present, however, silicon seems to neutralise its action to some extent. For instance, an alloy containing 2·28 Si and 0·67 C is 3·6 per cent. less magnetic than pure iron, whereas if the carbon had its full effect as in iron-carbon alloys, and the silicon were simply an inert diluent, the reduction would be 6·3 per cent.

The observations on the alloys of iron with nickel and with manganese, or with both these elements, have failed to reveal any simple relation between their magnetism and their composition. It is probable that this is due to the peculiar effects of heat treatment on these substances. When these effects are sufficiently known it may be possible to apply to the manganese and nickel alloys the same kind of magnetic analysis as has been applied to the carbon steels.

Discussion.

Dr. Silvanus P. Thompson, F.R.S., wished to know the upper limits of magnetising force to which the experiments had been carried, and the limits of permeability to which the specimens had been reduced. With regard to Hadfield's non-magnetic manganese-steel, the late Dr. John Hopkinson gave a permeability of 1·3 and Dr. Ewing gave 1·4. It was difficult to understand how that material could be what it was if it had a constant permeability, and did not, like all other specimens, have a diminishing permeability on very high fields. A most important point had been established in the Paper, viz., that every single specimen of iron or steel behaves magnetically as the sum of its separate constituents. He hoped that the authors would proceed in their tests of specimens quenched at different temperatures.

Mr. J. E. Sears asked if it had been proved that a compound behaved as a mixture. With regard to the iron-nickel specimens, were any experiments made up to, say, 43 per cent. nickel? The authors spoke of 24 per cent. nickel as the highest.

Mr. W. M. Mordey said that pure iron was a very unstable material from the point of view of dynamo and transformer construction, as its physical qualities changed very much, and particularly with regard to hysteresis, and it was not one to be looked forward to in this connection with any great hopefulness. He would have liked particulars of the specific resistance, as this was increased to some 300 or 400 per cent. by causes which did not affect the magnetic qualities prejudicially throughout the range required for practical work. Figures of the hysteresis losses would also be valuable. He suggested to the authors some further researches in order to discover an iron or iron alloy that would have a very high permeability at a very low density.

Mr. W. H. Murdoch thought the ballistic method of testing with complete reversals was open to certain objections. He had made a rough instrument in which the ballistic reversal method was entirely avoided, but had not had time to develop it further.

Mr. G. G. Stoney expressed the hope that the authors would continue their work on non-magnetic alloys, so as to get one that could be machined. If they could get one with, say, 35 or 40 tons tensile strength and with 30 per cent. elongation, it could be used for high-speed armatures and rotors. Perhaps they might eventually get a material that could be machined first, and then, by suitable treatment, be rendered non-magnetic.

Prof. J. T. Morris (East London Technical College) mentioned the action of manganese under magnetic forces, and said there was a feeling that manganese would be found to be a magnetic body. Its atomic weight was very close to that of iron, nickel, and cobalt, and it was possible that at low or high temperatures it might pass some critical point and become magnetic. His brother, Dr. D. K. Morris, some years ago investigated a method of producing high flux densities up to 20,000 lines per sq. cm. by means of a transformer. He used alternating current, and although this introduced some complications, at the same time it did away with a number of the difficulties experienced by the authors.

Mr. T. H. Churton asked if any experiments had been made as to the change, if any, in the molecular structure of the specimens which had been subjected to high magnetism several times. He had known some armature teeth that had been subjected to very high flux densities to break off after being run in such a condition for a comparatively short time. Investigations as to the amount of the actual pull that would be exerted on the teeth showed that it was nothing like sufficient to break off the teeth under ordinary conditions, and it seemed to suggest that the teeth had become brittle in some way. Was this due to the molecular action going on under the reversals of the high field?

Mr. W. H. Patchell, on this latter point, said that some years ago he put in some bare copper battery connections at Maiden Lane station of the Charing Cross Co. After a fire there it was found that every one had gone rotten, not through

Digitized by Google

the fire, but simply with the heavy current. By annealing them they were used again. But he did not think it was altogether due to the heating effect.

Prof. HOPKINSON, in reply, said that, with a few exceptions, all the specimens mentioned in the Paper were tested up to a maximum of 25,000 C.G.S. units. The permeability of pure iron, in a field of 25,000, was about 2. He hoped it would be possible in the future to learn more about the question of quenching. In reply to Mr. Seares, in the case of an iron-carbon alloy, the magnetism was a linear function of the amount of carbon. He did not think that could be regarded as proof that the stuff behaved simply as if it were a mixture, but assuming that it was a mixture of iron and iron carbide, he thought it was proof that they did not influence each other magnetically. Mr. Mordey's remark as to iron being unstable was true in the ordinary fields employed in the ordinary methods of testing, but it ceased to be true with very high values. He had not made any measurements of specific resistance, nor of hysteresis loss. He thought there was something in the complaint against the ballistic method of testing in low fields, but not with high fields when the material became saturated.

MOTOR CONTROLLERS

A VERY complete range of motor controllers are described in a new catalogue issued by the British Thomson-Houston Co., Ltd. (Rugby), which gives a good idea of the thoroughness with which the requirements of widely differing classes of work have been studied. The types dealt with embrace continuous-current drum controllers, with magnetic blow-out where necessary, both for plain rheostatic control with and without braking points, and in special forms for printing-press work. The controllers for alternating-current induction motors are made in a number of patterns, including special oil-immersed designs for mining service, one of which is illustrated in Fig. 1. These are used in conjunction with oil-immersed resistances, to which they are connected by special cables unaffected by oil.

For motors of larger capacity than those for which standard tramway type controllers are listed, contactor control is recommended. The control gear consists of a set of electrically operated switches or contactors for making and breaking the motor circuit, and generally a small hand-operated master controller to admit current to the operating coils of the contactors. The electro-magnetic switch has all the requirements necessary for circuits carrying heavy currents which

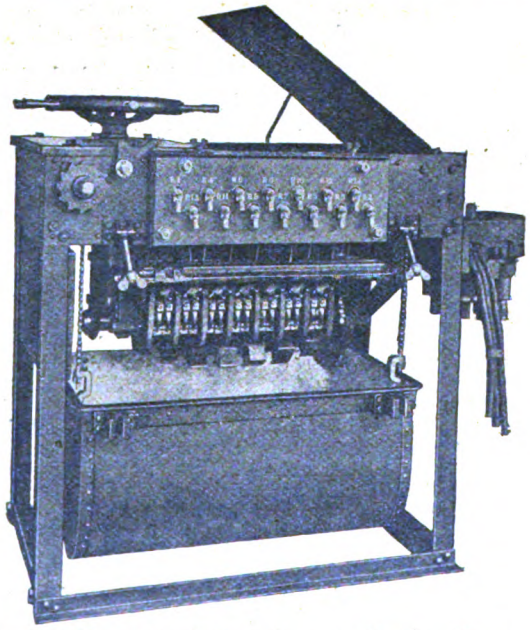

FIG. 1.—OIL-IMMERSED CONTROLLER FOR MINING WORK, WITH OIL TANK LOWERED.

are to be frequently made and broken, as it can be fitted with magnetic blow-out, and its actuating solenoids and compression springs are so apportioned that it will open and close with a quick positive action.

One of these contactors is illustrated in Fig. 2. Each accelerating contactor includes, as an integral part of itself, an overload relay, the plunger of which is held in the open position by a mechanical connection with the contactor until the contactor is closed. When the contactor closes, the plunger is free to drop as soon as the current in the motor armature falls to a predetermined value due to the armature speeding up.

The relay plunger in its lowest position completes the circuit (up to the master controller) of the operating coil of the next contactor. This ensures that after one resistance contactor is closed, the next cannot be closed until the armature current falls to a predetermined value. Such a scheme is suitable where hand control is necessary, and gives protection to the motor equal to that obtained with automatic starting devices. If several hand-control points are not required and the motor is to be started and stopped automatically by the opening and closing of a single switch, the master controller can be replaced by a small single-pole switch.

The drawback to some automatic acceleration systems hitherto designed has been the large number of interlocking contacts necessary for their operation. For this reason time-limit control and systems of counter E.M.F. control have been frequently used. In the former system the apparatus is set by means of dashpots or similar devices to start always in a certain period independent of the load. The master controllers for these time-limit systems are dependent for their operation upon dashpots or escapements more liable to derangement from slight causes than master controllers

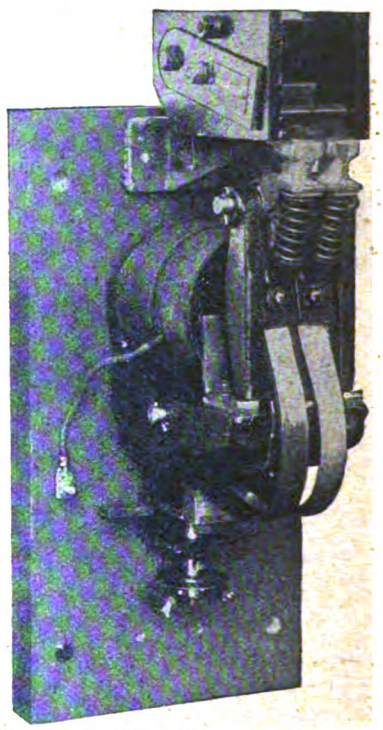

FIG. 2.—CONTACTOR WITH CURRENT LIMIT INTERLOCK.

for either counter E.M.F. or current-limit control. In the counter E.M.F. control the contactors may be made to control the motor by arranging them so that each successive contactor requires a higher voltage to operate it than the one preceding. The contactors are connected in multiple with the armature of the motor, and as the motor comes up to speed, the counter E.M.F. meanwhile increasing, the contactors close in their proper sequence. Although this is a simple form of automatic control it is subject to certain limitations, among which is the effect of abnormal voltage on the line. First—if the line voltage is high, contactors will close prematurely, and if it is low some of them will not close at all. Second—the system is not well suited to series motors without important modifications, for the reason that the counter E.M.F. of a series motor is a function of the current as well as of the speed. The action of counter E.M.F. control is also liable to be interfered with by changes in temperature of the contactor operating coils.

Current-limit control is free from these disadvantages, and is recommended for rolling-mill service, and for all cases where the conditions are such that the motor has to be started, controlled, and reversed on widely different loads. With such control the starting period is controlled by the armature current, light loads being automatically accelerated rapidly, and heavy loads slowly.

The system is equally applicable to continuous and alternating currents. The list also contains numerous patterns of resistance for various classes of service.

ELECTRIC WIRING POWERS

THE discussion upon electric wiring powers which took place on Wednesday last week, at the instance of the Committee for the Protection of Electrical Interests, brought out a few points of interest. The attendance was very meagre, however, as there was obviously a disinclination both on the part of municipal electrical engineers and contractors to discuss the question while it is still the subject of a friendly conference between representatives of the Incorporated Municipal Electrical Association and the Electrical Contractors' Association. Mr. Robert Hammond occupied the chair.

Mr. A. A. CAMPBELL SWINTON, speaking as a director of a number of electric supply companies which have invested large sums of money in electric wiring, said he did not see how they could logically object to municipalities having these powers, but the one point he wished to make clear was that municipalities, when purchasing electric lighting companies, should be forced to purchase their wiring businesses as well. He believed that municipalities held the view that they are not bound to do this. In a recent case the original proposal of the corporation was to ignore the company's wiring business, but fortunately an agreement had been come to.

Mr. W. A. VIGNOLES (Chief Electrical Engineer, Grimsby) gave some figures to show the large increase of consumers owing to the facilities given for the hire of motors. He thought they had to recognise that the electrical industry was largely bound up with municipalities, and it was the action of those corporations who had first taken up the hire and sale of apparatus that had given an impetus to this side of the electric supply business.

Mr. E. GARCKE did not think it was right to put barriers in the way of the efficient development of municipal undertakings, especially as a large number of corporations had already been granted the wiring powers. At the same time, he threw out the warning that local authorities should not make the mistake of thinking that because it was their duty to carry on a particular enterprise, that duty involved the destruction of interests which might be in opposition to their own.

Mr. J. S. RAWORTH, after pointing out that municipalities and companies should stand upon exactly the same footing in this matter so far as having the powers to do wiring, expressed the opinion that it was only right that the work should be placed in the hands of those people who made a speciality of it. A supply station engineer could not efficiently supervise the supply of electrical energy and also its application in consumers' premises. To do this involved depriving those who were specialising in the work from making a reasonable living, whilst at the same time the supply station people made no profit upon it.

Mr. G. HARLAND BOWDEN (President of the Electrical Contractors' Association) said that the conference between the Municipal Association and the Contractors had not broken up, and that it would sit again on the 15th inst. He took the opportunity of saying how the Contractors' Association appreciated the honourable manner in which the municipal engineers had met them in this matter, but in view of the conference still sitting he would not discuss the point of principle in detail.

Mr. W. RAWLINGS said his experience was that consumers resented the supply station authorities wishing to wire and fit their premises, as the feeling existed that the only interest of the supply station people was to increase the supply of energy. He further pointed out that many of the difficulties at present existing between contractors and the supply station authorities were due to a number of petty obstacles, such as refusing to make appointments over the telephone, insisting upon 48 hours' notice to test, and so on.

Mr. F. E. GRIPPER (Edmundsons' Electricity Corporation) expressed similar views to Messrs. Campbell Swinton, Raworth, and Garcke, and as representing companies who also did wiring, said he preferred to encourage contractors than to have to do this himself. His companies did not compete with the contractor except in special cases, and did not cut prices. In many of their towns, however, there were no contractors to compete with.

Mr. HARLAND BOWDEN said that if Mr. Gripper would send him a list of those towns he would undertake that two or three electrical contractors would start business there.

Mr. JUSTUS ECK (Union Electric Co.) complained of manufacturers frequently undertaking wiring work and cutting into a branch of the industry for which they were not fitted.

Mr. R. TWEEDY SMITH (Honorary Solicitor to the Contractors' Association) spoke on the general question of municipal trading in this matter, and mentioned the case of a municipal engineer who, before he undertook the wiring of premises, was making a profit, but afterwards this profit gradually dwindled and a loss was involved. Later on it was found that the wiring business was making a profit but the supply side a loss. He thought it pointed to the moral that supply station engineers had best confine themselves to their own branch.

Mr. ROBERT HAMMOND, in closing the debate, said that it had shown how much could be gained by talking over their differences in a quiet manner, and expressed the hope that contractors and municipalities would come to an agreement, in the general interests of the electrical supply industry. It had been, he said, the original intention of the committee to discuss whether there should be united action in asking Parliament to sanction all electricity supply undertakers to put capital into the wiring of premises, and the hire of apparatus, but the discussion had been rather narrowed down to the point as to who should carry out the work.

ELECTRICITY TESTING STATIONS IN LONDON

Proposed Prosecution

UNDER the terms of London Electric Lighting Provisional Orders the various supply authorities are bound, if so required by the London County Council, to provide testing stations in order that the pressure may be tested from time to time. As the result of suggestions put forward in February, 1909, by a deputation of Borough Councils owning electricity works, the County Council agreed that where the supply undertakings have "pilot wires" leading back from distant points of the mains to generating stations or sub-stations, instruments connected to such pilot wires and fixed in such premises might, in approved cases, in order to save expense, be recognised for the time being as testing stations within the meaning of the Electric Lighting Acts, provided that such instruments are sealed during the course of any testing, and that proof is shown that the wires are properly connected at the distant parts of the system.

The Highways Committee of the London County Council report that for some considerable time they have been in negotiation with the Islington and the Marylebone Councils with a view to securing their compliance with the Council's requirements in this connection, but it appears quite clear that these Councils have no intention of complying or of going to arbitration. In the case of Marylebone, three "pilot wire" stations already exist. The County Council require five, but the Borough Council regard the provision of special premises or of boxes in the streets as unnecessary. The Islington Borough Council also regard the requirements as unreasonable, and point out that the following resolution was passed by a conference on November 11th last, which dealt with this matter. At this conference there were present representatives of the Battersea, Fulham, Hackney, Hammersmith, Hampstead, Islington, Poplar, St. Marylebone, St. Pancras, Shoreditch, Southwark, and Woolwich Councils, and the resolution in question reads, "That it is desirable that the provisions of section 41 (3) of the Electric Lighting Clauses Act, 1899, should apply to local authorities in the metropolis who are electric lighting undertakers in lieu of the corresponding sections with regard to the establishment of testing stations in their respective Provisional Orders." The Highways Committee point out that if this resolution were agreed to by Parliament it would transfer the Council's powers in regard to testing stations to a court of summary jurisdiction which could only act on the application of ten consumers.

The Highways Committee further point out that the establishment of testing stations was initiated about eight years ago by some of the Borough Councils themselves who wished to enforce them upon supply companies. The companies suggested that any such provision should be binding upon both company and municipal undertakings, and this request the County Council regarded as reasonable. As a result, all the companies have met the requirements of the Council. Although, however, there are fourteen Borough Councils owning electricity undertakings, only three, namely, Poplar, Stoke Newington, and Woolwich, have met the Council's requirements.

After pointing out the importance of testing stations owing to the ever-increasing use of electricity for all purposes, and to the fact that the Islington and Marylebone Councils have been shown to have actually supplied current at a "faulty" pressure, the Highways Committee recommend that proceedings should be taken against them to enforce the Council's requirements.

Metal Filament Lamps at a Bowling Green.—The General Electric Co. have sent us some particulars of an installation of five 200 c.p. Osram lamps which are used with great success by a hotel proprietor at Redditch for the illumination of a bowling green. This lighting enables matches to be played at night without difficulty. The green is 45 yards by 25 yards, and the lamps are placed on bracket arms attached to poles, one at each corner. One is also suspended from the centre of a steel wire stretched across the green. The wires are carried round the sides of the green on insulators.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published December 8th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

27,217/09. **Steam Turbine Blades.** A.-G. Brown, Boveri & Cie. Turbine blades are formed from an alloy of pure iron and nickel, which is manufactured in an electric furnace, and must not contain the slightest trace of carbon. This alloy does not rust, and is equal to nickel-steel as regards strength, while it withstands high temperatures without becoming brittle.

28,804/09. **Electrical Propulsion of Ships.** Siemens Bros. Dynamo Works, Ltd., and E. A. Holmes. There are two groups of motor-driven propellers supplied by turbo-alternators of different frequencies. At normal speeds the generators drive the motors of like frequency. For a reduced speed (assuming frequencies of 75 and 50 cycles) the 75-cycle motors are driven from the 50-cycle generators, thus obtaining two-thirds normal speed. For the next speed, the frequency of the generators is halved as described in Patent No. 9,048/09. A fourth speed intermediate between these is obtained by driving the 50-cycle motors by the 50-cycle generators delivering current at half the frequency. Four figures.

29,506/09. **Wall Plug.** A. and G. J. Bonella. To prevent the removal of wall plugs by a direct pull, the plug is provided with a spring catch which enters a recess in the socket and engages with it. The catch is released by means of a button at the side of the plug. Four figures.

6,650/10. **Ignition System.** H. J. Haddan (*L. B. Lesperance, California*). This specification describes apparatus for supplying the sparking plug of an internal combustion engine with a high-frequency oscillatory discharge. A resonator is excited by the discharge of a condenser charged intermittently through an inductance. One figure.

13,520/10. **Circuit-Breaker.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). To avoid burning of the arc shields of the magnetic blow-out, the arc is confined to the centre by a magnetic field produced by the current flowing through the contacts. These are so shaped that the flow of current has a directional component transverse to the shields, and in opposite directions on opposite sides of the central plane between the shields. Four figures.

14,116/10. **Metal Filaments.** Wolfram Lampen A.-G. (Augsburg, Germany). This specification covers a process for decarbonising metal filaments by raising them to incandescence in an atmosphere of menthane gas (CH_4) at a pressure of a few millimetres.

Application for Extension of Life of Patent

11,575/97. **Wireless Telegraphy.** Sir Oliver Lodge. It was announced in Mr. Justice Warrington's Court in the Chancery Division on Saturday that no objections had been entered to the extension of the life of this patent. (*See* Electrical Engineering, October 27th, 1910, p. 685.) Leave was granted to amend the petition with regard to some foreign patents which are referred to. The hearing of the petition will come before Mr. Justice Parker on or shortly after March 20th, 1911. The patent relates to a syntonised system of wireless telegraphy, in which the receiving apparatus resonates in response to a sufficiently prolonged series of waves of a definite frequency, and covers various arrangements of the oscillatory circuits.

Opposition to Grant of Patents

6,138/09. **Aluminium Solder.** C. E. Steinweg. This patent has been allowed in spite of opposition. The specification, abstracted in Electrical Engineering, January 20th, 1910, p. 50, describes tubular sticks of a cadmium alloy of aluminium filled with a special flux.

15,496/09. **Metal Filaments.** R. Jahoda. This patent has been granted in spite of opposition. It covers the use of copper and silver oxides in the manufacture of filaments. (See Electrical Engineering, June 23rd, 1910, p. 415.)

19,872/09. **Electrical Propulsion of Ships.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). The hearing of the opposition to this patent by Mr. W. P. Durtnall came before the Comptroller last week. The patent was abstracted in Electrical Engineering, June 23rd, 1910, p. 415. Mr. Durtnall requires that a reference to his patent covering an electrical reduction drive with polyphase machinery should be inserted. The Comptroller-General reserved his decision.

24,115/09. **Time Lag Device for Circuit Breakers.** G. Ellison. Opposition has been entered to the grant of this patent. It relates to time lag devices of the dash-pot type, in which the piston works in a constricted part of the pot, and covers the formation of this portion to a conical shape, so that the size of the passage between the piston and the cylinder increases as the piston ascends. The piston may be conical also, and means is provided for axially adjusting either so as to vary the lag.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials &c.: Phillips and Hutchings [Apparatus for enamelling wires] 27,569/09.

Dynamos, Motors, and Transformers: Crawford [Train-lighting dynamos] 27,604/09; Walker [Machines] 27,968/09; A.-G. Brown, Boveri et Cie. [Single-phase motors on polyphase circuits] 6,402/10.

Electric Ignition: Maggiora, 28,378/09; R. Bosch, 7,639/10; Justin [Magneto generators] 9,772/10.

Electrometallurgy and Electrochemistry: Helfenstein [Electric furnaces] 26,844/09; Henri, Helbronner, and Von Reckinghauser [Sterilisation of water] 27,798/09; Specialfabrik für Aluminium-Spulen und Leitungen Ges. [Production of insulating oxide layers on aluminium wire] 2,711/10; Fitzgerald [Electric furnaces] 11,718/10; Hiorth [Induction smelting furnaces] 12,214/10.

Switchgear, Fuses, and Fittings: Clarke, Chapman & Co., and Harris [Resistances] 27,922/09; Schultz [Motor-starters] 30,184/09; Orton [A.C. electro-magnets] 620/10; Winsborough [Safety apparatus] 3,013/10; Holmes [Motor-starters] 4,744/10; Houskeeper [Contact devices for use with moving conductors] 7,332/10; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Motor controllers] 9,736/10; Siemens Bros. Dynamo Works (*Siemens Schuckertwerke-Ges.*) [Switches] 10,315/10; Routin [Voltage regulator] 13,709/10; Marmion [Alarm contacts under carpets] 14,742/10; Lundberg [Switches] 18,591/10.

Telephony and Telegraphy: Dick [Wireless apparatus] 27,484/09; Creed and Coulson [Telegraphic transmitters] 5,374/10; Tschörner [Telegraphic transmission of pictures] 13,104/10; Western Electric Co. (*Western Electric Co. U.S.A.*) [Telephone transmitters] 21,285/10.

Traction: Haase [Apparatus for grinding rails] 1,912/10. Asmus [Starting and stopping trains independently of driver] 11,725/10; Shemwell [Operating tramway points] 12,180/10. Dixon [Brakes] 19,568/10.

Miscellaneous: Pringle and Richards [Production of smokeless briquettes from coal] 27,828-9/09; Cletren [Electro-mechanical power transmission] 29,995/09; James (*Compagnie générale de Phonographes*) [Electromagnetic apparatus for cutting out stencils for colouring films] 2,410/10; A.-G. Brown, Boveri et Cie. [Steam and gas turbine installations] 19,750/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: Allgemeine Elektricitäts-Ges. [Compensation of polyphase commutator machines] 26,685/10.

Electrochemistry: Nogier [Apparatus for sterilising liquids by ultra-violet rays] 26,783/10.

The following amended Specifications can now be obtained.

Murphy [Vibratory current rectifier] 5,081/09; Seacomb [Magneto massage machine] 12,844/09.

Application for Revocation

28,475/04. **Mechanical Stokers.** E. E. Taylor (Boston, U.S.A.). Application has been made for the revocation of this patent under Section 27 of the Patents Act, on the ground of inadequate manufacture in this country. The patent covers an underfeed stoker consisting of a retort having a long sloping mouth and reciprocating mechanism for feeding the fuel.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: E. A. Corolan (*General Electric Co., U.S.A.*) [Mercury vapour lamp starting device] 18,344/03.

Dynamos, &c.: British Thomson-Houston Co. (*F. S. Jeannin, U.S.A.*) [Synchronising of A.C. motor-generator sets] 18,329/02.

Electrometallurgy, &c.: P. Gredt [Induction furnace and refining process] 17,178/05.

Incandescent Lamps: W. Nernst [Filament of Nernst lamp] 19,424/97.

Instruments, &c.: W. Stanley and F. Darlington [Magnetically relieving pressure on bearings of motor meters] 19,479/97.

Traction: W. J. Brewer and J. E. Cooper [Motor trucks and gear] 19,579/97.

Miscellaneous: R. Hoenicke [Fire alarm] 18,383/04.

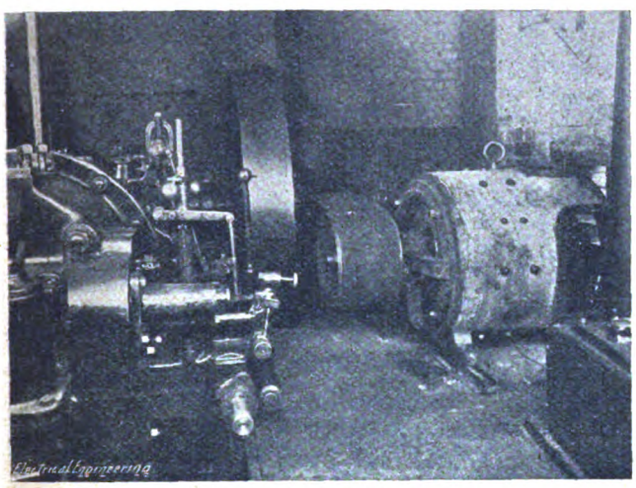
CORRESPONDENCE



To the Editor of Electrical Engineering.

Sir,—I enclose herewith a photograph of a breakdown of a 100-h.p. suction-gas plant at Messrs. George Christie, Ltd., wire drawers and weavers, Broomloan Road, Govan, which caused a complete stoppage of the factory, and was remedied by the Electricity Department installing a motor.

Messrs. Christie telephoned to me at 7.30 a.m. on Thursday, December 1st, and I arranged to meet their manager at their works at 9 a.m., and then agreed to get a motor on hire for them to carry on the work. We telephoned to Messrs. Mavor & Coulson, who fortunately had a 105-h.p. motor of the right speed available.

The mains men were at work in a different part of the town, and we got them on to the job by noon, laid 35 yards of main through frozen ground, and had current in the building by 7.30 p.m. There was unfortunately a delay of six hours in getting the motor, as, owing to a mistake on the part of the carter, it was taken first of all to the wrong place, and did not reach Messrs. Christie's works till 11.30 p.m.

The motor weighed over two tons, and, as will be seen from the photograph, the engine-room into which it had to be taken is very confined and there was no means of lifting it from above, so that it had to be got into position by pinching it along planks laid on the ground. A hole also had to be knocked in the wall to allow the motor to be

Temporary Motor to Take Up Load of Disabled Gas Engine.

placed in line with the driving pulley. In spite of these difficulties the machine was in position and running by 9.45 a.m. on Friday, 24¾ hours after the Electricity Department had undertaken the job. There was then a further delay as the belt had to be lengthened, but this was done and all the factory running by 3 p.m., **exactly 30 hours after** the commencement of the job.

This is the second gas-engine breakdown that the Electricity Department has remedied in the past six months, the previous one being one of 40 h.p., when a 45-h.p. motor was installed in its place within 24 hours' notice of the breakdown being received. In this case the owner decided to keep the motor. The department also brought current into an engineering works only the previous day to replace a broken-down engine.

The photograph had to be taken through a window from the outside of the engine-room, as there was no room to get the camera inside. It is interesting to notice the difference in floor space taken by the two machines, and it must be borne in mind that the space taken up by the suction plant itself is not shown, and takes quite as much room as the engine.

Yours truly,

Burgh of Govan Electricity Works, T. C. Parsons.
December 6th, 1910.

"Onewatt" Lamps.—Messrs. Siemens Brothers Dynamo Works, Limited (Tyssen Street, Dalston), advise us that they are shortly placing on the market a range of 50-c.p. "Onewatt" lamps, with drawn tungsten filaments, for 100 to 130 and 200 to 250-volt circuits, for street lighting only. Messrs. Siemens are making a speciality of street lighting schemes with these lamps, as will be seen from our "Tenders Accepted" columns.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

LIFTS.—Messrs. Aldous & Campbell, Ltd. (21 Lower Bland Street, Great Dover Street, E.C.) have sent us a series of blotters which they are issuing. One of these carries a view of their works, and the others illustrate some of the types of lift made by them, including push-button control passenger lifts, electric goods, and service lifts. Attention is drawn particularly to their arrangements for inspection and maintenance contracts.

CALENDAR.—An attractive wall calendar for 1911, bearing a very effective embossed representation of a group of statuary, is being distributed to their friends by the United States Metallic Packing Co., Ltd. (Soho Works, Thornton Road, Bradford).

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ARC LAMP ACCESSORIES.—New lists are to hand from the North-Western Electrical Appliance Co. (Cathcart, Glasgow), dealing with arc lamp lowering gear, including automatic locking contact suspension gears, self-sustaining winches, &c., and particulars of these and other accessories for various forms of arc lamp suspension are given on a large coloured sheet.

DECORATIVE LIGHTING AND SIGNS.—The Electrical and Engineering Supplies Co., Ltd. (36 and 37 Upper Thames Street, E.C.), describe in a new leaflet a series of outfits for Christmas-tree and other decorative lighting with miniature lamps arranged in suitable small holders in series. Other leaflets deal with small flashing signs for shop windows, counters, &c., motor-driven automatic sign flashers, and a number of patterns of exterior illuminated signs.

TANTALUM LAMPS AND HOLOPHANE SHADES.—The advantages of lighting by tantalum and "Onewatt" lamps in conjunction with holophane shades are well pointed out with the aid of illustrations of actual installations in a new booklet issued by Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston). The company are willing to send a copy of this attractive little publication to all interested.

Optical Convention.—At a meeting at the rooms of the Chemical Society on Tuesday, November 29th, it was decided to hold an Optical Convention in the spring or early summer of 1912.

Tramway Brakes.—We have received from the Electro-Mechanical Brake Co., Ltd. (West Bromwich), who are the proprietors of the "Maley" track brake, a pamphlet containing some correspondence between them and the manager of the Glasgow Corporation tramways. It will be remembered that the company were somewhat dissatisfied with the results of some tests of their brake described in a Paper read before the Institution of Electrical Engineers (see Electrical Engineering, April 14th, p. 249), and claimed that the trials had not been made under best conditions. They issued a reply to the Paper, in which they expressed their readines to refit the brake for further tests. It now appears that the chief point in dispute is that the proportioning of the resistances and the further trials have fallen through owing to Mr. Dalrymple (Tramways Manager, Glasgow Corporation) not having seen his way to permit alterations of the resistances belonging to the standard equipments.

An Electrically-Propelled Fire Engine.—Messrs. Merryweather & Sons (63 Long Acre) have sent us some particulars of an electrically-propelled "first aid" fire engine which they have placed on the market. The vehicle carries eight men, and is equipped with a gas cylinder and 30-gallon tank, enabling a jet to be thrown for ten minutes, while hydrants or suction hoses for other engines are being coupled up, and carries a 30-ft. extension ladder and a supply of 1,000 ft. of hose, with standpipes, &c. It is propelled by two independent motors, one driving each rear wheel through worm-gear and side chains. The accumulators are of the special light traction type of the Electrical Power Storage Co., and are of sufficient capacity to take the engine twelve miles out and twelve miles back. A maximum speed of 20 miles per hour is attainable on the level. The engine is of particular interest as being the first all-British machine of its kind. Electrically-propelled fire appliances are much commoner on the Continent than in this country, and in some towns, especially in Austria, are used exclusively.

OSRAM-LAMPS

Digitized by Google

LOCAL NOTES

Bournemouth: *Tramways Profits.*—The gross profits on the tramways for the first half of the current financial year amount to £23,224, against £18,901 in the corresponding period of the previous year.

Burnley: *Tramway Through-Running.*—The Colne & Trawden Light Railway Co. have proposed a scheme of intercommunication between their tramways and those of the Burnley Corporation.

Colchester: *Mails by Tramcar.*—An arrangement has been entered into with the Post Office for carrying mailbags on certain routes.

Dudley: *Charges for Tramway Energy.*—Some dissatisfaction is being expressed at the result of the recent award in connection with the price which the Tramway Company is to pay the Corporation for electrical energy. On the new basis the revenue from the company will be decreased by about £1,000 a year, and as the electricity works incurred a loss of £600 last year, the award is not viewed with favour.

Glasgow: *Tramways.*—The total length of the Glasgow tramways now amounts to 97¾ miles. Since the beginning of the financial year on June 1st, 116,958,329 passengers have been carried, which is about 5,500,000 more than in the corresponding period of the previous year.

Glasgow: *Interruption to Supply.*—Last week a short-circuit occurred on a 0·2 sq. in. trunk main running between the Port Dundas and Pinkston power stations. This had the effect of causing such a serious drop on the extra high tension pressure that the motor generators and rotaries in the sub-stations connected to Port Dundas all shut down. As quickly as possible the switch on the trunk main was tripped by hand, although it would have been automatically tripped by the overload relay. The fault was located to a manhole about 300 yards from Port Dundas station, and fully a yard of 0·2 sq. in. 3-core cable was burned out. The southern and western districts of the city were hardly affected, but the central area was seriously affected from 10 to 20 minutes.

Ireland: *Electric Lighting.*—The public lighting of Ballyclare was inaugurated on Saturday.

Kent: *Electricity Supply.*—It is proposed to form a company to supply electricity in the towns of Sandwich, Deal, and Walmer.

Liverpool: *New Telephone Exchange.*—The Bank exchange of the Liverpool telephone service was opened on Friday.

London: *County Council: Ventilation of Street Boxes.*—With reference to the proposal to render it compulsory for the Post Office and National Telephone Co. to ventilate their street boxes as suggested by several London Borough Councils, the County Council consider it undesirable that any step in this direction should be taken at the present time.

City of London.—A new telephone exchange is to be erected by the Post Office in St. James's Place, E.C.

Manchester: *Tramway System.*—In the Divisional Court last week the National Association of Carriage Owners sought to compel the Manchester Corporation to fix a definite distance between their tramcars in the central area. Under the Corporation's Act of 1900 there is a statutory obligation to make bye-laws in relation to the distance at which tramcars should be allowed to follow each other. The Corporation left the control of the tram traffic to the police, but the Court held that they were bound to fix the distance themselves. On the surface the action seems somewhat trivial, for, as is pointed out by a Manchester contemporary, the Corporation have only to pass a bye-law to fix an interval between the cars of anything short of bumping.

Newark: *Electric Supply.*—It is proposed to form a company to take over the Council's Electric Lighting Orders of 1900 and 1907.

Oldham: *Supply Outside District.*—The Board of Trade have refused the Corporation an order to supply electricity in Chadderton, Royton, and Limehurst, which are beyond the borough boundaries. The reason given is that the supply proposed is such that a Provisional Order should be applied for.

St. Andrews: *Street Lighting.*—The Council are discussing a new contract with the Electric Supply Corporation for street lighting.

Scarborough: *Tramway Service.*—The Scarborough Tramways Co. have not yet complied with the order of the Board of Trade to run a winter service. An offer to commence the service on condition that the Corporation reimburse the company any loss they may sustain has been refused by the Corporation.

Southend: *Tramways.*—At the last meeting of the Council a scheme of tramway extensions prepared by the Tramways Committee was discussed at considerable length. All the lines were sanctioned with the exception of one down the High Street.

Sunderland: *Electricity Tariffs.*—The Electricity Committee have prepared a scheme of tariffs for lighting houses on the rateable value system. A fixed rental, varying from 10 per cent. to 15 per cent. per annum on the rateable value for houses from £15 to £70 rateable value, plus ¼d. per unit metered, is suggested, the percentage to be varied where the assessment is influenced by causes which do not affect the use of electricity. For offices and banks an alternative tariff is proposed of 3d. per unit where not less than 70 units per annum are used per 100 watts. For heating and cooking the charge is to be ¾d. per unit in premises electrically lighted. For low-tension power supply an alternative tariff of £3 per annum per kilowatt of maximum demand, plus ¼d. per unit, is proposed. Meter rental will not be charged in the case of the new tariff for domestic supply. An alternative scale has also been prepared for lighting shops, warehouses, theatres, concert and picture halls, &c.

Torquay: *Tramways.*—At a special meeting dealing with the tramways it was announced that subject to the Council waiving their right to bring points of law before the courts in regard to the arbitration, the company have expressed their willingness to pay the costs of the arbitration on condition that the Council contribute £500 and bear the cost of the award. The Board of Trade have granted an extension of two months in which the Dolter system is to be removed. The Tramway Company have asked for an early reduction in the price charged for current instead of waiting for the expiration of the period provided by the Act. If the Corporation will consent to this, the company will take a supply for a period of seven or nine years.

Uttoxeter: *Electric Lighting.*—An electric lighting scheme is under consideration.

West Hartlepool: *Tramway Arbitration.*—It is expected that the arbitration with regard to the purchase of the Tramway Company will take place in January.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—Two 750-kw. sub-station units are required by the New South Wales Government railways. Tenders by January 23rd, and particulars from Electrical Engineer's Office, 61 Hunter Street, Sydney, N.S.W.

Bedford.—Mains are to be laid along London Road for street lighting.

Bradford.—An application is to be made for a loan of £60,000 for extensions to the electricity mains, &c.

Ealing.—Application has been made for sanction to a loan of £20,000 for electrical extensions.

Eastbourne.—Application has been made for a loan of £8,000 for electrical extensions.

East Ham.—A 1,000-kw. triple-expansion engine and generator is required, together with an evaporative condenser, air pumps, circulating pumps, &c. (See an advertisement on another page.)

Fareham.—A loan will shortly have to be taken up for house services, and an additional feeder at an estimated cost of £550.

Ireland.—A scheme of electric lighting in Dungiven (co. Derry) is under consideration. Mr. A. Semple, J.P., who has a mill in the district, proposes to erect generating plant in connection with it.

Leyton.—The Electricity Committee require a 600-kw. mixed-pressure turbine set. Particulars from the Engineer and tenders by December 29th.

Llandudno.—A motor-driven induced draught plant and two mechanical stokers are required. Particulars from the Engineer, and tenders by December 24th.

London: *County Council.*—Tenders are invited by January 10th for high- and low-tension switchgear. Particulars from the Clerk.

Hackney.—Some small extensions of mains are to be carried out.

Hammersmith.—Application is to be made to the L.C.C. for a loan of £5,429 for electrical extensions.

Digitized by Google

Maidstone.—A new main is to be laid in Hastings Road at a cost of £160.

Portugal.—The *Board of Trade Journal* states that the Companhia Carris de Ferro do Porto have applied for power to construct an electric railway in Oporto.

Turkey.—The Turkish Ministry of Public Works, says the *Board of Trade Journal*, are inviting tenders for a concession for working electric tramways in Adrianople, and for an electric lighting undertaking in the Sandjak of Adrianople. Tenders to Monsieur le Ministre du Commerce et des Travaux Publics, Constantinople. A list of commission agents established in Constantinople may be seen at 73 Basinghall Street, London, E.C.

West Hartlepool.—A sub-committee has been appointed in connection with an application to the Local Government Board for a loan for extensions at the electricity works.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Church on L.C.C. housing estate, Tottenham.

Proposed new buildings on site of present Middlesex Guild hall, Westminster.

Electric lighting installation at new County High School, Leytonstone. Architect, W. Jacques, 2 Fen Court, Fenchurch Street, E.C.

Buildings on sites of numbers 25 to 34, and 39 to 47 Pickering Place, Paddington, and 98 Bishop's Road.

Buildings between Nos. 641 and 645 Holloway Road, Islington.

New telephone exchange, Ilford. H.M. Office of Works.

Alterations and additions to Mount Pleasant Parcel Office. Architect, J. Rutherford, 22 Carlisle Place, S.W.

PROVINCES.

Aberdeen.—Proposed additional Public Baths.—Extensions at Technical College.

Aberystwyth.—Isolation Hospital.

Bangor.—Infirmary.

Barrow-in-Furness.—New fire station.

Birkenhead.—School in Temple Road.

Birmingham.—Additional departments for cookery, laundry, and manual work at various schools.—The late Mr. John Feeney has bequeathed £50,000 for building a picture gallery on a site to be provided by the Corporation. Three galleries are to be added to the Art Gallery at present in course of erection.

Camborne.—Public hall and shops.

Carlisle.—New Court House. Architect, G. Dale Oliver.

Chislehurst.—Electric theatre, Sidcup Hill.

Darlington.—Business premises in Park Gate.

Derby.—Congregational Church, Cordon Street.

Glasgow.—Extensions to Poor-house at Craw Road.—Proposed Branch Library at Saracen Street.—Branch bank for British Linen Bank.

Gravesend.—Alterations to Town Hall.

Handsworth.—Assembly Hall, Lecture Hall, and Primary School.

Hull.—New training college, Cottingham Road. Architects, Messrs. Crouch, Buller & Savage, Birmingham.

Leeds.—Alterations and additions to Guardians' offices.—Additions to imbecile wards at Beckett Street Workhouse.

Llandrindod Wells.—Pavilion on recreation ground.

Llandudno.—West Shore Church.

Manchester.—Alterations and additions to Municipal School. Accountant, Education Offices.

Newton Abbot.—Additional ward at the Infirmary. Clerk of the Guardians.

Nottingham.—Public baths in the Meadows district.

Swansea.—The local Y.M.C.A. have purchased a site for new headquarters.

Watford.—Extensions to County Court. Registrar, County Court Offices.

Wimborne.—Elementary School for Dorset County Council.

MISCELLANEOUS

Blackpool.—The Corporation have received sanction for a loan of £3,400 for the purchase of six new tramcars.

The Tramways Company are to relay the tramway track along Central Beach.

Buenos Aires.—The Buenos Aires Western Railway Co., which has a concession for constructing an underground electric railway in Buenos Aires, have undertaken to sign the contract for the work in six months, and to submit the plans and specifications within twelve months.

Darwen.—Meters are to be placed on all the tramcars of the Corporation.

Derby.—It was stated at the last meeting of the Council that at the present rate of progress new tramcars will soon be required.

London: *St. Pancras.*—The Finance Committee of the L.C.C. recommend sanction to a loan of £2,582 for electrical extensions.

Stepney.—The Finance Committee of the L.C.C. recommend sanction to a loan of £10,000 for electrical extensions.

Manchester.—The Tramways Committee require tenders for the supply of special track work. Particulars from the General Manager, and tenders by January 9th.

TENDERS RECEIVED AND ACCEPTED

Blackburn.—Mr. R. Baron, of Fleetwood, has received the contract for an electric lighting and power installation at the new works at Wyre Dock of the Fylde Ice & Coal Storage Co.

Brighton.—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained the annual contract for street lighting with 50-c.p. "Onewatt" lamps.

Calcutta.—The Maschinenfabrik Oerlikon have recently received orders for 10,000 kw. of plant for the Calcutta Electricity Supply Corporation. This includes three 3,000 three-phase turbo-generators, and an 800-kw. mixed-pressure turbine and three-phase generator complete with condensing plant and air circulating pumps driven by Oerlikon motors.

Derby.—The tender of Messrs. Chamberlain & Hookham, Ltd., for tramcar meters at £152 15s. has been accepted.

London: *County Council.*—The following tenders have been received for electric lighting at the new fire station in course of erection in Brunswick Road, Poplar:—G. Harland Bowden & Co., £156 14s.; Waring & Withers, £184 8s.; G. E. Taylor & Co., £192. The first tender is recommended for acceptance.

The Highways Committee recommend the acceptance of a tender by Messrs. Walter Scott, Ltd., at £32,855 for track rails and fastenings, and that of the Frodingham Iron & Steel Co., Ltd., at £6,913 15s. for conductor rails.

The following tenders have been received for the supply of overhead electrical equipment for the Putney Bridge to High Street, Wandsworth, trams:—Clough, Smith & Co., Ltd., £2,015 14s.; British Insulated & Helsby Cables, Ltd., £2,222 5s.; Dick, Kerr & Co., Ltd., £2,257 14s. The Highways Committee recommend the acceptance of the first-named tender.

In connection with the reconstruction of the horse tramways from Finsbury Park to Southgate Road, it is proposed that the following portions of the equipment be placed in the hands of contractors carrying out existing contracts for the Council:—Cables, W. T. Henley's Telegraph Works Co., Ltd.; duct laying, Reid Bros., Ltd.; switchgear, Johnson & Phillips, Ltd.; motor generators, Dick, Kerr & Co., Ltd.

The tender of the James Keith & Blackman Co. for an ash dust removing plant at the Greenwich generating station at £3,507 15s. is recommended for acceptance.

The tender of the Medway Safety Lift Co. at £295 has been accepted for an electric lift at the Council's premises at 23 Belvedere Road, S.E.

Walsall.—The tender of the Underfeed Stoker Co. for a stoker at £267 is recommended for acceptance.

Amongst the numerous installations which have been recently carried out with "Stannos" wire, the following are worth mentioning:—Messrs. Baxter & Impey, Birmingham, have carried out the installation of a large country house at Knowle, Warwickshire. Messrs. J. H. Harpin & Co., Birmingham, have put in a complete installation of four Siemens motors with "Stannos" wiring for Richard Cooper & Sons, Atlas Works, Wolverhampton, and have also put in "Stannos" in country houses at Cobham, Surrey, and Burton Point, Cheshire. Messrs. E. D. Wishart, Southampton, are carrying out for Siemens Brothers the installation of a new theatre at Eastleigh, consisting of a 16-h.p. gas engine, "Stannos" wiring and "Zed" fuses. This firm are also carrying out the wiring of Summers & Payne's yacht-building yard, to the order of Siemens Brothers.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 10s. per ton (last week, £59 5s. to £59 10s.).

George Ellison (Birmingham).—From a recent visit to Mr. George Ellison's Birmingham works, we notice that this firm are particularly busy just now, and have some interesting contracts in hand, including one for 51 mining switch pattern panels with oil circuit breakers, interlocked with three-phase rotor starters, for a Liverpool distillery. They have also brought out a new "fool proof" form of three-phase starter for colliery work.

Buenos Aires Exhibition.—Messrs. A. Reyrolle & Co., Ltd., have been awarded a diploma of honour for their exhibit at the Railway & Land Transport Exhibition, Buenos Aires.

Extension of Works.—The Crypto Electrical Co. have found it necessary to again enlarge their factory in Bermondsey Street. The firm's numbers in Bermondsey Street, London, will be in future, 149, 155, 157, and 159.

APPOINTMENTS AND PERSONAL NOTES

Mr. F. B. O. Hawes has resigned his managing directorship of the Langdon Davies Motor Co., owing to the large increase of work in connection with the National Electrical Manufacturers' Association and other matters. He is now consulting engineer to the company.

Seventy-three applications for the post of Borough Electrical Engineer at Limerick have been received. The short list has been reduced to Messrs. White, Cloran, Martin, and Dowling.

An Electrical Supply Company in London require a junior draughtsman. (See an advertisement on another page.)

Model Specification for Street Lighting.—At the meeting of the Illuminating Engineering Society on Friday, Dr. Silvanus P. Thompson, F.R.S., the President, stated that the Council of the Society had decided to appoint a committee of its own members, with power to consult with others, to draw up in a preliminary form a model specification for street lighting. Their idea was to produce something which will serve, irrespective of any particular form of illumination, to show borough surveyors and architects the proper way to specify how streets should be lit.

Obituary.—We regret to record the death of Sir Charles Scotter, which took place on Tuesday evening at Kingston. Although chiefly conterned with the main line railways of the country, Sir Charles Scotter planned the Waterloo & City Railway, and was at one time Chairman of the Great Northern & City Railway Company. He also served on the Board of Trade Departmental Committee on the Ventilation of London underground railways.

We also regret to have to announce the death on Monday of Mr. R. G. Simpson, of the Great Western Railway Electrical Department. Mr. Simpson was a vice-president of the Batti-Wallahs' Society.

Rating of London Electricity Undertaking.—The Local Government Records and Museums Committee of the London County Council, in a report upon the rating of municipal electricity supply undertakings in London, calls attention to the under-assessment of the Marylebone undertaking. Originally this stood at £7,347, but at the recent quinquennial valuation, the figure was increased to £15,123. The L.C.C. are advised that a fair assessment would be £40,000 but the Assessment Committee have reduced the figure to £14,650. In view of the large difference between these figures the Local Government Committee recommend that an appeal should be made to Quarter Sessions. A difference has also arisen in regard to the St. Pancras undertaking, and an appeal is recommended in this case should the figure inserted in the list be considerably below that which the Council is advised is fair.

Central London Railway Staff Dinner.—The fourth staff dinner of the Central London Railway Co. was held on Saturday at the Holborn Restaurant. Mr. Granville C. Cuningham, general manager of the company, presided, and a large number of the staff were present, as well as some guests. Mr. Cuningham said that few railways had such a good record as regards smooth working. No serious accidents had occurred since the line opened ten years ago. This was not owing to chance, but was largely, if not wholly, due to the efficiency of the staff. The Secretary of the company, Mr. R. O. Graham, in replying to the toast of the Central London Railway, said that he hoped the extension to Liverpool Street, which would be open for traffic in about fifteen months' time, would mean largely increased dividends, and that they would be able to compete more successfully with the motor-'buses.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Eastern Telegraph Co.—Third quarterly dividend of 1¼ per cent. on the ordinary shares.

Johnson Lundell Electric Traction Co.—A loss of £1,731 is shown by the accounts for the 16 months to October 31st, 1910. The debit balance now stands at £97,136.

British Insulated & Helsby Cables.—The transfer books will be closed from December 17th to 31st inclusive.

India Rubber, Gutta Percha & Telegraph Works Co.—There was a net profit of £55,414 for the year to September 30th. The sum of £55,012 was brought forward and after meeting preference and interim dividends there is a balance available of £93,239. Special reserve is credited with £30,000, and after meeting a final dividend at the rate of 10 per cent. per annum, £22,614 are carried forward. The report contains the remark that "the electrical industry continues dull."

R. Waygood & Co.—Interim dividend at 2½ per cent. on the ordinary shares.

Cleveland & Durham Electric Power Co.—The scheme for reducing the capital of this company from £1,000,000 to £300,000 was sanctioned in the Chancery Division this week.

NEW COMPANIES

AMERICAN SURFACE CONTACT CO.—Capital $250,000. To acquire the American and Canadian rights of the S. P. Surface Contact Syndicate, Ltd., 18 Fenchurch Street, London, E.C.

CRYSTAL PALACE KEARNEY HIGH SPEED RAILWAY SYNDICATE, 100 Victoria Street, London, S.W. Capital £30,000. To deal with the Kearney high-speed system in the Crystal Palace grounds or elsewhere. Among the subscribers are H. W. Healy, electrical engineer, 4 Glebe Road, Barnes, and E. W. C. Kearney, 100 Victoria Street, London, S.W.

L.C.C. School of Engineering.—A conversazione was held by the Association of Electrical Engineering Students of the London County Council School of Engineering and Navigation, Poplar, on Saturday, December 3rd. Mr. H. A. Garratt received the visitors, and, in addition to a concert, several lecturettes were given, among them being one by Mr. J. Paley Yorke on "Colour and Electric Light."

SUMMARY

A DEMONSTRATION of the possibilities of up-to-date electric street lighting is being made in the City by the City of London Electric Lighting Co. Flame arc lamps on high central posts are used in Farringdon Street and centrally suspended flame arc lamps light Cheapside. The distribution is assisted in both cases by prismatic globes. A demonstration of metal filament lighting is being given in Paternoster Row. (Page 803.)

AN installation of street lighting by metal filament lamps has been arranged in Gower Street by the Metropolitan Electric Supply Co. (Page 806.)

AN important Paper on the new submarine telephone cable between England and France was read by Major O'Meara (Engineer-in-Chief to the Post Office) before the Institution of Electrical Engineers last Thursday. Major O'Meara explained the reasons for adopting coil loading rather than continuous loading, and for not employing paper as a dielectric; a description of the laying of the cable was included, and particulars of the subsequent tests. An excellent discussion followed: Dr. Fleming pointed to an error in predetermining the attenuation constant of continuously loaded cables by taking the permeability of the iron from the ordinary magnetisation curve, and advocated the comparison of the resistance of iron to high frequency currents with that of non-magnetic wire for ascertaining the permeability; Mr. Dieselhorst explained that repairs to the cable would be easy, and would not affect the result of the loading; Sir John Gavey mentioned the results obtained with continuously loaded cable made to his specification for the Buenos Aires telephones; Mr. Kempe explained that the question of continuous *v.* coil loading was really one of cost, and gave indications of useful experiments that were being carried out with a view to improving cables of the former class; Mr. Whalley said that the tests indicated that a large proportion of the losses in the cable were due to reflection at the ends; Mr. Siemens said that the majority of the repairs in the Channel cables were rendered necessary by fishermen's anchors; and Dr. Silvanus Thompson put in a plea for experiments with cables with inductive leaks. The discussion will be continued on January 12th. (Pages 807-810.)

MR. HAYDN T. HARRISON'S Paper on "Street Lighting" has been further discussed at Birmingham. (Page 810.)

IN the Chancery Division last week, Mr. Justice Swinfen Eady decided that the Newcastle Corporation are bound to take the supply of electrical energy for their tramways in Walker from the Newcastle-upon-Tyne Electric Supply Co. Walker now forms part of Newcastle, but before it was absorbed, the Company had purchased the Walker electric lighting Provisional Order, and were entitled under an agreement to supply all the electrical energy required in Walker. (Page 811.)

THE annual dinner of the Glasgow Local Section of the Institution of Electrical Engineers was held last week. (Page 811.)

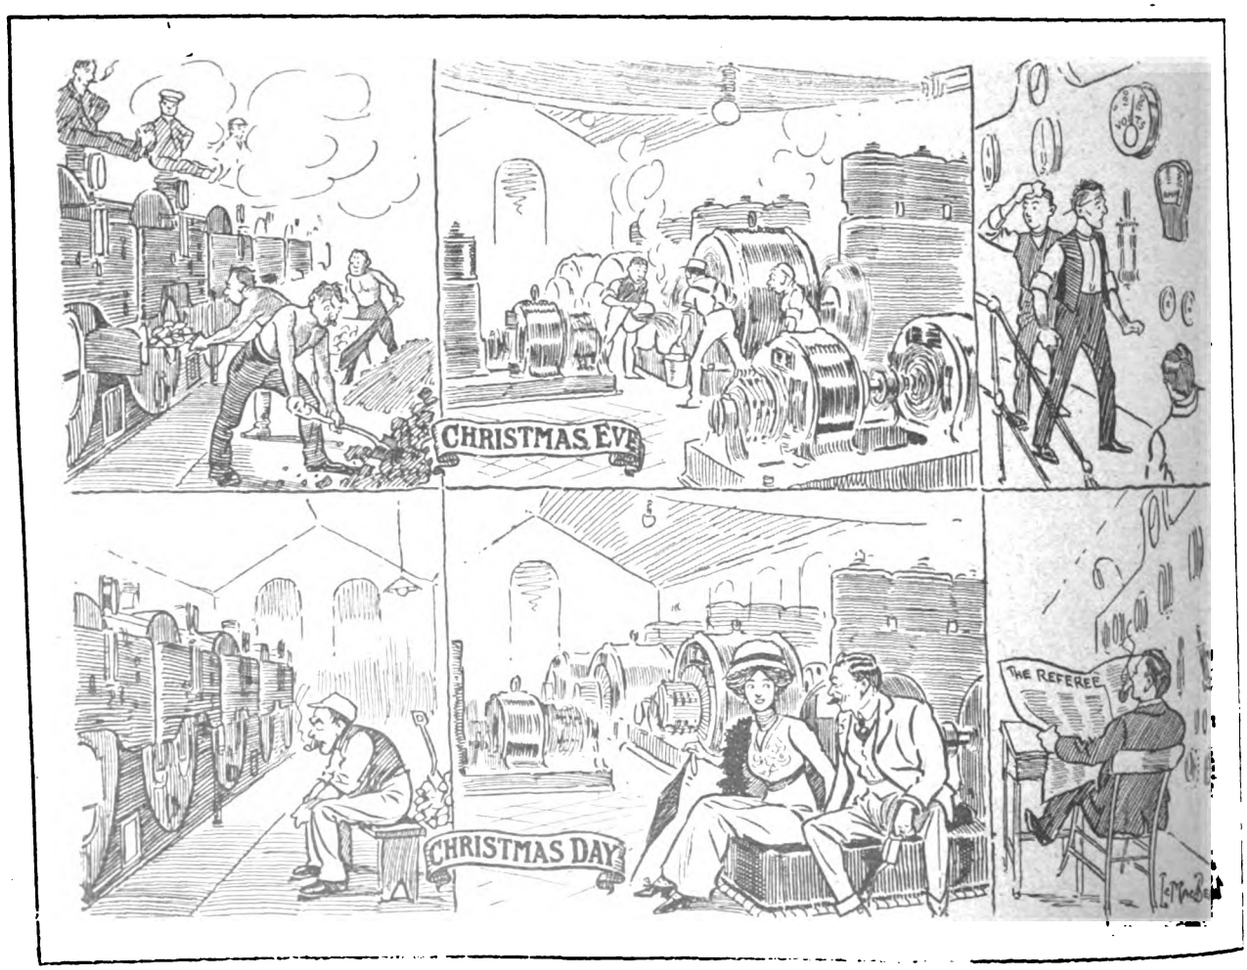
IN a report to the Limerick Corporation, Mr. A. V. Clayton recommends the scrapping of the present producer gas plant, engines, and battery, and the purchase of a new steam plant. (Page 811.)

A CORRESPONDENT writes to prevent confusion arising between two companies with somewhat similar names. (Page 811.)

AMONG the specifications published by the Patent Office on Thursday was one by Miles Walker for a method of automatically adjusting the strength of commutating poles. W. P. Orton describes a method of preventing chattering in A.C. electromagnets. A method of preventing explosions in oil switches by filling them entirely with oil is covered by Messrs. Siemens Bros. Dynamo Works. The opposition to the grant of a patent to R. C. Lyness for a replaceable contact finger for controllers has been unsuccessful. The British Thomson-Houston Co. wish to amend a 1904 patent covering a system of protecting transformers. (Page 812.)

THE hearing of the action by Marconi's Wireless

Digitized by Google



Telegraph Co. against the British Radio-Telegraph & Telephone Co. for alleged infringement of patents has been adjourned until after the vacation. During the last week, evidence has been given by experts for the Marconi Co. on the question of anticipation and on infringement with regard to the first of the three patents concerned. Mr. Terrell has opened the case for the defendants on both questions. (Page 814.)

THE Board of Trade have raised objections to the transfer of the Frome Electric Lighting Order to Messrs. Edmundsons'.—An appeal against the rating of the L.C.C. Greenwich power house is to be made.—The accounts of the Marylebone electricity undertaking for September quarter show an increased revenue of £2,482. The Sales Department shows a loss of £178.—The Scarborough Corporation are to proceed against the Tramways Company in the courts in respect of the winter service.—The Handsworth Council complain that the Birmingham Corporation are not proceeding with the electrification of the lines in this district.—Street lighting experiments are to be carried out in Lewisham by the County of London Electric Supply Co. and the South Metropolitan Gas Company.—Mr. James Swinburne has reported upon the reorganisation of the Leicester Electricity Department. (Page 815.)

EDINBURGH CORPORATION propose to take up a loan of £75,000; Harrogate, £2,500; Leyton, £7,000; and Southampton, £2,150. Additional sub-stations are to be erected at Brighton; extensions to mains, cooling tower, and public lighting are to be undertaken at Yarmouth; a telephone installation is required at the Homerton Infirmary; cable ducts by the London County Council; and a pumping plant at Salford. Tramway extensions are proposed at Ayr and Dundee; an electric lighting and tramway installation is required in Turkey, and an electrical installation by the Gateshead Union. The Australian Postmaster-General's Department invites tenders for telephone material. (Page 817.)

Yorkshire Local Section of the Institution of Electrical Engineers.—A reception was held by the Chairman of the Yorkshire Local Section, Mr. T. Harding Churton, followed by a smoking concert, at the Hotel Metropole, Leeds, on December 15th. There was a good attendance of members and their friends, and an excellent programme of vocal and instrumental music was greatly enjoyed. Mr. Kitchen's orchestra played, violin solos were contributed by Mr. Montagu-Nathan, while Messrs. R. Wilson, S. H. Smith, and W. E. Lang sang a number of songs.

Telegraphic Traffic and Movements of Cable Ships.—We may now every day expect to hear of the repair of the Puerto Plata—Cape Hayti cable of the Compagnie Française des Cables Télégraphiques, which has been down since the 23rd ult. The Paramaribo-Cayenne cable of the same company will then be taken in hand. It has been down since September 28th last, but of course the repairing ship was being overhauled at New York. Owing to an earthquake, four cables of the Eastern Telegraph Co. at Mozambique and Zanzibar have been broken. The line between Bagdad and Bassorah was down for a short while on 13th inst., otherwise there is nothing fresh to report. At the present moment there are three cable repairing ships in the West India Docks, the *Faraday*, the *Buccaneer*, and the *Mackay-Bennett*, of the Commercial Cable Co. The last-named is being overhauled and fitted with electric light and a new wireless installation. The *Contre Amiral Caubet*, of the French Telegraph Co., was recently engaged repairing the St. Pierre—Cape Cod section, and also the Brest—Cape Cod cable, but bad weather interfered with the work in connection with the latter cable. After completion she took more cable inboard at New York. The *Pouyer-Quertier*, of the same company, has completed her overhaul at New York, and is now in the West Indies. The cable steamer, *Mima*, of the Anglo-American Telegraph Co., was engaged in a repair of the Direct United States Co.'s cable to Harbour Grace, and also of the St. Pierre—Duxbury section. The Western Union Telegraph Co.'s ship *Robert C. Clowry*, returned to Halifax, N.S., after repairing one of the Canso—New York cables.

STREET LIGHTING IN THE CITY OF LONDON

IN the year 1878, when Mr. Bassingham and Colonel Haywood reported to the Streets Committee on the Jablochkoff lamps, installed in the Avenue de l'Opéra, Paris, by the Société Générale d'Electricité, the question of the lighting of the City of London assumed an interest which has continued ever since. There have been repeated demonstrations and disappointments, the latter ultimately turned to success by the persevering efforts of the various enterprising electrical companies, who from 1878 to the present time have spent much time and money in bringing public lighting to its present state of perfection.

The early lighting of Holborn Viaduct (November, 1878) by 16 Jablochkoff lamps, displacing 86 gas lamps, may be looked upon as the initial step in the substitution of electricity for gas; but, as is well known, this experiment was not a financial success. In 1880 the City Commissioners again decided to experiment, and Ludgate Hill, Cheapside, and King William Street were lighted by the Brush Co., the Electric Light & Power Generator Co., and Messrs. Siemens for one year, which ended in April, 1882. Further experiments by the Brush Co. followed, while the Ediswan Co. made a demonstration in Holborn Viaduct with 92 16-c.p. glow lamps installed in place of 86 14-c.p. batswing gas burners. Owing to the passing of the Electric Lighting Act of 1882, matters were held in abeyance while the Commissioners considered the position, but the Anglo-Brush Co. continued the arc lighting in Bridge Street, Ludgate Hill, &c., until the end of 1885.

The first practical electric lighting of the City streets on a large scale may, however, be said to date from the Brush Co.'s proposal of 1885, the conditions of which were practically those adopted by the Commissioners in 1889, the matter being continuously before them throughout the intervening five years, during which Sir William (then Mr.) W. H. Preece was consulted. After 13 years of deliberation and experimental trials, 1890–91 saw the Brush Co. and the Laing, Wharton & Down Co. obtaining Provisional Orders and definite contracts for lighting the main thoroughfares by arc lamps by the end of 1893. In February, 1891, the two companies concerned transferred their obligations to the City of London Pioneer Co., which in turn was absorbed, in July, 1891, by the present City of London Electric Lighting Co., who completed the contract for over 500 arc lamps in accordance with the recommendations of the Commissioners' advisers. Since the date of this instalment, the City of London Electric Lighting Co. has continued to take a most active interest in public lighting requirements, and for this purpose have equipped extensive test rooms at their Bankside Works for examining each new type of lamp brought out. It was not until about 1903, when the magazine flame arc became a commercial success, that it was found feasible to advocate any material change in the open arc lamps, which had so far proved satisfactory for the public lighting of the City. At this date defects still existed in connection with flame arcs, not the least being the question of carbon supplies and deterioration of the lamp due to fumes. The company, however, decided to apply these lamps practically, and in 1904 erected the flame arcs on the front of the Mansion House, these being followed early in 1905 by the erection of similar lamps in Poultry and Mansion House Place. The success of these lamps led to a further demonstration of flame lighting in October, 1905, at Blackfriars Bridge approach.

These demonstrations resulted in the City Co. obtaining a contract from the Corporation for lighting the Central Meat Market, Smithfield; the old open arcs being replaced by 10-amp. Oriflamme lamps in May, 1907. In this year the City Co. also asked for and obtained the permission of the Corporation to replace the old 10-amp. lamps in hexagon lanterns on the posts in Holborn by Oriflamme arcs with opalescent globes supported on swan-neck brackets. The instalment of these lamps was completed by November, 1907; and, notwithstanding the fact that the City Co. had provided all the new capital required, and had greatly improved the lighting of the street, they were able to reduce the annual charge per lamp from £26 to £17 10s. Further progress in the improved lighting of the streets was held over for a while pending the various experimental trials with high-pressure gas, but contracts were entered into for the electric lighting of Billingsgate Fish Market in January, 1908, and of Leadenhall Market in July, 1909.

Improvements which were made in flame arc lamps and flame carbons, and the advent of metallic filament lamps, which are exceptionally suitable for minor street lighting, rendered it possible for the City Co. to lay before the Corporation further offers to demonstrate more completely the possibility of improving the lighting of the City streets by electricity, and at the same time substantially reducing the cost thereof. After lengthy consideration, the Corporation allowed this work to proceed, and the following schemes were carried out and put in operation last month.

The lighting in question demonstrates three systems, viz., the central suspension system, central lighting by high standards, and the bracket system, which we shall treat in the order named.

Probably the chief merit of the central suspension system, which is employed in the Cheapside and Watling Street area, lies in the advantageous position, relative to cross streets, in which it enables lamps of high candle-power to be placed, at any desired height above the roadway, without blocking the traffic by centreposts. This part of the demonstration involves the use of the latest improved magazine flame arc lamps, in conjunction with a central suspension allowing the lamps to be lowered to the side walk for trimming in the main side streets, and courts enclosed within the area bounded by Cheapside, St. Paul's Churchyard, Watling Street, and Bow Lane. For this purpose, 10 flame arc lamps have been suspended over the centre of Cheapside, which is 60 ft. in width. Five of the lamps are opposite the junctions of side streets, and remain alight from sunset to sunrise, while the rest are extinguished at midnight.

Four flame arc lamps of the same type are suspended in a similar manner in Watling Street, the width of which varies from the junction of the cross streets, so that the latter are illuminated at one end by the Cheapside lamps and at the other by those in Watling Street. Watling Street has, in addition, two high candle-power lanterns containing metal filament lamps of 300 c.p., centrally suspended in the long intervals between the arcs. The lighting of the side streets, passages, and courts adjoining is augmented where necessary by 12 metal filament lamps of from 75–100 c.p., enclosed in fittings supported from side brackets of the same type as those described below for Paternoster Row. On the small traffic rest at the west end of Cheapside by Peel's Statue is a pilot standard having two 100-c.p. metallic filament lamps, supported in fittings attached to a double bracket top of a similar pattern to those described for Farringdon Street.

These 29 new lamps have displaced eight open arcs and 41 gas lamps. The total actual candle-power now obtained is more than double that of the old lamps displaced, while the annual cost of lighting shows a very material reduction. 1,897 ft. of main street are lighted by the 14 arc lamps, and the side streets, courts, and passages also partly lighted by these arcs, in combination with metallic filament lamps, amount to 2,475 ft., so that the total length of thoroughfare illuminated by the combined arrangement is 4,372 ft. The height of the centrally suspended lamps is 27 ft. 6 in. to the roadway, and that of the tungsten lamps on brackets in the minor streets and courts from 12–13 ft.

The arc lamps are the latest pattern of Messrs. Oliver's 12½-amp. magazine flame lamp, having special carborundum economisers and other recent improvements. They are fitted with the special prismatic reflector, designed by the City Co. and shown in Fig. 5. This consists of a funnel-shaped ribbed glass dish screwed to a movable tubular stem, supported by a special fitting attached to the bottom of the outer globe. These reflectors greatly increase the candle-power available near the horizontal plane; they also enlarge the visible area of the light source, and screen the eye from the direct rays of the arc at all angles 35° below the horizontal, permitting of the use of a clear glass outer globe, which in itself increases the efficiency by about 20 per cent. They also reduce the deposit on the globes, and all carbon ends and dust pass through the reflectors into a detachable copper ball fitting below the globes. An effective candle-power of 3,500 is obtained just below the horizontal plane, while the mean hemispherical candle-power is maintained above 2,800. The special carbons burnt in these lamps give but a slightly golden-tinted light, devoid of any excess of the yellow or red rays which are the cause of the somewhat glaring effect of many flame arc lamps, and of excellent fog-penetrating quality. The strong illumination of the building fronts assists greatly in the general effect.

The suspension gear was specially made by the London

Digitized by Google

Electric Firm (Croydon), after experiments, in conjunction wth the City Co., and embodies many ingenious devices.

The general view of the cross span wire arrangement is shown by Fig. 6. The central headpiece and weatherhood contains the electric contact device and automatic coupling, which holds the lamp when in position independently of the.

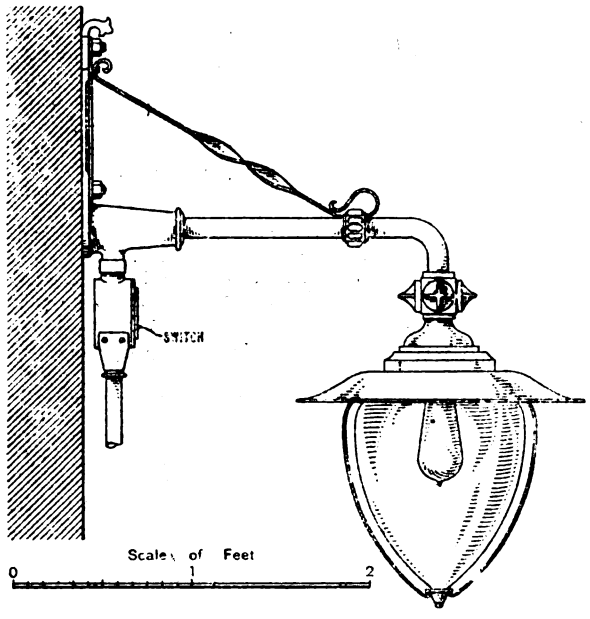

FIG. 1.—SPECIAL BRACKET FOR METAL FILAMENT LAMP IN PATERNOSTER ROW.

winch wires. This hood is rigidly attached to the two span wires crossing diagonally at the centre of the roadway. These main span wires (which consist of $\frac{5}{16}$ in. diameter compound steel ropes of the type used for aerial ropeway work), are secured at their ends to special rosettes on wrought-iron wall plates, held to the building frontage by two 1 in. diameter Lewis bolts cemented into the wall 11 in. apart. The lamp carriage, shown separately in Fig. 6, is made to traverse one of the main span wires by the operation of a winch-box containing two winding drums, one for supporting the carriage draw wire and the other the lamp-lowering wire. These drums may be worked separately or together by means of an interlocking gear, which is brought into action by pressing a button provided on the winch-box. It is thus possible to drop the lamp any convenient distance from the central hood and maintain its height above the ground level until drawn into the required position for lowering, which can be done at any desired point. The lamp and draw wires from the winch-box to the span-wire rosette are both protected by being enclosed in a 1 in. diameter Simplex steel tube, rendering it possible to keep the wires thoroughly coated with a suitable waterproofing lubricant. The electric leads, consisting of a twin cable, rise at the opposite side of the roadway, crossing to the central hood below the same span wire, to which it is attached by the usual hangers. An isolating switch-box is provided on this cable at a height of about 8 ft. from the ground, the automatic cutout-box being placed in a convenient position above the shop frontages. The whole of the cabling, from the ground to the span wire, is entirely enclosed in $1\frac{1}{4}$ in. diameter Simplex steel tubing.

The next system, central lighting by high standards, is adopted in Farringdon Street, and the central standards are placed on the roadway rests recently provided by the Corporation of the City of London. One of the designs of standards (supplied by Messrs. Macfarlane) is shown in Fig. 1. The base above ground is approximately 2 ft. square by $5\frac{1}{2}$ ft. high, surmounted by a circular column tapering from 8 in. diameter at the enlarged make-up on base to 5 in. diameter at the top. The footing consists of a rectangular root about 20 in. square, flanged at the bottom about 3 ft. below the base, the whole consisting of one casting, bolted down to *H* girders secured in a concrete foundation. Special provision had to be made for mounting the standard over the public lavatory at the south end of the street, above a large existing ventilating base. A suitable column of somewhat different design, having an inverted spigot to fit the ventliating base, and a 7 in. diameter steel tube extension for anchoring to the girders below was provided for the purpose.

The arc lamps installed are of the latest $12\frac{1}{2}$ amp. Excello flame type, fitted with inner dioptric deposit free globes within very slightly opalescent spherical outers. The candle-power distribution around these lamps is of a nature most suitable for street lighting, the candle-power near the horizontal exceeding 4,000. The height of the lamps above the roadway is 25 ft. 6 in., and the distance apart about 180 ft.

A novel feature is the central harp-carrier, which was designed and manufactured in the workshops of the City of London Co. Reference to Figs. 3 and 4 shows the general appearance and construction of these carriers. The top of the standard terminates in a spigot, over which is fitted the bell fitting forming the base part of an outer, fixed, fork-shaped, webbed casting, having at the top rectangular trunnion boxes. The inner harp-carrier is free to rotate between the carrier arms—within the limits provided by the draw wire and catch chains. At the apex of the harp is pivoted the weather-hood, within which is fitted the London Electric Firm's standard contact device and automatic locking gear. The lamp leads and winch wires are entirely confined within the forked casting and harp tubes.

The bases of the columns are provided with two doors, giving ready access to the lamp-isolating switch, automatic cutouts, and winch-boxes, all of which are conveniently fitted in the ample space at the base.

The space under Holborn Viaduct is illuminated by metal filament lamps, supported from the Viaduct girders by suitable lanterns and reflectors. Immediately below the centre of the Viaduct is a small traffic rest; there is a pilot standard having a double bracket, supporting two pendant lanterns, each containong a 50-c.p. metal filament lamp. This is represented by the initial letter of this article. Similar standards have been erected on the small rest between Fleet Lane and Seacoal Lane, and also at the Charterhouse Street end of the lavatory entrance at the north end of Farringdon Street, the candle-power of the lamps in the latter instance, however, being increased to 200 candles.

At the end of Snow Hill near its junction with Farringdon Street, and also at the rest at the south-east end of St. Bride's Street near Ludgate Circus, Oriflamme arc lamps on suitable bracket tops have been erected, attached to the old City posts, which were originally fitted with hexagonal lanterns, containing 10-amp. open arcs.

The total length of thoroughfare lighted is 2,162 ft.

For Paternoster Row, which is typical of the many narrow minor streets in the City having a roadway for a single line of traffic and a number of narrow courts and passages leading

therefrom, the bracket system has been employed. Eleven gas lamps have been replaced by nine 75-c.p. metal filament lamps in pear-shaped clear glass globes, with internal reflectors and external white enamelled shades (specially made for the City of London Electric Lighting Co. by Mr. Haydn Harrison), the combination giving an actual effective candle-powder of 95 candles per lantern. One of the brackets is illustrated in Fig. 1. Other designs are used in special situations.

The height of the lamps is from 12 ft. 6 in. to 14 ft. 0 in. above the footway.

The increase in effective candle-power and improved disposition of the lamps in the street, has enabled the Corporation to dispense with several lamps in side courts, the result being that 15 gas lamps have been extinguished on account of the nine new electric lamps installed, and a very material saving in the cost of lighting of this street has been obtained.

Having now given a general description of the new lamps

Some idea of the improvement effected in the street lighting by the instalment of these fittings is shown by the accompanying table. The whole of the cost of this instalment has been borne by the City Co. with the object of actually proving the great advances effected in electric lamps in recent years.

EXPERIMENTAL LIGHTING IN HOLBORN

We have already detailed (Electrical Engineering, December 8th, page 772) some of the circumstances which led to the comparative demonstrations of electric and gas street lighting which are now being made in different parts of Gower Street, in accordance with a specification of the Borough Surveyor of Holborn. The installation is now complete, and an excellent object lesson in up-to-date lighting by metal filament lamps is afforded.

The electric lighting of the southern portion of Gower Street has been carried out by the Metropolitan Electric Supply Co., who have powers of supply over the whole borough in conjunction with the County of London Electric Supply Co. and the Charing Cross, West End & City Electricity Supply Co., both of which companies have also powers in portions of the area. The demonstration involves eight new lamp standards, of which six carry a single lantern, each

Fig. 1.—Single Lantern Posts in Gower Street.

Fig. 2.—Special Double Lantern Post at Corners.

containing a group of four metal filament lamps in a clear glass globe, with a white reflector, giving an aggregate candle-power evidently well over that called for in the specification, and probably amounting to some 400 to 500 c.p. These lanterns were designed by Mr. Haydn T. Harrison. They are placed on the curb on both sides of the road alternately, and are 60 ft. apart. Fig. 1 shows their general arrangement. The remaining two standards, at the corners of Bedford Square and Montague Place respectively, are of a special pattern, shown in Fig. 2, with two lanterns hanging from separate arms. Each lantern contains a single lamp within a crinkled glass globe, and was made by the General Electric Co. to the designs of Mr. H. S. Highfield, Chief Engineer to the Metropolitan Electrical Supply Co., Ltd. All the new standards are 18 ft. in height. This height was considered more suitable than that of the lower gas standards replaced for giving the best effect, as regards light distribution, with units of the candle-power adopted, and is much to be preferred from the point of view of drivers of vehicles, as it raises the position of the light well out of their line of vision. Actual results of illumination tests are not at the present time available, but the lamps have only to be seen alight for the excellence of their illumination, and their suitability to their purpose to be appreciated. The evenness of the illumination is particularly noticeable.

LONG-DISTANCE SUBMARINE TELEPHONE CABLES

At the Institution of Electrical Engineers last Thursday, Major W. A. J. O'Meara, Engineer-in-Chief of the Post Office, read a valuable Paper on the subject of "loaded" cables for long-distance submarine telephony. By his courtesy we were enabled to publish a description of the new "loaded" telephone cable between England and France last March (Electrical Engineering, March 17th, 1910, p. 179), after its manufacture had been completed, and favourable weather for laying was being waited for. This cable is made up of gutta percha insulated core, with loading coils at intervals, and (after an interesting historical sketch and descriptions of the previous submarine telephone cables laid by the Post Office) Major O'Meara explained his reason for adopting gutta percha insulation without paper. The hygroscopic properties of paper cause it to absorb moisture from the gutta percha, and, therefore, neither of the suggested cables in which it was proposed to utilise layers of paper between the copper and the gutta percha were adopted. An effort is being made, however, to discover some effective means of overcoming the practical difficulties which have been encountered, owing to the moisture exuding from the gutta percha.

The "continuously" loaded type of cable would have offered the advantage of being mechanically simpler than the "coil loaded" cable, but investigation showed that the increase in efficiency which it was desired to obtain could only be realised at an incommensurate cost. Moreover, it was found that it was not possible to predict with sufficient accuracy, by mathematical calculation, the results likely to be obtained by the continuous loading, owing to the difficulty in attaching correct values to the electrical constants involved. In theory, the designing of a cable of this type seems to require merely the solution of the apparently simple problem of ascertaining the increase of inductance which can be obtained by providing layers of iron wire or tape of known permeability over copper conductors of known diameter, assuming that the nature of the dielectric to be employed has been determined, and that the overall diameter of the finished cable shall remain a fixed dimension. Although such a method of applying the iron would give the greatest possible inductance, either for a given outer diameter of the iron covering or for a given weight, yet Major O'Meara explained that it cannot be adopted owing to the excessively large increase of effective resistance which will accompany the increase of inductance, for at high frequencies the eddy-current loss in such an iron sheath would be impracticably large. Hence the iron covering must be electrically divided, not continuous.

Investigations by the Post Office engineers indicated that it was possible to obtain more appreciable improvements by employing loading coils. It was known that a lead-covered paper-insulated cable provided with loading coils had been laid across Lake Constance from Friedrichshafen to Romanshorn; but in view of the difficulties which would have arisen in the event of the lead sheathing being punctured, it was deemed that it would have been a costly and hazardous experiment to lay a cable of this class across the English Channel.

Whilst investigations were in progress, an article appeared in the *Elektrotechnische Zeitschrift* (vol. 29, 1908, p. 588), in which doubt was thrown on the possibility of improving transmission in gutta percha covered cables by means of the so-called Pupin coils, on account of the low effective insulation of gutta percha to currents of high frequency. In order to settle the point definitely, some experiments were carried out by the Department on No. 7 gutta percha covered wire (weight of copper, 40 lbs. per mile; of gutta percha, 50 lbs. per mile), having a number of inductance coils inserted at intervals. It was found that the actual improvement in transmission was in complete agreement with the estimates based on the calculations that had been made, and that commercial speech was practicable on 105 miles of this particular type of coil-loaded gutta percha wire. The question of providing a non-uniform loaded type of cable was therefore proceeded with.

In order to be absolutely on the safe side, however, when preparing the specifications for this new Anglo-French cable, it was decided that the general design of the new telephone cable in respect of the copper and the dielectric should be exactly similar to the type already in use, which it was known would provide telephonic transmission of a certain quality, and that the improvement desired might be obtained by the contractors either by means of continuous loading or coil loading, the Department simply stipulating in the specification that the attenuation constant should not exceed a certain definite value. The main reason for this was that if it had been discovered after the cable had been laid that coils introduced effects not foreseen, the coils could easily have been cut out at a small cost, and the Department would still have had a cable as good as the existing one. Under certain conditions of design in the relation of the weight of gutta percha to that of copper, an effect is created referred to colloquially as "drumminess," which causes speech to be muffled. In an unloaded circuit "drumminess" is generally unmistakable, when the ratio K/R per mile is equal to 0·003. Selected firms were asked to tender. No tenders were received for the "continuous" type of loading, but three tenders were received for the "coil" type of loading. Messrs. Siemens Bros. & Co.'s tender was accepted. A detailed and illustrated description of the cable, the loading coils, and the method of armouring appeared, as as been already stated, in Electrical Engineering of March 17th, 1910. The coils are inserted at intervals of 1 naut (1·153 miles); the two coils nearest the ends are half a naut from the terminal apparatus, as experiments have shown that in this arrangement reflection losses are considerably reduced. Each coil is protected with a sheet of metal foil in order to exclude all possibility of the silk covering of the wires of the coils absorbing moisture

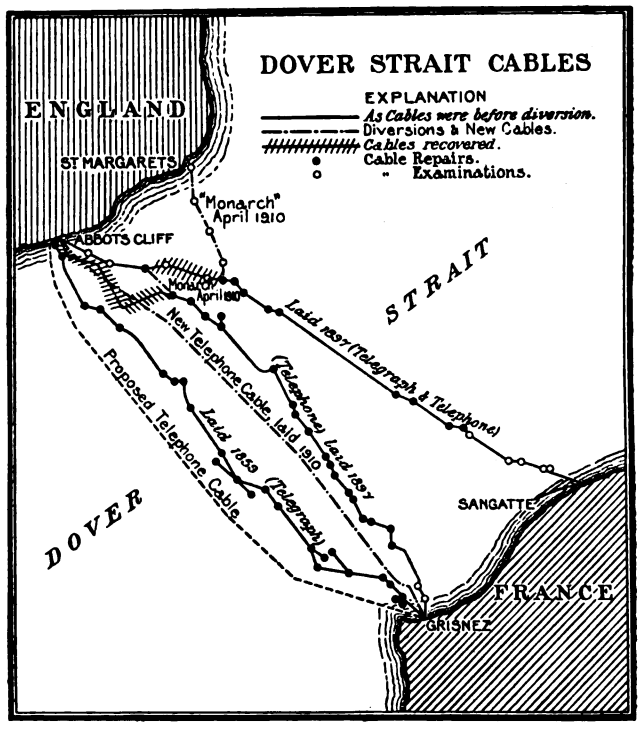

Fig. 1.—Map showing Routes of Cables, and Positions of Repairs and Diversions.

from the cylindrical envelope of gutta percha in which they are contained. The result of tests indicated that the attenuation constant of the loaded cable was 0·0147 per mile.

Major O'Meara then referred to an important point in connection with the maintenance of the cable. In repairing cables, intermediate lengths have to be inserted at times, but fortunately if repairs of this character have to be effected in the coil-loaded cable, no noticeable impairment in the quality of the speech will result if the coil spacing is disturbed to an extent not exceeding 5 per cent. on either side of the best location from the theoretical point of view. It has been found that when physical conditions impose a variation of not more than 50 per cent. of the spacing for a single coil, no appreciable impairment in the quality of the speech will result provided the deficiency in loading is made up within the next ten loading sections. The frequency with which repairs have been carried out on the existing telephone cables, as shown in Fig. 1, will convey some idea of the importance of this matter.

Mr. W. Dieselhorst was entrusted by Siemens Bros. & Co.

Digitized by Google

with the actual operation of laying the cable, and the cable ship *Faraday* was employed for the purpose. As a precautionary measure, the ordinary paying-out drum had been replaced by one of larger diameter, and fleeting-knives were also provided in order to prevent the cable from over-riding.

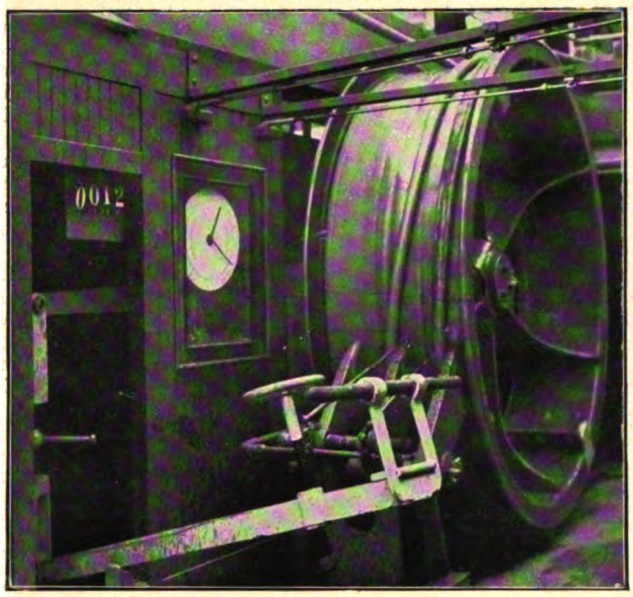

FIG. 2.—C.S. *Faraday's* PAYING-OUT DRUM WITH FLEETING-KNIVES.

The new drum was 8 ft. in diameter, and 30 in. wide, and three fleeting-knives were fitted side by side to this rather wide drum to prevent any undue pressure on the loading coils, which would be caused if two turns on the drum were fleeted by one knife only (Fig. 2). It was further decided to pay the cable out without passing it under the dynamometer wheel as is usually the case where deep-water cables are concerned. All bends were avoided by letting the lead from the tank go on to the upper part of the drum, and an open wood trough was fixed from the cable tank to the drum to support and protect the cable between these points. Since the upper part of the drum is nearly in line with the stern sheave there was no extra bending of the cable over any intermediate supporting sheaves after it had left the drum. The stern sheave on board the *Faraday*, which has a diameter of 4 ft., can be swung out at will to any angle, and this was found to be exceedingly serviceable when turning the ship round at right angles near Abbot's Cliff, and again when the French coast was reached.

The cable was paid into the *Faraday's* tank on the 2nd and 3rd of May, 1910, and the ship left Woolwich on the 4th with the official representative of the Post Office on board. A large party of gentlemen—from this country and Germany—especially interested in telephone enterprise embarked on the *Faraday* as guests of Messrs. Siemens. The day being fairly clear and the sea smooth, the laying of the cable went off without a hitch, but a brisk wind sprang up late in the afternoon, and the *Faraday* had a somewhat rough passage back. The English Channel is becoming very congested as regards cable routes (see Fig. 1), and to assist the *Faraday* in keeping her course, buoys had been placed at intervals by H.M.T.S. *Monarch*, the positions of which were recorded on a chart supplied to the contractors. Fig. 1 shows some recent alterations in the routes of old cables to avoid the laying of the new cable over old ones. Operations were commenced at 5 a.m. on May 5, 1910, by dropping a buoy, to which the shore end was attached, overboard about half a mile from the South Eastern Railway Company's retaining wall south of the tunnel works. For some distance the cable was laid parallel to the British coast, until a point was reached opposite the landing-point, when the ship's bow was turned towards the French coast. It was not possible for the *Faraday* to approach nearer than 1½ miles to the French landing-place, as the coast shelves out very gradually. Therefore, when the ship was about that distance from the coast, the course was altered, and the remaining portion of cable paid overboard approximately parallel to the coast.

The landing of the shore ends was commenced at 5 a.m. on May 18th, 1910, by Mr. F. Pollard, Submarine Superintendent; H.M.T.S. *Alert* was employed. The shore end on the English coast was first picked up, and the cable coiled into the ship's forward tank. The *Alert* then steamed in as close to the shore as her draught would allow, and anchored. A raft was made, and the shore end paid out on to it. The raft was then towed ashore by means of a warp rope, the cable being paid out into the water. This work was completed at 11 a.m., and the *Alert* at once proceeded to the French coast, where the section of cable parallel to the coast was picked up. When the tide permitted, the ship steamed in towards the French shore, paying out the cable. A short length provided in excess of the actual length required to reach the shore was cut off, and the remainder of the cable was paid

FIG. 3.—EASING A LOADING COIL OVER THE SHEAVES.

Digitized by Google

overboard at a distance of about 350 yards from the cable hut. When the tide receded up to this point the end was carried to the cable hut.

Since the bow sheaves of the *Alert* are only 2½ ft. in diameter, the loading coil sections were not allowed to ride on the bow sheaves, but tackle was fixed to a derrick, and the coils were carefully lifted over the sheaves (see Fig. 8, p. 808). However, in the case of the coils in the section of the cable in excess of that required for present needs, the opportunity was seized to ascertain whether the coils would be injured if allowed to pass over the *Alert's* sheaves in the absence of the precautions referred to. This portion of the cable, therefore, was hauled aboard in the usual manner, and a speech test was then made; no injury was disclosed in the test.

The cable has been under continuous observation since it was laid, and a large number of tests have been carried out. From the details of these, given in an appendix to the Paper, it appears that the value of βl (where β is the attenuation constant per naut and l the length of the loop in nauts) varied from about 0·6 at a frequency of about 750 periods per sec. to 1·33 at 1,720 periods per sec. The graph depicting these results gives a value of 0·63 for βl at the frequency of 800, which is considered to represent that of the voice in applying such tests as these. This works out to 0·0158 per naut, as the length of the loop was 40 nauts, and the value of β deduced from speech tests was 0·0169. The speech tests consisted of inserting lengths of "standard cable" in series first with the old cable, and then with the new cable until the limit of satisfactory audibility was reached in each case. Four observers, Messrs. W. R. Cooper, W. Duddell, F.R.S., W. Judd, and J. E. Kingsbury, made the test with the two pairs of the cable looped at the French end, and the English ends connected to two telephone sets, and the mean gain by the use of the new cable was found to be 17 miles of "standard cable" * for the standard of audibility accepted as commercial by the four observers named.

The employment of unloaded 800-lb. copper aerial conductors, such as are in use for the most important long-distance trunk circuits in this country, will render it possible for very satisfactory conversations to take place from call-boxes between centres in England and on the Continent when the added distances from the ends of the cable do not exceed 1,700 miles; that is to say, with land-lines of this description well-maintained conversations between London and Astrakhan on the Caspian Sea would be possible.

In his concluding remarks, Major O'Meara referred briefly to the work that is being done in similar directions in other countries. Mr. J. J. Carty, of the American Telegraph and Telephone Company, is engaged in solving the problem of putting the towns of the East Coast and West Coast of the United States into communication, and stated recently, at Paris, that he hoped to establish satisfactory communication between New York and Denver (distance, 1,700 miles) during the autumn of this year. Experimental investigations are being carried out by, amongst others, M. Devaux-Charbonnel in France, Drs. Breisig and Ebeling in Germany, M. Bela Gati in Hungary, and in this country in our midst Mr. Gill, Engineer-in-Chief of the National Telephone Co., is vying with Mr. H. R. Kempe, the Electrician to the General Post Office, both working in conjunction with their able staffs. Major O'Meara urged that a means should be found by which the scientific and practical results obtained by the investigators in these widely separated centres shall be in such a form as to be easily comparable. Although it has been agreed to abandon standards of commerce and to adopt those of the laboratory to record values affecting the efficiency of telephone circuits, the final results, he thinks, must be measured from the point of view of the non-scientific user; it is not possible to deal with telephonic transmission from the consideration of the attenuation constant in its mathematical aspect alone, but it is necessary to take into consideration its practical aspect as affecting audition. In the early part of September, 1910, he took part in experiments at Paris arranged by Dr. Breisig and M. Devaux-Charbonnel, which consisted in talking over actual telephone circuits, into which, in turn, artificial cables were introduced of three different types designed to reproduce conditions representing aerial wires, unloaded cables, and loaded cables respectively. The talking circuits were so arranged that in each case the total attenuation was by mathematical calculation exactly the same. Yet the quality and volume in audition under the three different cases were by no means in agreement. For comparative purposes, it is desirable, therefore, that not only should the conditions with regard to the circuit arrangements, including terminal conditions, be identical, but that all those who are engaged in this important investigation should employ, in connection with their experiments for measuring audition, apparatus manufactured to the same specification and compared with an international standard. He hopes that this result may have been attained as a consequence of the recent International Conference at Paris.

* Standard cable is that having a wire-to-wire capacity for each pair of wires of 0·054 microfarads per statute mile, a loop resistance of 88 ohms per statute mile, and an average insulation resistance of not less than 200 megohms per statute mile wire-to-wire.

There are no less than sixteen appendices to the Paper, all containing information of value. Two of these give particulars of other types of submarine telephone cables proposed, another two compare the cost of some of these, both per naut and for equal values of the attenuation constant, and particulars of some "continuously loaded" foreign cables are tabulated. Methods of calculating attenuation are explained, details of the tests we have already quoted are given, and the full specification to which the new cable was supplied is published.

DISCUSSION.

Dr. J. A. FLEMING, F.R.S., said that a great share of the credit must be given to Professor Pupin, who had shown that if they had a loaded cable and applied a wave of potential which occupied a certain distance, and called that 2π, and if the interval between the loading coils were expressed as an angle θ, the difference between a loaded cable and the corresponding cable with distributed inductance was represented by the difference between $\sin \frac{1}{2}\theta$ and $\frac{1}{2}\theta$. The Anglo-French cable practically complied with this law. At the frequency of 750, the wave length was about 12 nauts; as the coils were one naut apart, θ was 30°, and the difference between sin 15° and 15° (*i.e.*, $\pi/12$) was not much more than 1 per cent. The same law was followed by the cable originally suggested by Dr. Silvanus P. Thompson. Dr. Fleming also explained on the blackboard why the low effective insulation resistance of gutta percha gave no deleterious results, even if it was really a true conduction current. The difficulty in predetermining the attenuation constant of continuously loaded cables arose, he thought, from the difficulty of predetermining the permeability of the iron for these low magnetising forces. He had recently been carrying out some experiments on that very point, and had found that a very simple and effective way of determining the permeability was to measure the high frequency resistance of the wire, and compare it with that of non-magnetic wire. He found that this gave a permeability much lower, and consequently an attenuation constant higher, than was given by the ordinary magnetisation curves, so that cables designed on the latter basis would have in practice a larger attenuation constant than had been expected.

Mr. W. DIESELHORST (Siemens Bros. and Co.) said that, in his opinion, it would be as easy to repair cables with Pupin coils as ordinary submarine cables. Another point in connection with this cable was that there were more coils than were necessitated by the Pupin law, and, therefore, the shifting of coils during repair would not influence β.

Sir JOHN GAVEY, C.B., thought that continuous loading might be advantageously employed in connection with the trunk lines connecting submarine cables with the great centres of commerce. Owing to overhead tramways necessitating the employment of heat coils and fuses, the effective resistance of the heavy conductors erected by the Post Office (the weight of copper in which had been adversely criticised) had been increased by something like 20 per cent. Moreover, there was a feeling against the use of overhead wires in large towns. In connection with an undertaking that he had to deal with in Buenos Aires it had occurred to him that they could introduce underground cables with continuous loading. In such cables he thought it a mistake to employ two or three layers of fine wire, as it increased the cost, wasted space, increased the electrostatic capacity, and, further, the wire was hardened in laying it on the conductor. This was, no doubt, one of the factors which prevented the application of the ordinary formula in determining the value of β. He had, therefore, prepared a specification for an air-space paper insulated cable, the conductor to be 100 lbs. copper wire, to be lapped with a soft iron tape 1/100th inch thickness and 1/10th inch wide, the compound conductor to be thoroughly annealed, then coated with a hard varnish and insulated in the ordinary way. On the first section tested they got a conductor with a self-induction L=10; the effective resistance was 20·2 ohms per mile loop; and the calculated value of β was 0·024. This indicated an improvement of 70 per cent. on the ordinary unloaded cable. The actual results of the speaking tests showed an improvement of 77 per cent. In the second lot of cable they got a capacity of 0·059; self-induction 17, the effective resistance of the conductor when laid 22·4 ohms per mile, and the value of β was reduced to 0·0207, and one mile of the cable was equivalent to 4·97 miles of ordinary standard cable. This gave an improvement of 103 per cent. The speaking tests on the whole cable gave an improvement of 94 per cent.

Mr. H. R. KEMPE (Electrician to the Post Office) said that not many years ago he held the opinion that the use of loading coils would not be very effective, but he had since had to

Digitized by Google

modify that opinion considerably. On the question of durability of this type of cable, he had had it under continuous observation, and when he last tested it the results were just as perfect as when it was laid; there was not the slightest doubt that it would last as long as any ordinary cable. Incidentally, Mr. Kempe also mentioned the enormous drop of effective dielectric resistance which he had found to occur with alternating currents of very high frequency. Continuous loading was purely a question of finance. It was possible to obtain the required value of β without loading, if they made the conductor big enough, and the dielectric thick enough. Of course, they would get drumminess, but with continuously loaded cables this was got rid of because it was caused by the absence of self-induction. The best result so far obtained for continuous loading was about 70 per cent., but possibly a further investigation would show that the efficiency would be greater by continuous loading than with loading coils. Any experimental evidence which could be obtained in order to reduce the size of loading coils would be of very great value. The Post Office at present were engaged in making an extensive series of experiments in order to determine the permeability of iron and the conditions under which continuous loading could be obtained in the most simple and economical manner. Drumminess was largely a question of opinion. When the first cable was laid across the Channel unloaded, the public were entirely satisfied with the quality of the speech, but when they used the loaded cable there was no doubt they would say that it was very much better.

Mr. A. W. WHALLEY asked when the new cable to be laid by the French Government would be completed, and what type of cable would be used. He also raised the question whether the relatively thin insulation on the two wires involved in the use of loading coils would necessitate special protection against lightning. His chief point on the Paper was the value of β. There were, he said, five different values given in the Paper; both the highest and lowest appeared to be for speech values, but differed by 14 per cent. It seemed desirable when declaring the value of β, to make it clear how far frequency affected it, and whether terminal losses were included or allowed for. The speech test made by the four gentlemen who went to Dover gave results varying so widely that he hoped that the alternator method for reliable frequency control, mentioned in the Post Office Institution Journal this year, would be developed to produce a composite wave representing a fair average speech wave. Mr. Whalley also referred to some discrepancies in the published figures relating to continuously loaded cables, and in conclusion adduced some figures from the Paper, which, he contended, showed that 43½ per cent. of the losses in the new cable represented terminal loss due to reflection. Finally, he suggested the use of Mr. Kempe's name as representing one of the new electrical terms.

Mr. ALEXANDER SIEMENS said that fishermen's anchors were responsible for most of the repairs which had been rendered necessary in the cables. He also pointed out that the lengths had been spoken of in the Paper as knots, instead of nauts. A knot, he said, was a nautical mile per hour, and length should be referred to as naut. [We have, in accordance with our usual custom, employed the unit naut—representing 2,029 yards—in our report of the Paper and discussion.]

Dr. SILVANUS P. THOMPSON, F.R.S., pointed to the inaccuracy which beset mathematical calculations owing to the necessity of assuming a definite frequency; if they had a cable which was perfectly compensated for one particular note, then that note, when they talked through the cable, would sound greater than anything else, so that it was evident they could only get at an average result at the best. Therefore, experiments would have to play a great part. Referring to the use of inductive shunts across the cable at intervals which he had proposed in 1891, he said that this had not yet received the same grateful attention from His Majesty's Government, or from any other authority, as had the rival method of putting in inductance coils in series. Professor Fleming had been good enough to point out that the mathematical theory was the same for both so far as the distribution was concerned, but the problem was really a very different one. He had not arrived at his method by anything that he read in Heaviside, because that would have led him in another direction. In 1874 in the *Journal* of the Society of Telegraph Engineers, Winter described the use of inductive resistances as shunts at the ends of the cable, as previously suggested by Varley. If an inductive shunt placed across the ends of the cable would improve the action, why would they not when placed anywhere else. He was led to think it was good in telephony because of a communication by Sir William Preece in 1891, in connection with the London-Paris telephone cable, where it was stated that with a metallic circuit the talking from London to Paris was in no way interfered with when telephonic receivers were bridged across the circuit at the two ends of the cables; in fact, they rather improved the working of the line. He suggested in 1891 that for telegraphic signalling, one should be placed, say, every 500 miles or 100 miles, and perhaps for telephonic signalling, every 10 or 20 miles. If they wanted to make an Atlantic cable speak easily 300 words a minute, they would require one such inductive shunt across every 360 nauts, or only five in all, or seven with one at each end. If they wanted to get it to 1,000 words they would have to put one every 110 nautical miles. He pleaded for his particular solution being given a trial.

The PRESIDENT (Mr. S. Z. de Ferranti) announced that, owing to the large number of speakers wishing to take part in the discussion, it would be adjourned until January 12th, 1911.

STREET LIGHTING

AT a meeting of the Birmingham section of the Institution of Electrical Engineers on the 14th inst., a discussion was held on Mr. Haydn T. Harrison's Paper on street lighting, which has already been read and discussed in London and Manchester (see ELECTRICAL ENGINEERING, December 1st, page 763).

Mr. MAURICE SOLOMON (General Electric Co.) opened the discussion. He wished to know what was the shape of the special reflectors used by the author for incandescent lamps, and suggested that lamp globes should be standardised. He considered that the only comparison of candle power of value was the mean spherical, and wished to know if the costs per annum in the Paper were worked out on the candle-power of the rays from 10° to 16°.

M. R. A. CHATTOCK (City Electrical Engineer) asked if the author's figures as to candle power, etc., were obtained from independent and reliable sources; also, were the figures of 30–34 c.p. per cubic foot of gas obtained with new mantles? He agreed that 1d. per unit was a satisfactory figure to charge for street lighting, but he did not consider a street lighting load of more value than a motor load, although the load factor were the same. Tungsten lamps with suitable reflectors would solve the lighting of side streets. Mr. Chattock also held that the Local Government Board should not refuse to grant loans for street lighting.

Dr. W. E. SUMPNER (Municipal Technical School) considered the most important point in the Paper to be the improvement which can be effected by the proper distribution of the light and of the increase in the area of the source of the light which has been achieved lately. Horizontal illumination is required for street lighting, and vertical, downwards, for lighting interiors, but hitherto arc lamps, which have naturally a vertical illumination, have been used for street lighting, and glow lamps for interiors; this can be corrected by the use of suitable globes and reflectors. He held that the unit of measurement should be mean spherical candle-power.

Mr. ANGOLD (G.E. Co.) made some remarks with respect to the peculiarities and efficiencies of various types of arc lamps.

Mr. H. T. HARRISON, in reply, said that the measurement of spherical candle-power was of no use. The rating of candle-power should be at the angle at which the light is required, i.e., 10° to 15° from the horizontal. The reflectors were first designed on theoretical lines, but this was found to be not entirely satisfactory, as they only gave an increase in the light where it was required of 50 per cent., whereas a modified design of which the chord of the curve was 45° increased the light 2½ times. The reflectors were made of enamelled zinc, and he had found that a difference in the illumination was caused by so slight a matter as the graining of the enamel, and that therefore a dead smooth surface was desirable.

Annual Exhibition of the Physical Society.—At the exhibition held by the Physical Society at the Imperial College of Science and Technology last Tuesday, a quantity of representative apparatus was brought together, and the interest was much enhanced by the discourses given in the afternoon and evening by Prof. J. A. Fleming, F.R.S., on recent improvements in transmitters and receivers for wireless telegraphy and the cinematograph demonstrations with Mr. R. W. Paul's apparatus of moving diagrams of lines of force by Prof. S. P. Thompson, F.R.S. Among the exhibits much interest centred round the rotary multiple spark-gap discharger, shown by the British Radiotelegraph and Telephone Co., Ltd., and the demonstration of a new "valve" receiver by the Marconi Co. Most of the well-known instrument makers were represented. Electric portable and testing instruments were shown by Crompton & Co., Nalder Brothers & Thompson, R. W. Paul, the Weston Electrical Instrument Co., and Everett, Edgecumbe & Co., who also made a fine display of photometric apparatus including a new pocket "luxometer," an illumination photometer on the Trotter principle, weighing less than 1 lb. They also showed Mr. A. W. Pott's pattern of leakage indicator for tramcars, which gives an audible signal should the trolley standard become alive. Messrs. Evershed & Vignoles showed their "dionic" water tester (see ELECTRICAL ENGINEERING, November 17th, page 735), and the new Bleeck-Love 2·7 volt primary cell, for which great capacity and constancy is claimed, was among the exhibits of the India Rubber, Gutta Percha, & Telegraph Works Co., Ltd. The time-element circuit breakers of Morris & Lister may also be mentioned, also the electro-magnetic rectifier of Muirhead & Co., for which 96 per cent. conversion efficiency is claimed. A number of Dr. C. V. Drysdale's instruments were shown by Messrs. H. Tinsley & Co., and Messrs. Wright & Co., demonstrated Prof. E. & W. H. Wilson's new high frequency apparatus (see ELECTRICAL ENGINEERING, November 17th, page 732).

THE NEWCASTLE-WALKER TRAMWAYS: AN INTERESTING DECISION

AN interesting dispute between the Newcastle-upon-Tyne Electric Supply Co. and the Newcastle Corporation, with regard to the supply of electrical energy to the Walker tram ways, was heard before Mr. Justice Swinfen Eady in the Chancery Division on Friday and Saturday. Mr. C. A. Russell, K.C., and Mr. A. B. Shaw represented the Company, and Mr. Freeman, K.C., Mr. Macnaughton, K.C., and Mr. Sargeant were for the Corporation.

The question between the parties was whether the Corporation were under contract to take from the Company the electrical energy necessary for working the tramways in Walker (which has now become a part of Newcastle).

The Walker Urban District Council obtained a Provisional Electric Lighting Order in 1900, but leased it to the Company for 10 years, expiring on August 6th, 1910. In March, 1902, the Newcastle Corporation promoted a tramway in Walker, and, under the terms of the lease of the Walker Electric Lighting Order, were compelled to take the supply of energy from the Company. The leasing agreement also provided that at the end of the 10 years the Corporation was to take their supply from the Walker Council "or their contractors," and that no other authority should be allowed to supply electrical energy in Walker without the consent of the Walker Council. In March, 1903, the Company decided to improve its position, and, instead of merely holding the Walker Provisional Order under lease, decided to purchase it from the Council, and the Court held that in this way they became the Council's "contractors" as laid down in the agreement of 1902. A few years later, the Newcastle boundaries were extended to include Walker, which thus ceased to exist as a separate Urban District. The argument put forward by the Corporation now was that, having absorbed Walker, the agreement of 1902 only required their own consent for themselves to supply the energy necessary for the Walker trams. Mr. Justice Swinfen Eady, however, held that as the Walker order had been passed on to the company, even the Walker Council, if it still existed, could not consent to the Newcastle Corporation supplying. It should be pointed out that up to August 6th, 1910, the date of the expiry of the original agreement between the old Walker Council and the company, the Newcastle Corporation had been supplying the necessary energy under an arrangement with the company, with whom they had made terms, but they claimed the absolute right to continue the supply without terms after that date. The company did not take this view, and the present proceedings arose out of an application by the company for an injunction to prevent a continuance of the supply by the Corporation. This was granted. The injunction was, however, suspended until Jan. 13th in order to give time for the fresh electrical connections to be made. The Corporation will endeavour to deal with this point in the Bill which they are promoting in Parliament next session.

This is an extremely interesting result, as the position now is that the Newcastle Corporation, which owns its own tramways and supplies them from its own power house, is compelled to buy the energy for a portion of the lines within their boundary which they have hitherto been supplying.

LIMERICK ELECTRICITY SUPPLY

MR. A. V. CLAYTON'S report to the Borough Council of Limerick on the condition of the Corporation electricity supply works and distribution system has already been referred to in these columns. As the result of a careful examination of the whole system, and a series of tests on the generating plant, Mr. Clayton found the entire undertaking in a most exceedingly neglected condition, and complained of an entire lack of system and discipline. The plant consists of four gas engines driving D.C. generators, and supplied from gas producers. These latter were found to be working inefficiently, and one engine was in such a bad state, due to neglect, as to be incapable of being put into service. The switchboard and battery were likewise in a bad state, and severe criticisms are made on the condition of the distribution system.

Mr. Clayton recommends scrapping the gas plant altogether and replacing it by either Diesel oil engines or compound high-speed reciprocating engines; the latter are preferable, in his opinion, owing to the limited experience with Diesel engines in this country. A steam plant without a battery would, he estimates, show a gross saving of about £800 per annum over the cost of running at present, or nearly £700 after allowing for interest and amortisation on the extra capital for the new plant. He estimates the cost of the new plant at £4,500, which might be reduced to £3,700 by sale of the old plant.

ANNUAL DINNER OF THE GLASGOW LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE annual dinner of the Glasgow Local Section of the Institution of Electrical Engineers was held on Wednesday of last week. Mr. Sam Mavor presided, and some 240 members and friends were present.

Professor Barr, when proposing the toast of "the Imperial Forces," said that in all branches in which the Navy had made progress, the electrical side was the one which had shown the most definite advance. Sir J. H. A. Macdonald replied. When proposing "the Corporation of Glasgow," Sir Hugh Shaw Stewart complimented the Council on the advance made in the electrical side of their undertaking. The Corporation were encouraging the use of electricity for heating and cooking purposes, and the relation of electrical power to the abatement of the smoke nuisance was not being neglected.

Bailie A. Campbell responded, and gave some interesting details in connection with the Glasgow Electricity Department. He pointed out that the department was started about eighteen years ago with a capital of £18,000, whilst at present the citizens had invested, through their Corporation, something like £2,250,000 in their Electricity Department. The revenue from electricity for light and power, apart from tramways, amounted last year to something like £260,000. Eighteen years ago it was necessary to charge 7d. per unit to pay expenses, but now it had reached 2½d. per unit for lighting purposes, and 1d. for power. By the existence of the Electricity Department, and the interest shown by the users of electricity for driving motors, there was an annual saving of about 30,000 tons of coal. Sir Donald McAlister submitted the toast of "The Institution of Electrical Engineers," and Mr. S. Z. de Ferranti (President, I.E.E.) in his reply emphasised the importance of all electrical engineers assisting in original scientific research in electricity, which had, up to the present, only been done by individual members instead of a co-operated body. "The Glasgow Local Section" was then proposed by Mr. W. H. Patchell, and the chairman replied.

CORRESPONDENCE

THE CHICHESTER ELECTRIC LIGHT & POWER CO., LTD.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The attention of my Board having been called to a notice in the Press of the voluntary winding up of "The Chichester & District Electric Supply Company, Ltd.," I have been directed to ask the favour of your giving publicity to the following facts:—

That this company is the only body authorised to undertake the supply of electricity in Chichester, its powers being derived from a Provisional Order transferred to it by the Corporation of Chichester, and

That this Company is not, and never has been, in any way associated with the concern above referred to, or with any person connected therewith.

Yours obediently,
F. D. PEPPER.
Secretary.

The Chichester Electric Light & Power Co. Ltd.
7 Victoria Street, Westminster, S.W.
December 17th, 1910.

Atlantic Cable Amalgamation.—It is announced that negotiations have been completed for the amalgamation of the Western Union Telegraph Co. and the Anglo-American Cable Co. The Commercial Cable Co. have refused to enter into any combination for the control of the Atlantic cable service. According to the *Daily Telegraph* an agreement has been signed with the Postmaster-General for accepting half-rate for messages not in code. It is also stated that the British Government have granted landing rights for a third cable of the Western Union Telegraph Co.

Telewriter Shares.—In the King's Bench Division last week Mr. O. Bird sued Sir John Craggs and Mr. C. Howard Craggs for alleged misrepresentation in connection with the National Telewriter Co., Ltd. He stated that he was induced to underwrite 5,000 shares on an understanding that he would not be called upon to take them up, if the public did not subscribe for them. The public, as a matter of fact, did not subscribe for them, and several calls were made in respect of these 5,000 shares. Mr. Justice Eldon Bankes, after hearing the plaintiff's case, decided that no misrepresentation was proved, and that there was no case to go to the jury.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published December 15th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

27,968/09. **Commutating Poles.** Miles Walker (British Westinghouse Co.). This patent describes a method of obtaining automatic regulation of the commutating pole flux by connecting the exciting windings between two brushes close together in the neutral zone, one slightly in advance of the other. Wider brushes, and therefore a shorter commutator, can be employed. Four figures.

620/10. **A.-C. Electromagnets.** W. P. Orton (British Westinghouse Co.). In electromagnets with a central limb and side extensions outside the coil which almost touch the central limb at the bottom, a short-circuiting ring is sometimes employed to reduce chattering. According to this invention, an additional ring is placed round one of the faces of the outer limbs opposite the central moveable limb. This causes the latter to be tilted into contact with the outer limb, and the friction between them further reduces chattering. Five figures.

2,711/10. **Aluminium Field Coils.** Specialfabrik für Aluminium-Spulen und Leitungen Ges. (Berlin). Coils of bare aluminium wire are plunged, when hot, into a cold bath of sodium hydroxide or sodium carbonate solution. The liquid penetrates into the coils and, on drying, a strong insulating layer of aluminium oxide is formed on the wires. The carbonate solution is preferable, as it removes any grease remaining from the drawing process.

4,744/10. **Motor Starter.** I. Holmes (Keighley, York). A starter for large motors consists of a series of switch arms operated successively with time intervals by swivelling cams and each retained in the closed position by a pivoted bar engaging with a flat surfaced shaft. On the energising of the overload or no-voltage release coils, the shaft is rotated and all the switch-arms released. Nine figures.

10,315/10. **Oil Switches.** Siemens Bros. Dynamo Works, Ltd. (*Siemens-Schuckertwerke Ges.*). To obviate the danger of explosion in oil switches, the oil space in which the breaking movement takes place is completely filled, the oil extending upward either into a vent tube or into a narrow space enclosed by the rim of the vessel, so that the oil is kept under a slight head, whilst any gas can rise and escape. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Schmidt [Projection arc lamps] 1,751/10; Malachowski, 5,660/10; W. C. Heraeus [Tilting devices for mercury-vapour lamps] 8,126/10; Siemens Bros. Dynamo Works (*Siemens-Schuckertwerke Ges.*) [Search-lights] 8,507/10; Heraeus [Mercury-vapour apparatus] 19,563/10.

Dynamos, Motors, and Transformers: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Ship propulsion] 29,250/09; Siemens Bros. Dynamo Works (*Siemens-Schuckertwerke Ges.*) [Control of electrical machinery] 1,716/10; Crawford [Driving of train-lighting dynamos] 12,690/10; Siemens Bros. Dynamo Works (*Siemens-Schuckertwerke Ges.*) [Speed control of induction motors] 17,731/10, and [Polyphase commutator machines] 21,399/10.

Electric Ignition: Fortescue, 2,216/10; Cherry [Sparking Plugs] 17,745/10.

Electrometallurgy and Electrochemistry: Mulacek and Hatlanek [Induction furnaces] 674/10; Brougham (*Poldihütte Tiegel Gusstahlfabrik*) [Induction furnaces] 5,266/10; Henri, Heilbronner and Von Recklinghausen [Liquid steriliser] 14,129/10; Johnson (*McNitt*) [Electrolytic manufacture of alkali metals] 20,519/10.

Heating and Cooking: Binko and Mayer [Heating elements] 2,890/10.

Incandescent Lamps: Horvath, 7,373/10.

Instruments and Meters: Read [Absorption dynamotors] 578/10; Hookham [Motor meters] 3,174/10; Compagnie pour la Fabrication des Compteurs, etc. [Moving-coil recording instruments] 6,782/10.

Storage Batteries: Estelle [Manufacture of plates] 9,964/10.

Switchgear, Fuses, and Fittings: Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Motor controllers] 4,814/10, and [A.C. motor controllers] 11,904/10; Fortington-Neave [Motor controllers] 6,825/10; Wilkinson [Conduit and wiring fittings] 8,444/10; Gunner [Wiring conduit fittings] 12,903/10.

Telephony and Telegraphy: Fessenden [Utilisation of radiant energy] 28,577/09; Nash and Western Electric Co. [Covers for relays] 9,071/10; Schwarzhaupt [Telephone receiver] 12,739/10.

Traction: Stockdale [Signalling] 5,364/10; Moyes and Stevenson [Signalling] 5,615/10; Todd [Magnetic brakes] 7,048/10.

Miscellaneous: Long [Temperature indicator] 27,678/09; Scherl [Gyroscope stability mechanism] 27,688/09, 27,838/09, and 27,839/09; Oglesby and Ayton [Packing of incandescent lamps] 28,133/09; Ruthenberg [Distillation of coal] 29,328/09; Alliott, Hailwood and Dean [Miners' safety lamps] 29,818/09; Fabris [Signs] 30,469/09; Boult (*International Telechronometer Co.*) [Apparatus for supplying intermittent D.C. current] 849/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.:—Girardelli [Motors with rotating fields for transmitting angular movements to a distance] 22,714/10; Breslauer [Generators] 26,187/10.

Electric Ignition: R. Bosch, 22,580/10; Pieper, 27,230/10.

Electrochemistry: Morrison [Primary cells] 25,515/10.

Switchgear, &c.: Elektromechanische Werke Ges. [Rectifiers] 27,060/10.

Telephony, &c.: Siemens & Halske A.-G. [Automatic telephone circuits] 27,026/10; Girardeau [Wireless apparatus] 27,247/10.

Traction: Alwies [Street indicators] 27,652/10.

Opposition to Grant of Patents

15,151/09. **Controllers.** R. C. Lyness. The grant of this patent has been allowed in spite of opposition. It covers a contact finger for controllers, which is sprung into a bracket on the contact base, and is provided with a renewable tip sprung on to the finger.

10,802/10. **Prepayment Meter.** W. V. Palmer. This patent has been granted in spite of opposition. It covers a device for use in prepayment meters to prevent the insertion of too many coins at one time and jamming the mechanism.

Applications for Amendment

13,276/04. **Protective Devices for Transformers.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). The British Thomson-Houston Co. desire to amend this specification, which covers a method of connecting tripping coils in shunt to the secondaries of series transformers in the primary and secondary circuits of the transformer to be protected, and arranging them in such a manner that the tripping coils are operated on a change of the normal ratio of current in-put to out-put. It is proposed to delete certain parts of the specification and one figure, and to insert a specific reference to British Patents Nos. 3,896/04 and 11,364/04.

18,909/05. **Electric Welding of Sheet Metal.** A. F. Rietzel. The Pontelec Welding Patents, Ltd., of London, desire to amend this specification, which covers a process of electric spot welding, consisting in providing a number of contact spots over the surface of the sheets and then applying current and mechanical pressure until the sheets soften and weld at the contact points. It is proposed to insert a reference to British Patent No. 11,921/03 by Mr. Ferranti, and to disclaim the melting of the metal at the points of contact.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: F. M. Ekert [Insulating material] 17,396/05.

Dynamos, &c.: J. W. Macfarlane [Hydro-extractors and vertical motors for same] 19,060/02; H. Leitner and R. N. Lucas [Train-lighting system with differentially wound generator] 18,581/03.

Electrometallurgy, &c.: H. M. Chance [Electrolytic purification of metals] 17,449/05.

Instruments, &c.: W. Stanley [Integrating watt-meter] 18,858/02.

Switchgear, &c.: British Thomson-Houston Co. (*E. M. Hewlett*) [Circuit-breaker with magnetic blow-out without special coil] 17,193/01; T. Zweigbergk [Traction controller] 19,032/02; W. Fairweather (*Diehl Manufacturing Co., U.S.A.*) [Controllers for sewing machines] 18,907/03; W. and J. Y. Middleton [Cable couplings and terminals] 18,919/04.

Telephony, &c.: O. Imray (*Soc. des Telegraphes Multiplex, System E. Mercadier*) [Multiplex telegraph with alternating currents] 18,867/03; C. M. Jacobs and A. H. Nicholson [Automatic telephone exchange] 17,380/05.

Traction: J. Gresham [Pipe couplings for railway carriages] 17,423/01; T. Zweigbergk [Multiple-unit control system] 19,032/02; J. Carter, G. Hall, and A. Parsons [Automatic circuit-breakers or hanger cut-outs for trolley wires] 4,918/04.

Miscellaneous: H. E. Parsons [Smoke consuming furnace] 17,163/01; G. L. Scott [Oven with air circulation] 17,510/02; R. P. Lloyd and P. Noel [Advertising device] 17,786/05.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

CALENDARS, &c.—A very serviceable desk calendar and blotting pad has been sent us by Bruce Peebles and Co., Ltd. (Edinburgh). A feature of this is the large note-book attached to the left-hand side consisting chiefly of squared paper, and with the first few pages devoted to abridged specifications and approximate price lists of the firm's standard manufactures.

Siemens Brothers' Dynamo Works, Ltd., conjointly with Siemens Brothers & Co., Ltd., have been kind enough to send to our editor and assistant editor copies of the 1911 issue of their well-known pocket diary in morocco leather binding. This, as usual, contains in a compact form much useful information and a new set of illustrations which give a good idea of the wide range of the activities of the two firms.

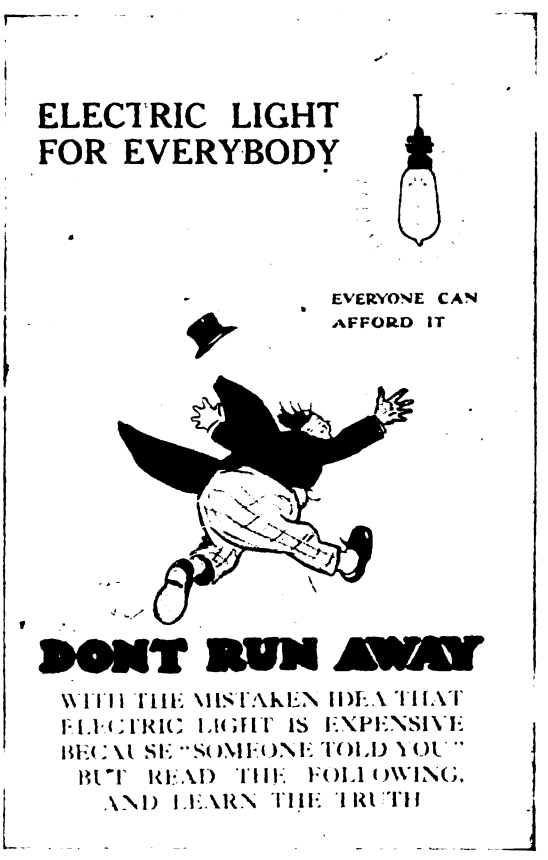
The convenient pocket diary of Simplex Conduits, Ltd., makes its appearance in an even more attractive form than usual this season. Full particulars of standard conduits are included, with many useful tables of wires, &c., and quite a compendium of electric engineering information, the lighting data being particularly well selected. The Company request us to state their stock of these diaries is already exhausted.

The Union Electric Co. have adopted an effective coloured design showing a large Excello lamp hanging over London for their wall calendar for 1911. The same design is also being used as a show-card, and can be supplied to contractors with their own names and addresses printed on.

FITTINGS.—A handsome illustrated catalogue of artistic electric light fittings and sundries is being issued by A. Emanuel and Sons, Ltd. (13 George Street, Manchester Square, W.). This deals with a great variety of brackets, ceiling fittings, pendants, lanterns, electroliers, standards, hand-lamps, etc., for interior lighting, as well as water, light, and other fittings for exterior lighting, reflectors and signs, ornamental metal plates and accessories. The interest is enhanced by the fact that a large proportion of these fittings are manufactured at the company's own works.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ARC LAMPS.—A new list of enclosed arc lamps is being issued by Crompton and Co., Ltd. (Salisbury House, London Wall, E.C.). Full descriptions of a variety of patterns are included, both for continuous and alternating currents. Among them are single carbon and twin carbon lamps for use under various conditions, single and double enclosed, with several different styles of lantern and globe. Full lists of accessories and spare parts are included.



INSULATING VARNISH, &c.—A well got up catalogue of special varnishes and other preparations for the insulation of electrical machinery is being issued by Messrs. Pinchin, Johnson and Co., Ltd. (26 and 27 Bevis Marks, E.C.). A great deal of useful information is given regarding each class of materials listed, facilitating their selection and application. The booklet is also made attractive by photographs of machines in the construction of which those compounds are used. The range of varnishes is too long to repeat here, but the thoroughness with which the company has gone into the requirements of manufacturers of electrical machinery is shown by the fact that no less than nineteen varieties, each suited to particular electrical purposes, have been standardised. Among these we have special armature varnishes for stoving, elastic and quick-drying varnishes, special varnishes for traction motors, black and golden finishing varnishes, core plate and acid resisting varnishes, and a special material for making up micanite. Joint box compounds and similar materials are also made in considerable variety.

TELEPHONES, &c.—We have received from the Western Electric Co., Ltd. (Norfolk House, Victoria Embankment) a copy of a new list of telephone switchboards and instruments, including apparatus for central battery, magneto, and local battery systems. A great variety of private exchange boards are dealt with, as well as instruments of the wall and table patterns, both for exchange and private lines. Another section contains particulars of intercommunication sets on several different systems. Street, portable, and military telephone sets are also included. A smaller list deals with domestic telephones and intercommunication sets, and separate pamphlets are also being issued regarding cable terminals for outdoor and indoor line construction, condensers for telephone and telegraph service, lightning protectors, and aerial cable and line construction specialities.

MOTOR-CAR ACCESSORIES, &c.—A list from Messrs. S. Smith & Sons (9 Strand, W.C.) contains particulars of a number of patterns of speed indicators, lamps, horns, &c., including complete dynamo outfits for electric motor-car lighting, with cut-out arrangements depending both on speed and voltage. Electric horns are also dealt with. Separate lists deal with watches, clocks, &c., for all requirements.

TELEPHONES.—The Peel-Conner Telephone Works, Ltd. (Peel Works, Adelphi, Salford, Lancs.), have issued the first of a series of bulletins dealing with their products. This number is devoted to Magneto Call Telephones, and is far more than a price-list. It contains descriptions of a complete and technical character of every pattern of this class of apparatus, which the company makes, and is illustrated with finely-finished photographic blocks of the various instruments and parts, and also drawings of connections, etc. So complete is the bulletin that if the intention of the company to produce successive ones in the same style as carried out, they will, when completed, form a veritable treatise on the whole subject of telephony. We have also received from the same firm a pamphlet in an artistic folder, giving an account of the proceedings at the official inspection of the new Central Telephone Exchange at Glasgow, which was equipped by the Peel-Conner Telephone Works, Limited. The publication includes a brief but well-illustrated description of the Exchange, mentioning particularly the important features, and it also quotes press notices from some of the leading daily papers. It is evident that the Peel-Conner Telephone Works intend to keep the telephone exchange managers and officials well supplied with exceedingly attractive literature on the subjects which interest them.

SUPPLY ADVERTISING.—A striking new leaflet, the front page of which is reproduced here, is being issued by the Electric Publicity Committee. The sketch of the man running away is by Mr. Charles Crombie. The savings effected by electrical

methods are tersely and forcibly put in the interior pages. The circular is intended to arrest the attention of non-consumers, and to dispel antiquated ideas of the expense of electric lighting. The committee are also issuing a booklet for shopkeepers, illustrated with specimens of up-to-date lighting.

ARC LAMPS.—The Globe Electric Co., Ltd. (11 Farringdon Avenue are issuing a new pamphlet on their "Multax" long burning flame arc lamp, of which considerable quantities have been sold since their introduction early in the year. A full description of this lamp with its "bridge core" carbon was given in ELECTRICAL ENGINEERING, March 10th, page 163. It is important to notice that the prices of the special double carbons used have been reduced so that they are now even cheaper for given burning hours than the single carbons used in some competing lamps.

Crystal Palace School of Engineering.—The award of certificates took place at the school yesterday morning. Mr. Alexander Siemens was in the chair.

OSRAM LAMPS

THE WIRELESS TELEGRAPH PATENT CASE

A REPORT of the first two days' proceedings in the action between Marconi's Wireless Telegraph Co. and the British Radio Telegraph and Telephone Co. was given in our last issue. On Monday of last week, the first day, Mr. Astbury, K.C., for the Marconi Co., opened that part of the case in respect of Patent No. 7,777 of 1900, covering the use of a closed oscillating circuit inductively coupled to the aerial circuit by means of a transformer, the periods of oscillation of these circuits being the same. Mr. Justice Parker will probably deliver judgment with regard to this patent before the other two for the magnetic receiver and the toothed-wheel discharger respectively are dealt with. Mr. Swinburne was in the witness box on Tuesday, Wednesday, and Thursday, and Mr. Dugald Clerk on Friday. The hearing was resumed on Tuesday, when Mr. J. Pletts (of the Marconi Co.) gave evidence, and Mr. Walter addressed the Judge on behalf of the Marconi Co. Yesterday Mr. Terrell gave his opening address for the defendants, and the case was then adjourned until after the Christmas vacation, when it will be taken on three days in each week until completion.

It will be remembered that Mr. Astbury described the particular advantages of the arrangements in Marconi's patent, and pointed out that the defendant company had exactly similar apparatus except that an auto-transformer was employed in place of a double-winding transformer. Mr. Swinburne, examined by Mr. Walter, said that the feature of the patent was that all the circuits were tuned right through. He had tested oscillating circuits arranged according to the diagram published by the defendants, and had proved that it made no difference whether a double-winding transformer or an auto-transformer were employed.

Mr. Terrell then cross-examined Mr. Swinburne with regard to several patents put forward by the defendants as anticipating Mr. Marconi's patent. The first of these, No. 8,575 of 1891, by Nikola Tesla, describes apparatus for producing high potentials at high frequency by discharging an oscillating circuit into the primary of a transformer; the second, No. 20,981 of 1896, also by Tesla, covers an arrangement in which a condenser is intermittently charged and discharged into the primary of a transformer by means of a high-speed rotary commutator. Mr. Terrell read out a passage in this last specification stating that the charging and discharging circuits should have equal periods of electrical vibration. Mr. Swinburne held, however, that there was no real resonance in the arrangement, nor did he think that a passage in a Paper read by Tesla before the National Electric Light Association at St. Louis in 1893, which Mr. Terrell read out, indicated real tuning. Further, in Tesla's arrangements, the secondary was a closed circuit, and there was no suggestion of using it as a radiator.

Questioned on Lodge's patent, No. 11,575 of 1897, Mr. Swinburne admitted that Lodge appreciated the importance of tuning the receiving to the transmitting station, so as to build up oscillations in the receiving circuit and to admit of selective signalling. Lodge did not, however, divide his transmitting circuit. One figure showed a coherer and a battery in a secondary circuit of a transformer, the primary of which was in series with the aerial, but this coherer circuit could not be tuned to the aerial circuit. Two other Lodge patents, Nos. 18,644 and 29,505 of 1897, were also referred to by Mr. Terrell. The first related to receiving circuits for Hertzian wave telegraphy, and the second to tuning for selective working in magnetic induction telegraphy. A patent by Dr. S. P. Thompson, No. 525 of 1898, also relating to tuning in telegraphy by magnetic induction, was also discussed, but Mr. Swinburne pointed out that in both these last cases the circuits were tuned to the frequency of the impressed impulses.

A patent by Braun, No. 1,862 of 1899, was then put forward by Mr. Terrell as anticipating Marconi. This claimed the use of long waves obtained by inserting inductance in the oscillatory circuit, and incidentally described the use of a transformer between the closed oscillatory and aerial circuits. Mr. Swinburne admitted that this arrangement was the same as Marconi's with the exception that nothing was said about tuning the secondary to the primary circuit. Another Braun patent, No. 1,863 of 1899, referred to the vibrations being superposed on the secondary circuit, but Mr. Swinburne held that in this also there was no intention of tuning.

On Thursday, in the course of Mr. Swinburne's cross-examination, experiments were made by Mr. Duddell with an oscillograph projecting on to a small screen, to demonstrate the effect of altering the electrical constants of an oscillating circuit, and the coupling between two oscillating circuits. The difficulty of producing resonance with a very tight coupling, and the lengthening of the period of highly damped waves by the insertion of resistance, were also shown. Finally, an experiment was made on a model of the defendants' apparatus. The inductance *M* (called by the plaintiffs an auto-transformer) in the diagram of the defendants' apparatus was divided into two parts, which were put at right-angles

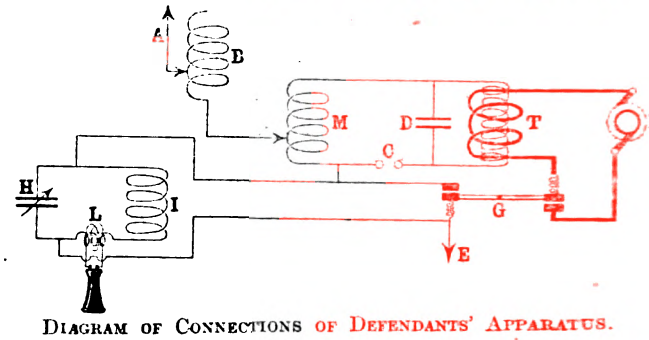

DIAGRAM OF CONNECTIONS OF DEFENDANTS' APPARATUS.

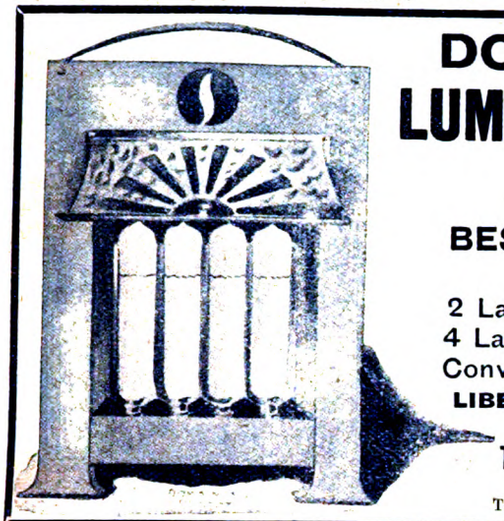
so as to have no inductive effect on each other, and it was admitted by Mr. Swinburne that the effect was practically the same as when the two parts were side by side (as they are in the actual apparatus), *i.e.*, that there was practically no mutual induction between them. From this, Mr. Terrell inferred that there was no transformer action in the defendants' arrangement.

Mr. Swinburne, examined on the Marconi patent in question, said that tuning was the main point of the claims. No particular kind of transformer was claimed. He did not know why Marconi had not claimed tuning the receiving circuits also. Mr. Terrell suggested that the reason was that it was well known at the time. According to Mr. Swinburne, an auto-transformer with the whole winding common to both circuits was still an auto-transformer, but Mr. Terrell asserted that the winding was then merely an inductive shunt to the circuit, *i.e.*, that it was only a transformer so long as there was a step-up or step-down effect, and consequently that the defendants' arrangement of coils could not be called a transformer.



On Friday, Mr. Dugald Clerk was examined on the same points as Mr. Swinburne. He confirmed the evidence as to the novelty of the arrangement described in Marconi's patent, and the identity of the defendants' arrangement with an auto-transformer.

Mr. J. Pletts, of the Marconi Co., giving evidence on Tuesday, stated that he had erected the early Marconi stations in the Sandwich Islands prior to 1900. They had then only succeeded in communicating over 70 miles, but after applying the system described in the patent, they reached to 150 miles, or over double. He also gave evidence with regard to the action of the defendants' apparatus.

Mr. Walter then summed up the case for the Marconi Co. He dealt chiefly with the question of infringement, insisting that the defendants' inductance coil acted as an auto-transformer, and therefore came within the claims of the Marconi patent.

Mr. Terrell then proceeded to state the case for the British Radio Telegraph & Telephone Co. He said that he would show that there was no subject-matter for Marconi's patent, as it was merely a combination of Braun's transformer with what was common knowledge in 1900 as regards tuning. As Marconi did not claim the use of an auto-transformer, he did not think the defendants infringed if their device acted as such, but he hoped to prove, with the aid of expert witnesses, that the defendants' device did not even act as an auto-transformer. Referring to the diagram, he held that the few turns of *M* below the point where the aerial connection was made acted merely as an inductive shunt, and explained the action as follows:—The oscillatory circuit consisted of a capacity *D*, the inductance *M*, and a spark-gap *C*. When an oscillatory discharge took place across the gap, a portion of the total current was conducted into the aerial from *M*, the lower turns acting as an impedance to this current and forming no part of the radiating circuit. The aerial circuit could be said to be from *A*, through *B*, the upper portion of *M*, through *D* and across the gap *C* to earth *via* the key contact

Mr. Swinburne was again called at this point, as it was complained that this point of view had not been put to him. He disagreed with it, and stated that during radiation, the aerial circuit would be from *A*, through the lower turns of *M* to earth, and that consequently these turns could be looked upon as part of a secondary circuit receiving oscillations from the primary oscillatory circuit. Mr. Terrell, continuing his speech yesterday, pointed out that the omission of an iron core in the inductance *M* made the transformer effect negligible.

Some interesting information with regard to the expenses of the case were published in the *Daily Telegraph* last week, prefixed, however, by the words "it is stated." Our contemporary says that each of the leading counsel has his brief marked at 400 guineas, to which a daily fee, known as a "refresher," has to be added. According to the custom of the profession, the juniors receive two-thirds of the "leader's" fee. Hence the retainers will make an aggregate of about £1,740, to which an extra £100 may be added in the case of Mr. Astbury, K.C., in his capacity as a "special."

LOCAL NOTES

Beckenham: *Street Lighting.*—The Electricity Committee recommend that the Shortlands district be lighted by electricity, the price per lamp per annum being £3 7s. 6d. In addition, the Committee are to defray the cost of the services, cables, lamps, and fittings at an estimated cost of £350.

Glasgow: *Smoke Abatement Exhibition.*—There is a surplus of £1,145 from the Smoke Abatement Exhibition, which was recently held. It is recommended that £200 of this surplus be paid to the Electricity Department and a similar sum to the Gas Department. The balance is to be handed to the Sub-Committee of the Health Committee on Air Purification.

Handsworth: *Tramway Electrification.*—The Town Clerk has been instructed to ask the General Manager of the Birmingham Corporation Tramways as to the steps that have been taken under the arrangement made with the Council for converting the cable lines to electric traction. The Tramways Committee have given instructions for the preparation of plans, sections, and specifications, for the track work, and under the agreement with the Corporation the latter are to supply the overhead equipment.

Leicester: *Electricity Undertaking.*—Mr. James Swinburne, who was called in recently to advise the Corporation as to the best method of reorganising the electricity undertaking—there being a separate tramway power station—recommended that the two works should be linked up and worked as one undertaking. He estimates that a saving of £2,000 per annum will be effected by this course.

London: *Lewisham: Street Lighting.*—The County of London Electric Supply Co. and the South Metropolitan Gas Co. have been granted permission to carry out experimental street lighting.

County Council: Assessment of Greenwich Generating Station.—The assessment of the L.C.C. power station at Greenwich was inserted in the quinquennial valuation list at £60,300 gross, and £40,200 rateable. The Local Government Committee of the County Council appealed against this, and the figures were reduced to £60,000 gross, and £38,000 rateable. The Committee are now advised that a fair valuation would be £27,500, and an appeal to Quarter Sessions is recommended.

Marylebone: Electricity Accounts.—The revenue account for the September quarter shows a gross income of £27,756 against £22,826 for the September quarter of last year. The two items primarily responsible for the increase are the larger public lighting income and the substantial turnover of the Sales Department. After reducing the gross income for each quarter by the public lighting special charges, and the prime cost of the various works undertaken by the Sales Department, the comparative figures are: Sept., 1910, £24,681, and Sept., 1909, £22,199, giving an increase of £2,482, against which has to be set the cost of the Sales Department establishment. The working of the Sales Department for the quarter shows a loss of £178, compared with £509 for the June quarter. The average costs per unit sold were 1·25d. per unit, exclusive of capital charges, compared with 1·362d. and 1·767d. for the two preceding September quarters. At the meeting of the Council on Thursday, Councillor Duncan Watson adversely criticised the working of the electricity undertaking, and said he failed to see that there was evidence of anything having been done by the fifteen highly trained business-getting officials in the Department, about whom so much had been heard.

Norwich: *Proposed Purchase of Tramways.*—The Law and Parliamentary Committee recommend that notice of purchase be given to the Norwich Electric Tramways Co. for Aug. 6th, 1911.

Paisley: *Tramway Extension.*—The extension to Rouken Glen from Barrhead will be opened by the Paisley & District Tramways Co. in a few days' time.

Scarborough: *Tramways.*—A conference took place between the Corporation and the Scarborough Tramways Co. last week with regard to the winter service, but although a long discussion ensued, it is stated that no fresh proposals were formulated. The matter was later discussed at a meeting of the Streets and Buildings Committee, who recommend that the company be proceeded against for non-compliance with the order of the Board of Trade. The maximum penalty is £5 per day.

Shipley: *Quick Motor Connection.*—The Electricity Department carried out a prompt piece of work last week. At 10 a.m. on Friday a telephone message was received for an electric motor; at 11 o'clock the application form was filled in and signed, and the deposit paid, and within twenty-four hours the complete installation, including motor, switchgear, &c., had been installed and actually put into operation. Further, the whole of the work was done by the ordinary staff in the ordinary working hours.

Sunderland: *Electric Lighting Charges.*—There was some discussion at the last meeting of the Corporation with regard to the proposed revision of the electric lighting tariffs mentioned in our last issue. On a vote being taken there was a tie, but the Mayor gave his casting vote in favour of the Committee's recommendations.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Brighton.—Additional sub-stations are contemplated.

Edinburgh.—An application for an additional loan of £75,000 for electrical purposes is to be made.

Gateshead.—The Guardians invite tenders for generating machinery, storage battery, switchboard, and wiring installation for about 500 lights. Particulars from the Clerk, Prince Consort Road, and tenders by Jan. 9th.

Harrogate.—An application for a loan of £2,500 for new mains is to be made.

Leyton.—A Local Government Board inquiry was held last week concerning a loan of £7,000 for electrical extensions.

London: *Battersea.*—Additional services at an estimated cost of £54 are to be laid.

County Council.—It has become necessary to instal new high-tension switchgear in place of the existing plant at the Camberwell and New Cross sub-stations, owing to the existing installation being of an old pattern and not complying with the electricity regulations recently issued under the Factory and Workshops Act. Tenders are to be invited for the new work.

Southampton.—The Electrical Engineer proposes to duplicate the main from the Western Shore works to Shirley at an estimated cost of £1,350. He also proposes to duplicate the Portswood main over a portion of its length at an estimated cost of £800.

Yarmouth.—The Local Government Board have sanctioned loans of £3,500 for mains; £750 for a cooling tower; and £1,550 for public lighting.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Conversion of premises at junction of Merton Road and Standen Road, Southfields, to cinematograph hall.

Structural improvements at the Redvers Street School, Hoxton.

PROVINCES.

Barnsley.—Electric theatre in Eastgate.

Birmingham.—New Council School in Cherrywood Road, Bordesley Green.

Bolton.—Presbyterian Church in St. George's Road.

Bradford.—Infirmary in Duckworth Lane. Architect, Mr. K. D. Young.

Cardiff.—Additions to Seamen's Institute, Barry Dock. Architects, Messrs. Tather and Wilson.

Digitized by Google

Carlisle.—School in Newtown district.
Gravesend.—Electric theatre, Windmill Street.
Grimsby.—Extensions to Public Library.
Haslingden.—Lighting of new Infirmary.
Lincoln.—Library in Free School Lane.
Manchester.—Alterations and additions to Municipal School, Cavendish Road, Withington.
Margate.—New general hospital. Trustees of Margate Cottage Hospital.
Paisley.—Extensions to Post Office.
Pudsey.—United Methodist Sunday School and Institute. Architect, W. H. Dinsley, Chorley, Lancs. Tenders for building by Jan. 7th.
Redditch.—School in Bridge Street.
St. Helens.—School in Robin's Lane.
Swansea.—Cinematograph hall in High Street.
Weston-super-Mare.—St. Paul's Church. Erection to be commenced shortly.

MISCELLANEOUS

Ayr.—It has been decided to proceed with the Hawkhill tramway extension at an estimated cost of about £13,000.
Dundee.—A report has been prepared by Mr. Peter Fisher, the tramway manager, upon some tramway extensions at an estimated cost of £7,190.
London: *Hackney.*—The Guardians require telephone installations in the "A" and "B" pavilions at the Homerton Infirmary. Particulars from the Clerk, and tenders by Jan. 4th.
County Council.—Tenders are invited for the supply of cable ducts in connection with the reconstruction of the tramways from Baring Street, via Southgate Road and Green Lanes, Finsbury Park.
Salford.—Tenders are invited by Jan. 16th for a steam-driven air-lift pumping plant at the Frederick Road Electricity Works.

TENDERS RECEIVED AND ACCEPTED

Barnsley.—The tender of the Tudor Accumulator Co., Ltd., for replating the traction battery at £555 15s. has been accepted.
Broadstairs.—The tender of the Isle of Thanet Electric Lighting & Tramways Co. to erect five arc lamps in High Street and St. Peter's Road at a cost of £50 per annum has been accepted. The Gas Company offered to do the work for £42 15s., but an amendment to accept this tender was rejected at the last meeting of the Council.
Glasgow.—The British Westinghouse Co. have offered to put down an electric lighting and power plant at the Scottish History Exhibition next year on condition that the Corporation purchase the plant at the close of the exhibition at £4,805, a price which is considerably less than cost. The stipulation is that the plant is to be acquired by the Corporation as their requirements necessitate, the purchase money not being paid until the installation of the plant is complete. The Glasgow Electricity Committee recommend the acceptance of the offer.
London: *Battersea.*—The offer of J. B. Garnham to purchase scrap copper from the Electricity Works at £54 2s. 6d. per ton has been accepted.
County Council.—The tender of the St. Pancras Ironworks Co., Ltd., for a weather shelter at New Cross Gate at £210, is recommended for acceptance.
The following tenders have been received for charging apparatus for the electrically-driven motor escape vans which are to be placed at the new fire stations in Parnell Road and Brunswick Road, Bow:—Electric Construction Co., Ltd., £260; Lancashire Dynamo & Motor Co., Ltd., £280 15s.; General Electric Co., Ltd., £293; Wright & Wood, Ltd., £304. The first-named tender is recommended for acceptance.
Walsall.—The tender of Messrs. Babcock & Wilcox, Ltd., for a water-tube boiler has been accepted at £1,189. The Underfeed Stoker Co. will supply the stoker.

The Diesel Engine Co., Ltd., have just received the following orders:—From the Hoffmann Manufacturing Co., Ltd., of Chelmsford: One 220 kw. generating set, consisting of a three-cylinder Diesel engine, running at 187 r.p.m., direct coupled to a shunt wound multipolar continuous current generator of 110 volts, built by the General Electric Co., Ltd., to run in parallel with the existing Diesel generating set of the same output. From the Daimler Motor Co., Ltd., of Coventry: One 525 b.h.p. three-cylinder Diesel engine, running at 150 r.p.m., direct coupled to a Dick, Kerr two-phase alternator, built to run in parallel with the two existing 218 kw. Diesel engine sets, which have been running since February, 1908.
Messrs. David Bridge & Co., Ltd., Castleton, Manchester, have received an order for a hydraulic vulcanising press, 14 ft. long by 54 in. wide, with 12 rams, for the Premier Reforming Co., Ltd., of Walthamstow, for the manufacture of sheeting and other goods. Messrs. Bridge have also installed three of their special heavy grinders, each electrically driven.

APPOINTMENTS AND PERSONAL NOTES

Mr. Herbert A. Jones, who has made many friends during the past eleven or twelve years he has been with the Phœnix Dynamo Manufacturing Co., Ltd., of Bradford, has resigned his position as managing director, and in the new year is commencing business in London in partnership with Mr. T. K. Irwin (for many years general manager of John Butler & Co., Ltd., Stanningley Ironworks, Leeds) under the style of Irwin & Jones, engineers and agents, 5 London Wall Buildings, London, E.C. When Mr. Jones first assumed control the company only employed a dozen hands or so, whereas now some three hundred are at work.
There were 48 applications for the post of traffic assistant in the L.C.C. Tramways Department at a salary of £600 per annum, and the following three gentlemen formed the final selection:—Mr. R. Fritz Rogers, Traffic Superintendent, London United Tramways; Mr. F. Schofield, Tramways Manager, Leyton District Council Tramways; and Mr. L. Slattery, Manager of the Oldham Corporation Tramways. The Highways Committee recommend the appointment of the last-named.
The Bristol Corporation Electricity Department desires to find appointments for a number of trustworthy and experienced engine-drivers, stokers, and other station hands, whose services are obliged to be dispensed with owing to one of their generating stations being no longer required. (See an advertisement on another page.)
Owing to the death of Mr. M. Sutherland, Burgh Electrical Engineer at Oban, Mr. E. G. Stagyle has been appointed Burgh Electrical Engineer temporarily.
A meter tester is wanted at Barrow-in-Furness, with experience of Chamberlain & Hookham meters.
A junior shift engineer is required at Stepney (see an advertisement on another page).

Obituary.—We regret to announce the death of Mr. J. R. Salter, General Manager of the Lancashire United Tramways Co. Mr. Salter, who was only 35 years of age, spent several years as assistant to the late Dr. John Hopkinson, and later joined the late Sir Clifton Robinson as assistant in connection with the electrical equipment of the London United and Bristol tramway systems. He thus had a great deal to do with the introduction of electric traction in London, and the difficulties which arose in connection with electrolysis, and interference wth the Kew Magnetic Observatory. In 1902 Mr. Salter took up the duties of Engineer-in-Chief to the Lancashire United Tramways Co., and has been responsible for the complete organisation and development of that extensive system.
The New York Explosion.—The serious explosion which occurred in New York on Monday morning, near the Grand Central Terminus of the New York Central Railway, has given rise to somewhat conflicting reports, but appears to have originated on the premises of New York Central Railway in the ignition of lighting gas escaping from a pipe or reservoir broken by a train running into the buffer stops. The gas seems to have pervaded the underground station of the New York subway, and the explosive mixture is reported to have been ignited by an electric spark. This first explosion caused the explosion of a car of dynamite on the adjoining premises of the New York, New Haven, and Hartford Railway, and the complete wreck of a new sub-station of that railway under construction near by. Considerable damage was done to all buildings in the neighbourhood, several persons were killed, and a large number were injured. In Lexington Avenue a tramcar is said to have been lifted bodily off the ground, and to have fallen over on to a passing automobile.
The G.B. System in the Mile End Road.—An application was made on Friday to Mr. Justice Ridley regarding the verdict recently given against Sir John Benn for £12,000 damages in respect of certain statements made by him concerning the G.B. surface-contact system. At the trial a stay of execution was granted provided security was given for £5,000 within ten days. The application now made was to the effect that this security had not been given, and that an affidavit had been filed stating that Sir John Benn had no intention of giving it. In these circumstances, as Messrs. Griffiths and Bedell propose to issue a bankruptcy notice against Sir John Benn, an order of the Court was asked for, saying that the stay of execution was removed. On behalf of Sir John Benn it was asked that the order should not be made in view of the magnitude of the damages, and the fact that the appeal against the verdict was expected to be heard early in January. Mr. Justice Ridley decided that the stay was removed.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £59 to £59 10s. per ton (last week, £59 to £59 10s.).

Canadian Agencies.—A Birmingham company manufacturing electrical fittings are anxious to appoint first-class Canadian agents.

A Montreal importer of electrical supplies inquires for the names of United Kingdom manufacturers of ignition magnetos.

Further information at Office of High Commissioner for Canada, 17 Victoria Street, London, S.W.

An agent in Vancouver offers to represent United Kingdom manufacturers of electrical appliances and supplies.

Exhibition Awards.—The India Rubber, Gutta Percha, & Telegraph Works Co., Ltd., Silvertown, London, E., have received the following awards for their display at the Railway & Land Transport Exhibition held at Buenos Ayres:—Three grand prizes for brake hoses, motor tyres, and cycle tyres; gold medal for india rubber tiling; and diploma of honour for telegraphic apparatus.

Agency.—On and after January 1st next, Messrs. Felten & Guilleaume's agency for insulated wires and cables, rail bonds, and rubber manufactures will be conducted by Mr. R. R. Todd at 324 Birkbeck Bank Chambers, W.C. Mr. Todd has for the last eight years managed this agency, first under Messrs. W. F. Dennis & Co., and subsequently under the Lahmeyer Electrical Co., Ltd.

Bankruptcies.—The last day for receiving proofs in the bankruptcy of W. G. Everingham, electrician, 37 Auckland Road, Ilford, is Dec. 28th. The trustee is Mr. J. Mercer, 14 Bedford Row, London.

A first and final dividend of 7d. in the £ will be paid on Dec. 29th in the bankruptcy of A. E. Felgate and W. Storey, electrical engineers, 10 Queen Victoria Street, Reading.

New Zealand Agency.—A Christchurch firm of engineers desires to obtain the agency of British manufacturers of electrical motors, cables, and electrical fittings. Apply 73 Basinghall Street, London.

Change of Address.—The London agency of Dr. Heinr. Traun was removed on Dec. 21st from 8 Redcross Street to 23a Goswell Road.

Christmas Holidays.—Siemens Brothers Dynamo Works, Ltd., inform us that their stores and showrooms at 39 Upper Thames Street, E.C., will be closed on Monday and Tuesday, 26th and 27th inst., and also for stocktaking on Friday and Saturday, the 30th and 31st.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

India Rubber, Gutta Percha & Telegraph Works Co.—At the annual meeting on Tuesday, the abnormally high prices of raw rubber which ruled during the spring and summer this year were referred to. The directors thought that on the whole a difficult position had been reasonably met with regard to stocks. A dividend of 5 per cent. was sanctioned, after an amendment to the effect that a 2½ per cent. dividend should be paid in order to provide for special reserve against stocks, had been ruled out of order.

British Columbia Electric Railway Co.—The annual general meeting was held on Monday, Mr. R. M. Horne-Payne, Chairman of the Company, presiding. The Chairman said that they now seemed to have reached a period of settling down to steady regular conditions of prosperous commercial life in the cities which the Company's system served. The development that was taking place was involving much capital expenditure, and would continue to do so, but this was a necessary and satisfactory feature of any undertaking in a new country. The Company had now about 150 miles of electric railway working, and about 12 to 14 miles in an incomplete state. At the close of the annual meeting a resolution was passed increasing the capital of the Company by 700,000 shares of £1 each.

Birmingham Electric Club.—At the annual meeting of the Birmingham & District Electric Club on Saturday, Mr. F. W. Foster was elected president.

The Society of Engineers.—Among the premiums for papers published during 1910, which were awarded at the annual general meeting of the Society of Engineers on Monday of last week, was one for a paper by Mr. A. H. Allen on "Electricity from the Wind."

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—*Associate Members:* H. H. Brierley, S. E. Day, R. E. Lovelace, H. W. Malcolm, H. F. Nottage. *Students:* L. F. Burgess, C. S. Buyers, B. C. Clayton, A. W. Head, A. D. Peacock, R. W. Riley.

MOTOR-CONVERTERS

(*La Cour Patents*)

The recent order for SIXTEEN MOTOR-CONVERTERS (for one Supply Company) which has just been placed with **Bruce Peebles & Co., Ltd.,** *Edinburgh, makes an aggregate of 36,700 K.W., and comprises 76 machines (of this type) ordered from that firm since 1st January, 1910.*

BINDING "ELECTRICAL ENGINEERING." — Vol. VI. of "Electrical Engineering" (Jan.—Dec. 1910) closes with our issue of to-day. An index for the volume will be ready on Jan. 5th, and copies may be ordered from any newsagent or bookseller at the price of 1d. each (or post free, 2d.). Binding Cases, including index, price 2s. each, post free 2s. 4d. (Abroad 2s. 6d.) Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to us, carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad.

SUMMARY

The Westminster City Council, after having passed a resolution permitting the St. James's and Pall Mall Electric Light Co., to maintain some flame arc lamps in Piccadilly free of cost, have rescinded it owing to representations by the Gas Co. Complaints are made as to the new gas lighting in Regent Street, compared with the previous electric lighting. (Page 820.)

A description is given of the electrical equipment of the works of Messrs. J. B. Brooks & Co., at Birmingham, where the Brooks' cycle saddle and other leather goods are manufactured. (Page 821.)

Mr. H. W. Clothier read a Paper at the last meeting of the Newcastle Local Section of the Institution of Electrical Engineers on the Merz-Price system of balance protection, describing its various applications and the special form of iron-clad switchgear which his company have developed. An interesting discussion followed. (Page 822.)

Two light railways in Austria-Hungary are being equipped on the single-phase system, and the conversion to electric traction of several main-line sections of the State railways will shortly be commenced. It is probable that these will be equipped uniformly on the single-phase system with a trolley-wire pressure of 10,000 volts at 15 or 16 cycles. (Page 825.)

A new agreement has been made between the Stepney and Poplar Councils for standby supply.—The Islington Council have decided to put its wiring powers into force.—Arrangements for giving complete telephonic intercommunication in Glasgow after the transfer of the company's undertaking to the Post Office next year are in hand.—Scarborough Corporation have been granted a summons against the Tramways Company in respect of the winter service.—The Taunton Council are considering their position in relation to their free wiring agreements. (Page 825.)

Among the specifications published by the Patent Office on Thursday was one by R. A. Fessenden for tanks for evaporating water by the heat of the sun and supplying low-pressure turbine generating plant. The British Thomson-Houston Co. describe a system of electrical propulsion particularly adapted for warships. A method of automatically adjusting the protective devices of D.C. rolling-mill motors according to the speed is covered by Siemens Bros. Dynamo Works. Opposition has been entered to a patent by the Westinghouse Metallfaden-Gluhlampenfabrik-Ges. for a process of decarbonising metal filaments. (Page 826.)

Melbourne City Council require a 4,000-ampere-hour battery; Copenhagen Corporation, a 4,000-kw. turbo-alternator; Sale Council, Diesel oil engines and generators; Taunton Corporation, single pole switches and fuses; Morley Corporation, tramway track; and Warrington Corporation, steel points and crossings. Extensions are contemplated at East Ham (£17,430), Hull (£100,000), Finchley (£15,500), Greenock (£32,000), and Maidstone (£4,000). Extensions are also contemplated at Huddersfield. (Page 827.)

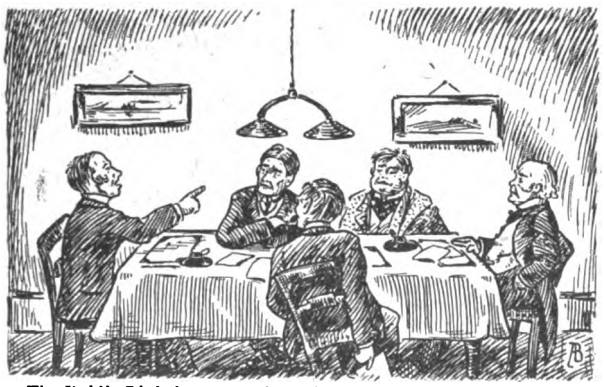
TRAIN LIGHTING

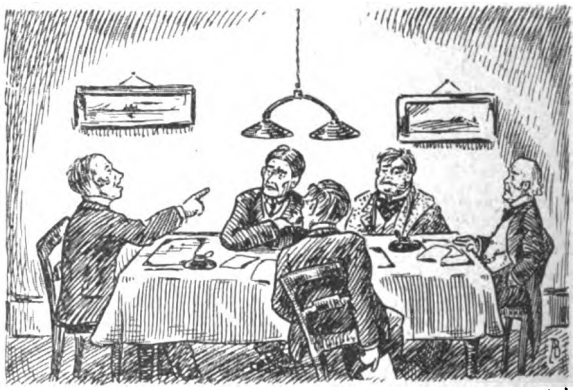
IT is a regrettable but indisputable fact that the effects of the deplorable accident which occurred on the Midland Railway on Saturday were rendered more serious than need have been the case by the presence of gas lighting on the train. The danger of gas in railway accidents has been pointed out over and over again; it seems extraordinary that some of the railway companies should show so little regard for the safety of their passengers, and we trust that the Board of Trade will now take action in the matter. The danger has been fully recognised in other countries, and already in Austria the total supersession of gas by electric lighting on trains has been decided upon, and the completion of the change is only a matter of time. In Switzerland, too, movement is being made in the same direction. There is no technical difficulty involved; many excellent systems of electric train lighting have been devised, perfected, and proved reliable in practice, and, in fact, both as regards economy and convenience, electric train lighting systems have shown themselves superior to gas. Several railway companies, both in this country and abroad, have voluntarily replaced gas by electric lighting, but the change is taking place too gradually. Even if the cumbrous machinery of a Government Department cannot be invoked, we hope that the shareholders of the railway companies will find a means of rousing the directors to a better sense of their responsibility.

The Fire at Dick, Kerr & Co.'s Works.—We understand from Messrs. Dick, Kerr & Co., Ltd., that the statement as to a fire at their works at Preston last Thursday was much exaggerated. It appears that a tank of varnish caught fire, but that only very slight damage was done.



COMPLAINTS OF GAS LIGHTING IN REGENT STREET

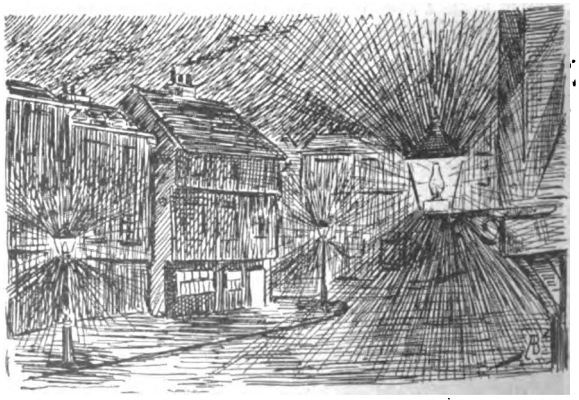
AT the Westminster City Council on Thursday it was stated that the leading tradesmen in Regent Street are of the opinion that the new system of gas lighting introduced by the Westminster City Council is not so good as when the thoroughfare was lighted by electricity. The point arose out of a report by the Works Committee to rescind a previous resolution of the Council that an offer by the St. James's & Pall Mall Electric Light Co., Ltd., to provide and maintain for five years at their own expense additional public lighting in Piccadilly Circus by means of electric flame arc lamps be accepted. The St. James's Co. proposed to put up on three columns, 35 ft. high, *i.e.*, 15 ft. higher than the gas lamps, flame arc lamps to give an aggregate lighting power of 36,000 c.p. in three clusters, each giving 12,000 c.p.



To this proposal the Gas Light & Coke Co. object, as violating their contract with the City Council, Clause 10 of which states that any additional lighting, if found necessary, is to be provided by the contractors, *i.e.*, the Gas Co., as the Council retain the power "to increase the number of lamps as and when they may deem desirable, such additional lamps being provided and maintained at the prices in the accepted tender." The St. James's & Pall Mall Co. communicated with the Council to the effect that, should the decision to allow them to erect these lamps be rescinded, their only alternative would be to retire altogether from a competition in which, apparently, they cannot expect to receive fair play.

In recommending the Council to rescind the original resolution giving consent to this electric lighting, the Works Committee state that they are now of the opinion that such an enormous concentration of light (whether electric or gas) would depreciate the effect of the new gas lighting, and would, from the point of view of public lighting, be superfluous. The recommendation not to allow the St. James's Co. to carry out the experiment was passed by the Council.

At Leith, the Electricity Committee have reduced their price both for power and lighting; the Tramways Committee claim that the reduction should apply also to Tramways; but the Electricity Committee contend that the reduction refers only to consumers amongst the general public. According to the *Edinburgh Evening Dispatch*, both Committees are composed of the same members. The following is what may be expected to occur on similar lines in the Urban District of Muddlett:—



The Public Lighting Committee decide to invite tenders from both the Gas and Electricity Committees for the lighting of the streets of Muddlett. The Chairman explains that in the case of Westminster (London) such competition resulted in obtaining an exceedingly advantageous contract.

The Gas Committee, who have been informed of recent events in Westminster (London), decide that, in view of the increasing headway made by the rival method of illumination and the consequent loss of business to the gas undertaking, they will tender below cost price.

The Electricity Committee decide that, profiting by the experience gained in Westminster (London), it will be necessary to quote considerably under cost price to secure the contract.

The Local Government Board refuse to sanction the loan.

ELECTRICAL EQUIPMENT OF THE WORKS OF MESSRS. J. B. BROOKS & CO.

THE electrical equipment of the above works is of interest as illustrating how under efficient and progressive management it becomes a practical necessity to adopt electric driving. Until a few years ago the works were dependent on gas engines for their supply of power, but it was

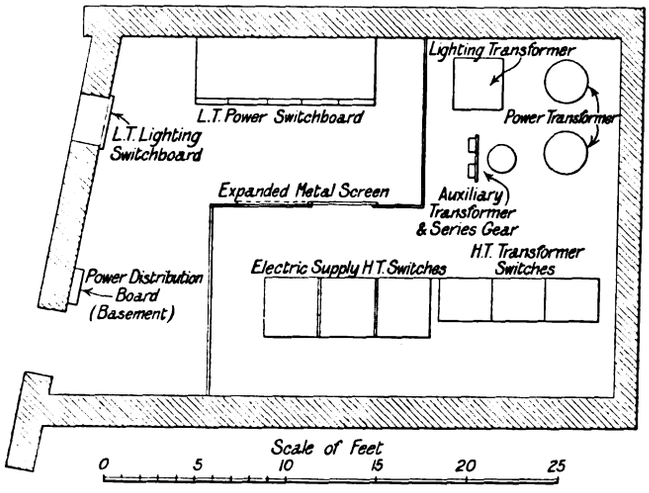

FIG. 1.—PLAN OF SUB-STATION.

then decided to install a few electric motors as an experiment. These motors gave so much satisfaction that the firm determined to adopt electric driving throughout, and at the present time there is not a single gas engine remaining.

The works buildings, although compact as regards ground plan, consist in most parts of four floors, so it will be readily understood that there were considerable losses in belting and shafting with the old method of driving by engines placed in the basement. For example, if it was desired to use power in the top floor only, it was nevertheless necessary to drive all the intermediate belts, pulleys, and shafting.

Messrs. Brooks & Co. take their supply of power from the electric supply department of the Birmingham City Council, this supply being given in the form of three-phase current at a pressure of 5,000 volts, and a periodicity of 25 cycles. The high-pressure mains are brought into a sub-station which is situated in the centre of the Livery Street portion

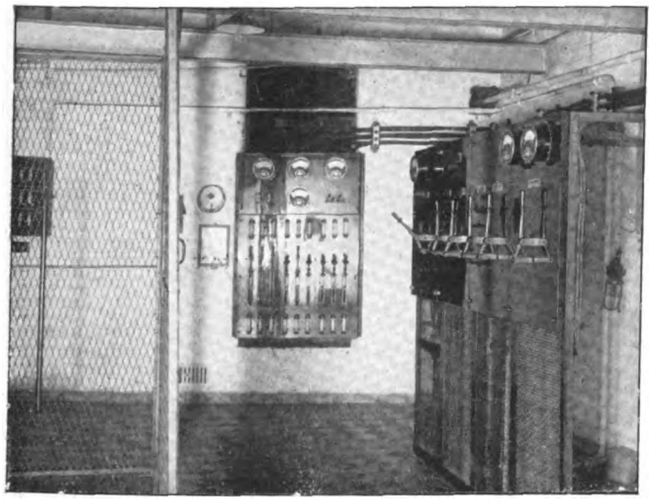

FIG. 2.—SUB-STATION, SHOWING POWER AND LIGHTING SWITCHBOARD.

of the works, and of which a plan is given in Fig. 1. The H.T. supply is given on the ring-main principle, and the electrical department have installed three switch panels, two of which serve to cut off either side and the third to cut off the supply to the consumer. All these panels are of the standard type used by the department, and consist of oil-break three-pole switch fitted with overload trip, isolating switches, and charge indicators, the whole being enclosed in sheet-iron case. On the consumer's panel, in addition to the above, an integrating wattmeter and an ammeter are fixed. From the oil switch on the consumer's panel the high-tension mains are taken to three H.T. transformer panels, which control the primary circuits of the three-power and lighting transformers. There are two three-phase, 50 k.v.a. power transformers, which reduce the pressure from 5,000 to 440 volts and one three-phase, 100 k.v.a. lighting transformer, the secondary pressure of which is 115 volts. All these transformers were supplied by the British Electric Transformer Co., and are of the oil-immersed type. The secondaries of the power transformers are controlled by two switch panels which form a part of the L.T. power switchboard, and the secondary of the lighting transformer is controlled by the L.T. lighting switchboard. Figs. 2 and 3 show views of the sub-station and its switchgear.

As during a considerable part of the day only a comparatively small number of lights are in use, it was decided recently, on the advice of the consulting engineers, to use a series transformer on the "Berry" system so as to reduce the light load losses of the main lighting transformer. Accordingly, a 10 k.v.a. auxiliary transformer was installed, together with the necessary automatic switchgear for short-

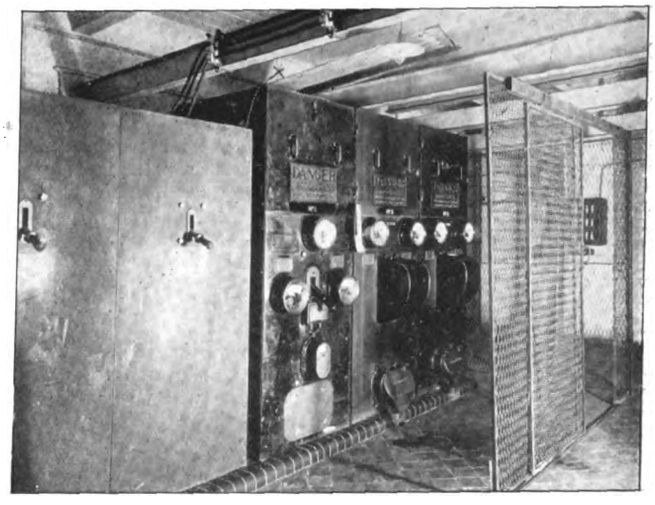

FIG. 3.—SUB-STATION, SHOWING H.T. SWITCHGEAR.

circuiting it when the load is more than it is capable of dealing with, and this arrangement has effected a considerable economy, since the constant iron losses are reduced by approximately 80 per cent.

The system of wiring adopted in the case of the motors is galvanised steel conduit with V.I.R. cables. The sub-mains in the Livery Street portion of the works are controlled by switches and fuses on the L.T. switchboard in the sub-station and terminate in three-pole fuse-boards in cast-iron cases, one of which is situated on each floor to control the motors on that floor. In the case of the Great Charles Street portion of the works, a three-core paper-insulated and lead-covered cable is taken through the tunnel which connects the two parts of the works; this cable is controlled by one switch panel on the L.T. switchboard in the sub-station, and terminates in a four-way distribution board situated in the basement of the Great Charles Street works. From this distribution board sub-mains are carried in galvanised steel conduit to four three-pole fuse-boards situated on the various floors, as in the case of the other portion of the works. The wiring work was carried out by Messrs. Ellis & Ward, of Birmingham.

There are in the various parts of the works twenty-seven motors, varying in size from ½ h.p. up to 20 h.p. These are all of the squirrel-cage type, and are for the most part of the British Westinghouse Co.'s manufacture.

The majority of the starters are of the rheostatic type, made by George Ellison (Birmingham), but a few motors

Digitized by Google

are provided with star-delta starters. The former starters are provided with both no-voltage and overload releases, the latter having a time lag attached to prevent their operation when the power required exceeds the normal for only a few seconds. Most of the motors are fixed on brackets attached to the walls and drive shafting by means of belting, but a few are fixed to the floor.

One of the chief products of this firm is, of course, the well-known Brooks cycle saddle. It is probably not so well

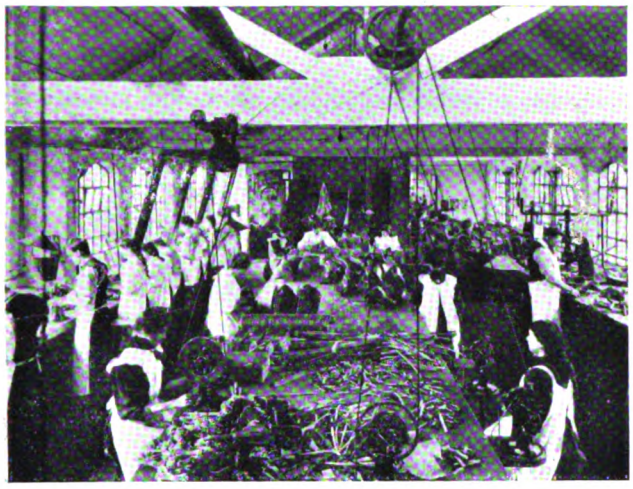

Fig. 4.—Leather-working Shop.

known to the general public that Messrs. Brooks are also manufacturers of a variety of other leather goods, such as dressing-cases, footballs, leggings, purses, &c.

The machines required for the manufacture of a Brooks cycle saddle are varied, and include special machines for straightening and bending wire, mops for polishing, automatic machines for turning out the screws and nuts in large numbers, shaking barrels for cleaning metal parts, presses for cutting out both metal and leather portions of the saddle, sewing machines, and veining machines for straps, &c. A view of the leather-working shop is given in Fig. 4, and a motor generator set consisting of a three-phase motor driving two plating dynamos is shown in Fig. 5.

Three of the motors are used for operating goods lifts in different parts of the works, and as the arrangement adopted is somewhat novel a description of same will be of interest. The motor for each lift, which is of the squirrel-cage type

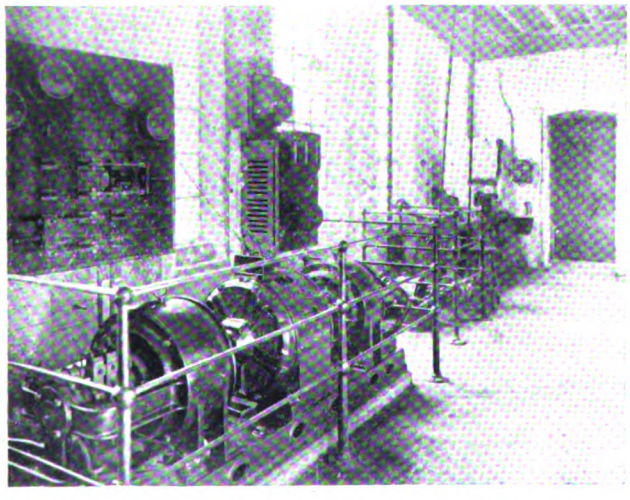

Fig. 5.—Motor Generator Set for Plating.

of 5 b.h.p., is provided with a slipping clutch, made by the Lancashire Dynamo & Motor Co., of Trafford Park, Manchester. This clutch, which acts as a flexible coupling, consists essentially of a boss having two or more radial driving arms secured to the motor shaft; at the extremity of each arm is placed a curved slipper, which is free to move radially outwards on the rotation of the motor shaft; in moving outwards the slippers impinge on the inner circumference of the other half of the clutch, which is keyed to the shaft to be driven, and which, in appearance, resembles a hollow pulley. When current is first switched on to the motor the rotor is free to revolve by itself, and until the speed has reached a considerable value the slippers do not exert sufficient pressure to grip the coupling and drive the worm shaft.

This device allows of the cage being started without shock. With this type of clutch on the motor it is possible to switch the motor direct on to the mains without any form of starting device to give reduced voltage at the motor terminals; in the lifts in use at Messrs. Brooks' works, the controller takes the form of a reversing switch, so that the electrical gear is extremely simple and the waste of energy in resistance is avoided.

The lighting of the works is carried out by means of incandescent lamps, which are for the most part of the carbon filament type. Metal filament lamps of high voltage and low power do not show to their best advantage in a building with several storeys, with much vibration, and with current at less than 1d. per unit, the higher price of lamp renewals may counteract the gain in consumption due to their higher efficiencies, although with the prices of supply for lighting more usually paid the superior economy of the metal filament lamp is unquestionable. The wiring for the lights is carried out with V.I.R. wires in wood casing and capping, and it is arranged to balance as far as possible the total number of lamps between the three phases.

It will be of interest to give some idea of the effect of the introduction of electric driving from the financial point of view. The method adopted by the firm in calculating their power costs is to compare the total expenditure on power and fuel with the total sales, and we give here the comparative figures for the years 1907 to 1910:—1907, 0·83 per cent.; 1908, 0·84 per cent.; 1909, 0·79 per cent.; and 1910, 0·74 per cent.

The first motors were installed in 1908, and the last gas engine was removed in 1910, so that there is a decrease in the comparative cost of power due to electric driving of about 12 per cent., and this notwithstanding the fact that a considerable increase has taken place in the number of machines driven by power.

Our best thanks are due to Mr. Boultbee Brooks, one of the managing directors of the company, for permission to describe the works, and to Messrs. Moffett & Rosher, the consulting engineers, who designed and carried through the electrical conversion, for furnishing the technical particulars given in this article.

THE MERZ-PRICE PROTECTIVE SYSTEM

THE Merz-Price system of protection of electrical circuits formed the subject of a Paper read last week before the Newcastle Local Section of the Institution of Electrical Engineers. One entitled "Switchgear and the Isolation of Faults on Supply Systems," by Mr. H. W. Clothier (Messrs. A. Reyrolle & Co.), on Monday, December 19th.

The Paper commenced with some general remarks on the necessity for instant isolation of faulty parts of a system, and the suitable interconnection of the network. Ring mains were more economical than duplicate cables, and lent themselves more easily to the isolation of portions of the circuit without interruption of supply. The general requirements of switchgear from the protective point of view were summed up, and some of the disadvantages of certain types of high-tension switchgear were pointed out. The desirability of the complete enclosure of live conductors, in preference to bare conductors in cells, was emphasised, however elaborate the interlocking between the doors, isolating switches, &c.

Turning to the actual protective gear, he said that the discriminating devices which had been most generally used were overload devices and reverse-current devices (with or without time-element), but, in his opinion, the system of balance gear which he was about to describe was the most satisfactory and reliable. The use of graded time-limits in series had not been altogether a success, and the arrangement could not be used on a ring main; it was opposed to the principle of instantaneous release, and it was difficult to predetermine the correct setting of the relays. The principal difficulty with reverse-current devices was to make them inoperative when faults occurred on sections other than those which they were intended to protect.

In the system of balance protection the criterion of operation is that, while a section is sound, the current entering it must be identical with that leaving it (excluding a very small amount due to capacity). Current transformers are installed at the entries and exits of each section, and a balance of their electrical properties is obtained. In the

Digitized by Google

event of a fault or leakage occurring, the current leaving a section differs from that entering; the balance is hereby disturbed, and by means of relays the circuit-breakers are automatically opened at the ends of the faulty section. Three methods of connecting this system have been adopted—E.M.F. balance, current balance, and neutral wire balance. The connections of the first are as shown on Fig. 1. The balance is obtained by having the E.M.F. at the secondary terminals of the current transformers in opposition, that is to say, under normal conditions no current flows through the pilot wire. The connections for "current balancing"

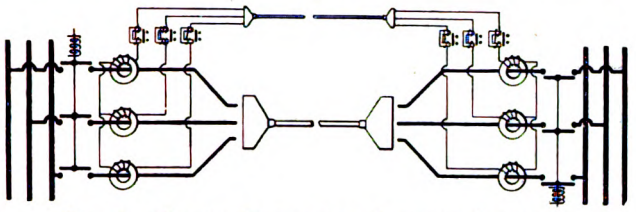

Fig. 1.—Feeder Protection, Current Balance.

are as shown on Figs. 2, 3, and 4. The secondaries of the transformers are connected uni-directionally, *i.e.*, under normal conditions current flows through the pilot system in direct proportion to the main current. There were two systems developed under this category—the first was that shown on Fig. 4, which has been called "magnetic balance," and the other, that on Figs. 2 and 3, the "bridge" method.

In the third system, called "Neutral Wire Balancing," an example of which is shown on Fig. 5, the secondaries of the transformers are connected uni-directionally as for current balance, the neutral wire connects between points of equal

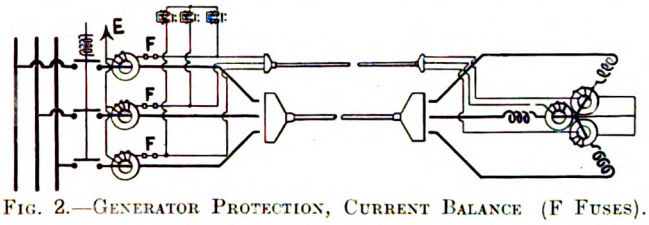

Fig. 2.—Generator Protection, Current Balance (F Fuses).

potential at the two ends of the section, and in this case under normal conditions, no current passes through the pilot system on which the relays are connected.

In some cases it is desirable to supplement the balance gear with devices for protection against sustained overloads. With current balancing this can be obtained by merely inserting fuses in the secondary protective leads, as shown in Figs. 3 and 4. The introduction of a time-limit device applied to feeder protection with E.M.F. balancing has also been suggested.

The above diagrams indicate in each instance the connec-

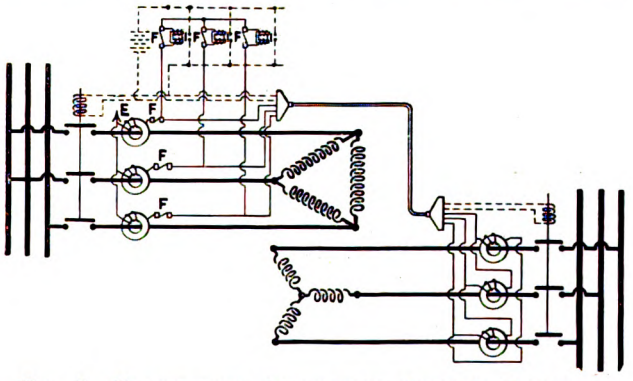

Fig. 3.—Transformer Protection, Current Balance.

tions for three-phase A.C. systems having the neutral point earthed, which, considered from a protection point of view, is the most suitable system in that a fault of sufficient magnitude between either of the three phases and earth would operate the relays. On the other hand, in a system with insulated neutral, a smaller number of transformers, relays, and pilot wires can be used.

A method of balance protection by three-core feeder-cables, known as "core balance," or leakage protection, has also been devised, in which the three cores pass through one current transformer, which only has current induced in its secondary when the algebraic sum of the currents in the three cores is other than zero. In another modification of this system, three transformers are used, one on each phase, and fuses and further relays are introduced to give a time-element overload protection. The use of this system is of course strictly limited as a means of protection against faults on high-tension networks by the fact that it only discriminates between a fault to earth and an overload, that is, it is quite useless in its present form for ring main protection. It may, however, serve some purpose in the protection of tail ends and for mines and places where sustained arcing is a great source of danger.

The Paper then dealt successively with generator, bus-bar feeder, and transformer protection. Generators can, if desired, be protected from failing field by a relay and time-element, which will open the main switch when a drop in

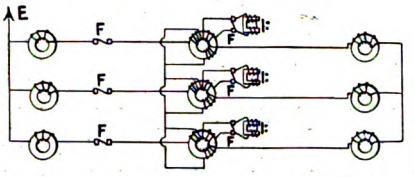

Fig. 4.—Transformer Protection with Relay Balance Transformers, Magnetic Balance (showing Secondary Connections only for simplicity).

excitation voltage occurs, and a reverse power relay may be resorted to, protected against failure of the prime mover, but in many stations this is not considered necessary. Protection against breakdown of the machine itself is best effected by the current balance method shown in Fig. 2. Bus-bars can be protected by placing current transformers on each entry to and exit from the switchboard, or any section of the same. These transformers are so connected that a balance in the secondary circuit is maintained under healthy conditions, but immediately a short or an earth occurs on any conductor on the switchboard all the switches connected to the faulty section would be opened, thus isolating the bus-bars and all the electrical connections attached to them.

For feeder protection, the simplest arrangement is the E.M.F. balance method of Fig. 1. The adoption of the balance protection on a large system carries with it the

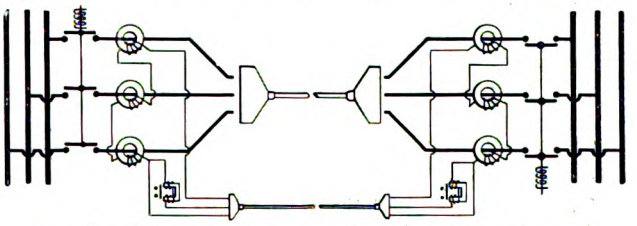

Fig. 5.—Feeder Protection, Neutral Wire Method.

necessity for sectionalising the various ring mains and interconnected network by means of overload cut-outs at certain points: for instance, in the absence of some form of protection to isolate a sub-station switchgear automatically in the event of a short circuit occurring on its bus-bars, a heavy current would be fed into the fault. In order to guard against the possibility of a shut-down under such fault conditions the network is divided into areas which are interconnected by cables equipped with an instantaneous overload release, and time-element overload devices are installed at the generating station end or at other sources of supply to the several areas. For transformer protection, the current balance method already described is most suitable.

The Paper concludes with a description of the now well-known system of ironclad switchgear developed by Messrs. Reyrolle & Co., which, in conjunction with the Merz-Price system of protection, has given excellent results on the power distribution systems in Northumberland and Durham.

Discussion.

Mr. E. B. Wedmore (British Thomson-Houston Co.), who opened the discussion, thought that a difference should be made between generating station and sub-station switchboards. The latter were to some extent protected by the power-house board, which should clear a fault in the section in which the sub-station was. For sub-station boards, however, a more compact design was justified than for a generating station. Referring to the type of iron-clad switchgear described, he criticised the filling in of

Digitized by Google

the space around the bars by compound, and considered that, even for enclosed conductors, an air space was preferable. He also considered that the close sealing up of the apparatus would increase the explosive effect in the event of trouble.

With regard to protective gear he agreed with the principle underlying the same, the difficulty having always been the standard by which it should be determined whether current had reversed or not. In the old days the standard of reference was always the potential of the supply, and he believed that he was the first to construct a relay in which current was compared with current and not potential. At the same time Messrs. Merz and Price developed the apparatus described to-night, also employing a comparison of current against current. There was no other system so reliable for single interconnectors and single ring mains, and cases where the cost of pilot wires was not of importance. There were, however, other systems which could meet the conditions without pilots in many cases, and he described a simpler arrangement adapted to duplicate mains carrying the same current.

Mr. WOOD then asked a few questions.

Mr. HUNTER expressed the opinion that the iron-clad gear removed dangers which had been experienced, due to the effect on neighbouring conductors, of smoke and flame ejected from oil switches on bad short circuits. With regard to the balanced protective gear, it was admittedly faulty, but one could not get a better. It saved 30 to 40 per cent. of capital expenditure on mains compared with other systems.

Mr. W. C. MOUNTAIN (Messrs. Ernest Scott & Mountain) thought that the Merz-Price system had the objection in colliery work that it had a fourth wire, and if the system that Mr. Wedmore had hinted at could be used with the same simplicity, he would rather favour it. Protective systems were very useful if not overdone; but one did not want the whole apparatus to be safeguarded to such an extent that if one touched anything the whole system went down. For example, in the case of a pump in-bye, it was sometimes necessary to keep it running even if faulty, provided it was watched carefully.

Dr. W. M. THORNTON (Armstrong College, Newcastle) made some remarks on the nature of the break in oil switches and the quality of oil most suitable.

Mr. C. S. VESEY BROWN expressed admiration for the enclosed gear in preference to open bus-bars.

Mr. ANDERSON spoke from experience of the reliability of iron-clad gear. On large systems, when a short-circuit occurred near a power station, the effect was like an explosion. Once when an open isolating switch blew out, the explosion moved concrete blocks three feet square and 3 in. thick, and blew out windows in the power-house. He thought that a strong iron-clad board would localise damage, as the arc would go to earth through a smaller space. He asked what were the limits to which one could go to a short circuit before the transformers went out of balance.

Mr. F. O. HUNT drew attention to the similarity between the system described by Mr. Clothier as "core balancing," and that which had been developed and worked by Mr. M. B. Field. In this a balance was obtained of the magnetic effect of the three cores of a three-phase cable, and therefore the same sort of protection. With regard to oil switches, it was important to remember that an automatic switch took appreciable time to operate, however complete the short-circuit might be, apart from the speed of the relay. In a mine such delay might be sufficient to start a fire.

Mr. VERNIER spoke of the application of protective gear to overhead transmission lines. With the Merz-Price gear the falling of a wire causes instant isolation if it strikes an earthed bracket or guard wire. It would be an advantage if operation could be ensured directly a wire broke. This could be done by a coil on a pilot wire connecting the neutral points of the transformers in star at each end. With Merz-Price gear one knew where to look for the fault, and the faulty feeder did not interfere with the supply to consumers.

Mr. PORTER pointed out that any capacity current in the cable passed through the relay, and might be sufficient to trip it. The difference between the minimum fault current and the maximum capacity current was the margin on which the relay had to work. It was difficult to get gear working on the required margin with capacity on a long pilot. The current transformers are often so designed that the characteristic fell away considerably, and induction coils should shunt the pilot in order to balance its capacity. For section faults and bus-bar faults, such as switches sticking, with extensive sections there was not a time-limit overload relay in existence to meet the conditions. For generator protection, as the ordinary winding of a generator is such that the fault is nearly always a fault to earth, a useful arrangement would be to arrange a current transformer on each phase of the generator and one on the earthed neutral connection in conjunction with a relay, so that out-of-balance due to an earth fault would trip out the generator.

Mr. CLOTHIER, in his reply, said that he would rather stand near a conductor in compound than one in an iron chamber when trouble was in progress, as the sudden expansion of air might easily shatter a cast-iron case. The chief difficulty relating to a conductor in compound was to get it out again. The cell type gear was in use in the majority of big generating stations, but he thought that the day when it would not be was not very far distant. The day would also come when big generators with all their conductors would be completely enclosed in metal casing and run in solid with compound. Some rough experiments had been taken, from which it was estimated that the time taken to clear a fault was $\frac{1}{20}$ to $\frac{1}{10}$ second. This was not so quick as one would like, but proposals had been made by Mr. Taylor, of Birmingham, by which he estimated a switch could be opened in $\frac{1}{100}$th second. If such were possible it would save the hammering action which occurred at each period on the winding of a machine with a fault in it. The effect of capacity current that Mr. Porter had mentioned was not so serious as one would at first think.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ELECTRICAL PLANT, INSTRUMENTS, &c.—We have received from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), copies of the first four of a series of Bulletins which the company are issuing as supplements to their ordinary catalogues. These contain more technical particulars and explanatory matter than can be included conveniently in the catalogues themselves. The first is entitled "Important Plant," and contains many excellent illustrations of large and small machines which the company have made at their Witton Works, including numerous large turbo-generators as well as slow-speed generators. A detailed list of large installations carried out by the company is also given. While this is mainly devoted to generating plant, No. 2 of the series, entitled "Electrical Plant for Shipyards and Engineering Works," treats of electric motors and their applications. Useful information is set forth regarding systems of drive, and particulars with approximate price of the motor involved are given in the case of the numerous examples illustrated. The third Bulletin is devoted to descriptions of Dr. W. E. Sumpner's iron-cored moving-coil wattmeters and other instruments, and their applications, and the last is the Bulletin on "Country House Lighting," which has already been reviewed in these columns.

MEASURING INSTRUMENTS.—A handsome new list from the Electrical Co., Ltd. (122–124 Charing Cross Road, W.C.) illustrates and describes a complete range of switchboard, portable and testing ammeters, voltmeters, and wattmeters, including numerous patterns of the electromagnetic, moving coil, induction, hot wire, and dynamometer types. Particulars of current and potential transformers are also included, but no prices are given.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

HEATING APPARATUS.—We have received from the Bastian Electric Heating Syndicate, Ltd. (91 to 93 Palmerston House, E.C.), a new catalogue of their well-known "Quartzlite" heating and cooking apparatus, in which the metal heating units are enclosed in quartz tubes and the whole allowed to glow at a dull red heat. The articles to which this system is applied include radiators, ovens, hot-plates, toasters, coffee percolators, kettles, boilers, etc., with complete removable heating elements applicable to various different utensils, water boilers and irons.

TELEPHONES.—A new list from the Sterling Telephone and Electric Co., Ltd. (200 Upper Thames Street, E.C.), describes the Sterling "Primax" system of automatic central battery intercommunication telephones, in which special means are adopted to avoid induced cross-talk between the lines. Several patterns of instrument are made, and the list contains particulars of special batteries and multiple cables recommended for use with the system.

CALENDARS, &c.—This season's wall calendar from the D.P. Battery Co., Ltd., Bakewell, Derbyshire, well keeps up the reputation of its artistic predecessors, and bears a coloured view of Lathkill Vale, near the company's works.

A small monthly tear-off calendar from the Electric Supply Publicity Committee is embellished with one of their well-known advertisement designs.

A waistcoat pocket diary of very convenient size and shape is being issued to their friends by the Brush Electrical Engineering Co., Ltd.

Institution of Post Office Engineers.—A meeting of this Institution will be held at the Institution of Electrical Engineers on Monday, January 16th, at 6 p.m., and members of the latter Institution are invited to attend.

Electric Traction in Germany.—It is reported that Herr von Dernburg, the ex-Colonial Secretary of the German Government, has accepted a seat on the board of the Allgemeine Elektricitats-Ges., and may later become president on the retirement of Dr. Emil Rathenau. Herr Dernburg will then, it is said, make renewed efforts in connection with the substitution of electric for steam traction on all the State railways.

ELECTRIC TRACTION IN AUSTRIA-HUNGARY

AMONG the Papers presented before the International Railway Congress in Bern this year was one on the subject of electric traction in Austria-Hungary, by Dr. A. Hruschka, head of the department of the Austrian State Railways, which is preparing plans for the conversion of the Austrian railways to electric traction.

At present there are only seventeen light railways operated electrically, excluding tramways, and of these only two are on the single-phase system with pressures of 2,500 volts and 550 volts respectively, the other fifteen being continuous-current railways. Two other light railways, aggregating about 100 miles of line, are under construction by the Austrian and Hungarian houses of Siemens-Schuckert-Werke respectively. The first of these is the line connecting St. Pölten, Mariazell, and Gusswerk, which is the first narrow-gauge line to be equipped on the single-phase system. The total length of the line is about 57 miles. A trolley-wire pressure of 6,000 volts and a frequency of 25 cycles are to be employed. The trains are to be hauled by locomotives, fourteen of which of the design illustrated and described in ELECTRICAL ENGINEERING, Sept. 29, 1910, p. 625, have been ordered. Power will be supplied from two water-power stations and a Diesel gas-engine reserve station at St. Pölten, the current from which will be transmitted at 25,000 volts to sub-stations along the line. The other line is that connecting Budapest, Vacz, and Gödöllo. This is a single-phase line operating with a trolley-wire pressure of 10,000 volts and a frequency of 15 cycles. The rolling stock will consist of four locomotives and eleven motor coaches. Power will be supplied from a steam generating station in the neighbourhood of Budapest.

Many new lines are proposed, and it has already been decided to convert certain main line sections of the State railways. One of the first sections to be converted will be the 10-mile length of main line between Trieste and Opcina, which has many badly ventilated tunnels. The traffic is very dense, and electric working is to be substituted for steam in order to increase the capacity of the line. Single-phase locomotives are to be employed, and designs have already been prepared. Other sections requiring conversion to increase their capacity are three very short lines connecting the chief station of Prague with the outlying districts. From economical reasons the early conversion of the Innsbruck-Lindau section of the Arlberg railway may be expected; the water power of the rivers Petz and Inn will be utilised for this purpose. In all, the conversion of some 612 miles of railway is under consideration (see also ELECTRICAL ENGINEERING, Vol. V., p. 724). In Hungary, the authorities have decided to equip the Fiume-Kameral-Moravieza section of the Budapest-Fiume line for electric traction, and power will be taken from a large water-power company. Further, a light railway is being constructed by Messrs. Ganz & Co. between Pressburg and the Austrian frontier. In concluding his Paper, Dr. Hruschka mentions that in all probability the main line sections will be equipped uniformly on the single-phase system, with a trolley-wire pressure of 10,000 volts and a frequency of 15 or 16 cycles.

LOCAL NOTES

Barnard Castle: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Electric Lighting Provisional Order granted to the Council in 1900.

Bingley (Yorks): *Electricity Supply.*—The Council's application to the Board of Trade to cancel the powers of the Yorkshire Electric Power Co. in this district has been refused.

Bognor: *Electric Lighting.*—Both the Council and the Chichester Electric Light Company have given notices of application for electric lighting orders for Bognor. There was a possibility of the Council agreeing to the company's application, withdrawing their own, but after a discussion in the Council it has been decided to oppose the company.

Carlisle: *Electric Supply.*—The Corporation is to apply for an Electric Lighting Provisional Order to supply electrical energy in the rural district within a radius of two miles from the Cathedral.

Dorchester: *Electric Lighting.*—Messrs. J. & W. Purves, of Exeter, propose to prepare an electric lighting scheme. A few years ago there was a Dorchester Electric Light & Power Company, but the provisional order which they possessed was never put into force.

Eastwood (Notts): *Electric Lighting.*—The local Council have on several occasions approached the Nottingham Corporation to give a supply of electricity in the district, but this has not been done, and the Council now propose to apply for an electric lighting provisional order.

Frome: *Electric Lighting Undertaking.*—The Board of Trade have raised certain objections to the proposed transfer of the Council's electric lighting undertaking to Messrs. Edmundson's Electricity Corporation.

Glasgow: *Telephone Arrangements.*—The transfer of the National Telephone Co.'s system to the Post Office at the end of next year will involve the closing down of a number of National exchanges where these exist almost side by side with Post Office exchanges. The work of preparing the arrangements for transferring the circuits from one exchange to the other has been going on for some time, and, of course, it will necessitate the alteration of some telephone numbers. An important effect of the transfer in Glasgow will be that there will be complete intercommunication between all subscribers.

Launceston: *Electric Lighting.*—The Council are recommended to enter into an agreement with the New Development Co. with regard to electric lighting.

Leith: *Charge for Tramway Energy.*—If the facts given by the *Edinburgh Evening Despatch* are correct, a somewhat amusing position has arisen at Leith with regard to the supply of electrical energy for tramway purposes. According to our contemporary, there are separate Electricity and Tramways Committees composed of the same members. Recently the Electricity Committee decided to reduce the charge for power and lighting, and the Tramways Committee considered that tramway supply came under the head of power supply, and asked for the same reduction. To this the Electricity Committee object, and the position is that the Electricity Committee are objecting to a proposal made by themselves sitting as the Tramways Committee.

London: *Stepney: Electric Supply Agreement.*—A fresh agreement has been entered into between the Stepney and Poplar Borough Councils with regard to standby supply, the agreement being terminable at any time on twelve months' notice from either party. The Board of Trade and the London County Council have to sanction the agreement.

County Council Coal Contracts.—The recommendation of the Highways Committee that the Council should deal direct with colliery owners in ordering their supplies of coal has been referred back to the committee.

Islington: Hiring of Electrical Apparatus.—The Electricity Committee have prepared a scheme for the electric lighting of private premises on the contract system, and also for the hiring out of motors, radiators, irons, fans, &c. It will be remembered that all the London Borough Councils have authority to do this work under the L.C.C. General Powers Act of 1906.

Longwood (Yorks): *Electric Lighting.*—Public meetings are being held in favour of public lighting. Mr. A. B. Mountain, Electrical Engineer to the Huddersfield Corporation, has given some information showing that domestic lighting installations can be fitted for 8s. per house, including a slot meter. Experiments in a small property in Huddersfield have shown the cost of lighting to be 18s. a year, including meter rent.

Malden and Coombe: *Electric Lighting Order Revoked.*—The Malden and Coombe Electric Lighting Order, granted in 1907, has been revoked by the Board of Trade.

Mansfield: *Tramway Extension.*—The Mansfield & District Tramways Co. have notified the Corporation that the construction of the tramway to Crown Farm Colliery will be commenced in January.

Norwich: *Tramway Purchase.*—At the last meeting of the Council the Law and Parliamentary Committee drew attention to the fact that the undertaking of the Norwich Electric Tramways Co. may be purchased as from August 6th, 1911, but made no recommendation as to any action. After some discussion the report was entered upon the minutes as "received."

Nottingham: *New Tramways.*—The Carlton Road tramways, in the East Nottingham district, have been opened for traffic. An agitation for tramways in this part of Nottingham has been carried on for many years, but it was necessary to make a new main road before constructing the lines.

Potteries: *Tramways.*—The Board of Trade have granted a further extension of time for the construction of the light electric railway from Cradley Heath to Brierley Hill. Messrs. Hawtayne & Zeden are connected with the matter.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published December 22nd, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

28,577/09. **Utilising Radiant Heat from the Sun.** R. A. Fessenden (Brant Rock, U.S.A.). This patent relates to the scheme described in Mr. Fessenden's Paper before the British Association last September (see Electrical Engineering, Sept. 22nd, 1910, p. 606), and describes an evaporating tank containing water or other liquid in which is dissolved iron salts to cause it to absorb the sun's rays. A cover of glass containing an iron salt is used in order that the heat of the liquid shall not be radiated off. The steam or vapour generated is supplied to a low-pressure turbine. A combination of two tanks at different levels with pumps and turbines is also described. One figure.

29,250/09. **Propulsion of Ships.** British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*). A system particularly adapted to warships is described. Two propellor shafts are employed, one on either side of a central water-tight bulkhead, the engine space being likewise divided. Control of the machinery can be effected from either engine room. Each of the two turbines drives an alternator which supplies two induction motors on the propellor shaft, one of which is provided with pole-changing arrangements to give a low speed. Rotor resistance control is provided for one of each pair of motors. Two figures.

536/10. **Lead Joints.** Metal Jointing Co., Ltd., and T. Harden. This patent covers the use of a combined flux and jointing material in the form of a strip or ribbon which is wrapped round the inner pipe or cable sheath, so that the application of heat to the outer pipe or sheath will fuse the ribbon and complete the joint. (See Electrical Engineering, Feb. 24th, 1910, p. 140.) Four figures.

1,716/10. **Driving of Rolling Mills.** Siemens Bros. Dynamo Works, Ltd. (*Siemens-Schuckertwerke Ges.*). A D.C. rolling-mill motor, the protective gear of which is adjusted for the high rolling speeds of the later stages, cannot take as much current as it might do without sparking at the lower speeds of the earlier stages. The gear described in this specification automatically adjusts the protective devices so that the permissible current varies inversely as the speed, and thus allows heavy currents to be taken at low speeds while limiting the current at high speeds. Ten figures.

4,814/10. **Motor Starter.** Adams Manufacturing Co., Ltd. (*Cutler Hammer Manufacturing Co., U.S.A.*). A combined starter and controller has two switch arms for the armature and shunt field contact-stops respectively. An auxiliary switch, normally short-circuiting the field resistance, is opened by the movement of the armature resistance arm on to the last stop, and the field regulating arm can then be moved back, independently of the armature arm, to insert resistance in the field. Three figures.

5,660/10. **Arc Lamp.** H. Malachowski (Berlin). An arc lamp without any mechanism, with the carbons side by side as in the Jablochkoff candle, has an insulating layer of gypsum, graphite, or carbon, and a metal powder. The carbon prevents the oxidation of the metal and ensures a metallic bridge for re-ignition. Nineteen figures.

7,048/10. **Magnetic Track Brake.** J. P. Todd (Stretford). In magnetic brakes comprising a pair of side plates with wound cores between them, each exciting coil is enclosed in a spun metal case, and the connecting wires are led through stuffing boxes and glands in a second metal casing brazed or riveted to the coil casings. Three figures.

12,903/10. **Wiring Conduit Fittings.** C. E. Gunner (Anerley). To avoid the loss of the screws of the lids of conduit fittings, the screws are threaded for a short portion at the bottom only, the rest up to the head being plain and of the inside diameter of the thread. The hole in the lid is threaded, and so the screws, though loose in the lid, can only be screwed out. Seven figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Lake (*Clark*), 10,943/10 and 10,955/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Metal Jointing Co. & Harden [Lead joints] 534/10.

Dynamos, Motors, and Transformers: Felten & Guilleaume-Lahmeyerwerke A.-G. [Prevention of induced currents in shafts and bearings] 7,463/10; Biber [Repulsion motors] 15,014/10.

Electric Ignition: Brazier and Watson [Control of gas lamps] 30,383/09; R. Bosch [Construction of coils] 25,008/10.

Electrometallurgy and Electrochemistry: Henri, Helbronner and Von Recklinghausen [Sterilisation of liquids by ultra-violet rays] 28,067/09; Köhler [Electrodes for electrolytic refining of metals] 2,364/10; Werth [Tube galvanising apparatus] 9,522/10.

Heating and Cooking: Van Loon [Liquid heaters] 28,634/09.

Incandescent Lamps: Bergmann Elektricitäts-Werke A.-G. [Manufacture of metal filament lamps] 21,326/10.

Instruments and Meters: Chevretot [Temperature indicator] 15,747/10; Chamberlain & Hookham, Ltd., and Sprague [Prepayment meters] 17,415/10.

Switchgear, Fuses, and Fittings: Winn [Leakage indicators] 28,430/09; Clarke, Chapman & Co. and Harris [Control gear] 29,004/09; Schultz [Automatic circuit-breakers] 30,185/09; Lind [Electrical bulkhead fittings] 1,076/10; Boult (*Crowdus*) [Electro-magnetic devices] 13,662/10.

Telephony and Telegraphy: Elphinstone [Signalling mechanism] 1,484/10; Arnold [Signalling apparatus] 23,044/10.

Traction: Hansen [Block-signalling system] 25,129/09; Colman [Railway signalling] 3,629/10; Altoun [Ventilator for railway and tramway vehicles] 18,981/10.

Miscellaneous: Parsons [Turbines] 29,119/09; Loebl and British Ever Ready Electrical Co. [Warming of internal combustion engines] 29,238/09; Gates [Electrically illuminated signs] 29,437/09; Scott [Illuminated signs] 535/10; Le Fevre [Door alarms] 2,963/10; Keller-Dorian [Composite magnets] 16,367/10; Rice [Illuminated signs] 17,335/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Hartmann & Braun A.-G. [Mounting electrodes in vapour lamps] 26,747/10; Ges. für Maschinen- und Metall-Industrie, 27,942/10.

Distribution Systems, &c.: Speakman [Insulators for use in mines] 27,804/10.

Dynamos, &c.: Allgemeine Elektricitäts Ges., 27,993/10.

Electric Ignition: Ginestes [Sparking-plugs] 27,991/10.

Incandescent Lamps: Siemens & Halske A.-G. [Manufacture of filaments] 22,365/10; Lichtwerke Ges. [Filament supports] 27,710/10.

The following amended Specifications can now be obtained.

Johnston [Ceiling roses] 11,773/09; Schlick [Dynamo for bicycle lamp] 5,043/10.

Opposition to Grant of Patent

2,983/10. **Tungsten Filaments.** Westinghouse Metallfaden-Gluhlampenfabrik Ges. (Vienna). Opposition has been entered to the grant of this patent. The specification, abstracted in Electrical Engineering, November 3rd, 1910, p. 700, describes a process of decarbonising tungsten filaments in a vacuum furnace.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

30,144 of Dec. 31st, 1896. **Storage Battery Plates.** A. F. Cothias (Ivry, France). Lead plates for storage batteries and electrolytic apparatus are rendered porous by evaporating oil in the mould during casting.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: British Thomson-Houston Co. (*W. le P. Emmet, U.S.A.*) [Commutator bars] 16,049/00; H. Chitty [Ventilation armatures and commutators] 19,522/03.

Electrometallurgy, &c.: J. Harris [Ozonised-air ventilating system] 17,805/01.

Instruments, &c.: J. C. Fell (*W. Stanley, U.S.A.*) [Motor meters] 15,888/00; C. E. Hibberd [Prepayment meters] 17,877/05.

Switchgear, &c.: A. P. and G. C. Lundberg [Wall sockets] 19,076/98; P. H. Thomas [Connections of vapour rectifiers] 18,987/04, and [Vapour rectifier and starting switch for D.C. motor driven off A.C. supply] 18,991/04.

Traction: J. F. Mason and H. Kremnitz [Tramcar obstruction-remover] 19,431/02; R. Ames [Rail drainage inspection box] 19,806/02; J. & T. O. Dixon [Railless traction system] 19,540/04 and [Electric canal haulage] 19,541/04.

Miscellaneous: H. H. Lake (*Soc. L. Gaumont et Cie.*) [Synchronous driving of phonographs and cinematographs] 18,015/[illegible]

Digitized by Google

Scarborough: *Tramways Service.*—The Corporation have been granted a summons against the Tramways Co. for failing to provide a winter service.

Southampton: *New Tramways.*—The new tramways to Northam were opened last week.

Taunton: *Free Wiring Agreements.*—In view of the recent decision with regard to the free wiring agreements in Canterbury, the Town Clerk has been instructed to prepare a report as to the Corporation's position in relation to similar agreements entered into in Taunton a few years ago.

Walton: *Electric Supply.*—The Council have agreed to the Woking Electricity Supply Co. supplying certain premises in the Walton area.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—The Melbourne City Council recommend extensions of the generating plant at an estimated cost of £29,540. The new plant includes a 4,000 ampere-hour battery.

Brazil.—According to the *Board of Trade Journal* a concession has been granted to Gabriel da Silveira Basconcellos to erect a telephone line connecting a large number of municipal districts with the town of Campinas.

Copenhagen.—A 4,000 kw. turbo alternator with condensing plant is required by the Municipality. Particulars from the Elektrisk Station, Gothersgade No. 30, Copenhagen, and tenders by January 16th.

East Ham.—An inquiry was held last week concerning a loan of £17,430 for electrical extensions.

Finchley.—A loan of £15,500 is to be taken up for electrical extensions.

Greenock.—Extensions at an estimated cost of £22,000 are contemplated. Of this sum £18,000 are required for extensions to buildings, cables, coal-handling plant, &c.

Huddersfield.—A sub-committee has been appointed to investigate as to the prospective requirements of the electricity undertaking.

Hull.—A scheme of electrical extensions, at an estimated cost of about £100,000, is recommended by the Electricity Committee. The extensions will consist of 16 additional boilers and 8 turbo alternators with the necessary coal storage, etc. It is recommended, however, that only two boilers and two 4,000 kw. generating sets be installed at the present moment. This plant will be housed in a separate building on land adjoining the present power house in Sculcoates Lane.

Maidstone.—A Local Government Board inquiry was held last week concerning a loan of £4,000 for electrical extensions. The Maidstone Gas Co. and a number of other large ratepayers opposed. The inquiry was concluded.

Sale.—The Council invite tenders for Diesel oil engines and generators. Consulting Engineer, Mr. C. Hopkinson, 20 Princess Street, Manchester.

West Africa.—According to the *Board of Trade Journal*, tenders will be received at the Town Hall, San Thomé (Portuguese West Africa), by March 25th, 1911, for the installation of an electric supply works.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

PROVINCES.

Bolton.—New training college. Town Council.

Bo'ness (N.B.).—Nurses' Home at Cadzow Crest.

Chester.—Tenders are invited for a new Sorting Office. H.M. Office of Works, Storey's Gate, London.

Additions to Upton Pauper Lunatic Asylum.

Colne.—New church.

Cork.—New technical school buildings.

Dunfermline.—Riding school for Forfar Yeomanry.

Gravesend.—Additions to Milton Road School.

Grimsby.—School in Victoria Street.

Ilford.—Wesleyan Methodist Institution at Seven Kings.

King's Norton.—School at Woodgate. Architect, E. Harper.

Mirfield.—Elementary school. West Riding Education Committee.

Preston.—Grammar school in Moor Park Avenue. Builders, T. Croft and Sons, Ltd.

Rawtenstall.—Electric lighting of the Workhouse and new Infirmary at Higher Pike Law for Haslingden Guardians. Consulting Engineer, C. D. Copland, 16 John Dalton Street, Manchester.

Rochdale.—Nurses' home. Board of Guardians.

Southampton.—Adaptation of Hollybrook House as boys' home.

Stafford.—New school at Baddeley Green.

Stoke-on-Trent.—Proposed technical college.

Swansea.—Girls' intermediate school.

Todmorden.—Wiring and fitting of the Town Hall. Also conversion of the gas chandeliers to electric lighting in the Public Hall. Particulars from the Borough Electrical Engineer.

Torquay.—Secondary school on site of Elms.

Wakefield.—School in Lawefield Lane.

MISCELLANEOUS

Morley.—The Corporation invite tenders for the construction of 1 mile 7 furlongs of single line tramway with loops, together with the necessary overhead material. Particulars from the Town Clerk, and tenders by January 16th.

Taunton.—A supply of single pole switches and fuses for the 2,500 volt system is required. Particulars from the Borough Electrical Engineer.

Upholland (Lancs.).—The Bispham Hall Colliery Co. have asked the Council if they will take a supply of electrical energy for public and general lighting. The matter is receiving consideration.

Warrington.—The Tramways Committee require a supply of steel points and crossings. Tenders by January 10th.

TENDERS RECEIVED AND ACCEPTED

Carlisle.—The tender of the British Insulated and Helsby Cables, Ltd., has been accepted at £545 for the supply of cable to Messrs. Cowans, Sheldon and Co.'s works.

London: *Westminster.*—The tender of Messrs. Drake & Gorham, Ltd., has been accepted for substituting metal filament lamps for the present carbon filament lamps in Caxton Hall.

Mexborough.—The tenders of Messrs. Callender's Cable & Construction Co., Ltd., for cable at £105 10s., and that of the Royal Potteries Co. for cable troughs at £16 1s. for one-way, £19 8s. for two-way, and £21 14s. for three-way per thousand lengths of two feet each, have been accepted.

The following tenders have been accepted by the L.C.C. for 1911:—Carbons: The Brush Electrical Engineering Co., Ltd., Wm. Geipel & Co., Ship Carbons, Ltd. Electric fittings: The Atlas & Carbon Battery Co., Ltd., Baxter & Caunter, the British Ever-Ready Electrical Co., Ltd., British Insulated & Helsby Cables, Ltd., Dorman & Smith, Edison & Swan United Electric Light Co., Ltd., Elliott Bros., General Electric Co., Ltd., A. P. Lundberg & Sons, Wm. McGeoch & Co., Plutte, Scheele & Co., Ltd., Siemens Bros. Dynamo Works, Ltd., Sunbeam Lamp Co., Ltd., Veritys, Ltd., Wm. White & Co. Electric cables and wires: British Insulated & Helsby Cables, Ltd., Hooper's Telegraph & India Rubber Works, Ltd. Electric lamps: British Tungsten Lamp Co., Ltd., Cryselco, Ltd., Edison & Swan United Electric Light Co., Ltd., Pope's Electric Lamp Co., Ltd., Siemens Bros. Dynamo Works, Ltd.

Metropolitan Association of Tramway Managers.—Mr. A. H. Stanley, managing director of the London United Tramways, has been appointed chairman of the Metropolitan Association of Tramway Managers, and Mr. H. E. Blain, general manager of the West Ham Corporation Tramways, vice-chairman. Mr. T. B. Goodyer, general manager of the Croydon tramways, has been re-elected honorary secretary.

Railway Signals and Tramways.—In July the London, Brighton and South Coast Railway Co. complained that their signalling apparatus at Tulse Hill and other stations in the district had been affected by the working of the L.C.C. overhead trolley tramways between Loughborough Junction and Norwood. The Highways Committee did not agree with this view, and it was decided to ask Dr. Gisbert Kapp, as President of the Institution of Electrical Engineers, to arbitrate. This arbitration was held on November 10th and 24th, and the award is to the effect that the expense incurred by the company in carrying out certain protective works rendered necessary owing to the working of the tramways, and amounting to £309, should be borne by the Council. Each party bears its own costs, but the Council has to pay the costs of the award, making a total of £566.

OSRAM·LAMPS

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. Bolling & Lowe's *Review of the Metal Trades for* 1910 states that the outstanding feature has been the remarkable persistence in the demand for copper from all classes of consumers, a demand which has not only taken up all the metal coming into sight, but has actually made inroads upon the visible stocks, both in America and Europe. The establishment of a copper market in Hamburg where 10-ton contracts form the basis of dealing, is an event which may ultimately affect the volume of business transacted in London, and, in any case, it will have the result of necessitating the warehousing there of a considerable amount of metal, notably American electrolytic and Chili bars. Next year will see Russia, for the first time, an exporter of electrolytic copper, the development of properties and plant in that country having now reached a point at which an exportable surplus is available.

Messrs. George Smith and Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Friday night, was £59 to £59 5s. per ton (last week, £59 to £59 10s.).

Dissolutions of Partnerships.—F. Fozard and F. T. Hewitt, electrical agents and engineers, Chapel Street, Bradford, have dissolved partnership.

E. Strutt and S. A. Gardner, electrical and general engineers, St. Michael's Road, West Croydon, have dissolved partnership. Debts by E. Strutt.

J. A. Robinson and S. Bowman, dealers in electrical fittings, &c., 17 Houghton Road, Liverpool, have dissolved partnership.

Bankruptcies.—A second dividend of 1s. 4d. in the £ will be paid on and after to-day (December 29th) at Messrs. J. Miles & Co., 28 King Street, Cheapside, London, in the bankruptcy of J. Cunnington and H. Allinson, trading as Laing, Wharton & Cunnington, Electrical Contractors, 7 Great Newport Street, London.

Change of Address.—Messrs. Mirrlees, Bickerton & Day and the Mirrlees Watson Co., Ltd., give notice of the removal of their London office from Gresham House, Old Broad Street, to 122 Cannon Street, London, E.C.

Liquidations.—A meeting of Telegraph & Telephone Instruments, Ltd., will be held at 25 Victoria Street, London on January 25th, to hear the liquidator's account of the winding-up.

APPOINTMENTS AND PERSONAL NOTES

A meter-tester is required by a large electricity supply undertaking. (See an advertisement on another page.)

The Melbourne City Council have decided to send their electrical engineer, Mr. H. R. Harper, to Europe and America to investigate the latest developments in electrical engineering. Mr. Harper will leave about the middle of February, and will be absent for seven months, £500 having been granted him for expenses.

Damages for Injury caused by Feeder Pillar Explosion.—On December 15th, in the King's Bench Division of the High Court, the case came before Mr. Justice Grantham and a special jury, in which Mrs. L. E. Elliott claimed damages from the Battersea Borough Council in respect of an accident which took place on October 29th, 1909. The lady was standing by a feeder pillar and had her hand on it when an explosion occurred in it, knocking her down, and, it is alleged, causing permanent internal injury. It appears that a fault occurred on a bitumen cable, and that the gas given off collected in the feeder pillar and was ignited by the blowing of a fuse. The fault was attributed to the piercing of a tile covering the cable, in the course of the construction of a trench for the L.C.C. trams. The Judge, in his summing up, stated that there was no negligence on the part of the Battersea Corporation Electricity Department, but that the Council was, nevertheless, liable. The jury returned a verdict for the plaintiff for £525 damages.

Telephone Wayleaves.—The following letter has been received by the Birmingham Chamber of Commerce on the question of wayleaves when the Post Office takes over the National Telephone Co.'s system :—"I am directed by the Postmaster-General to inform you that, speaking generally, any private person or subscriber on whose private property poles or other fixtures for the construction of telegraphic lines have been erected by the National Telephone Company, will be entitled, after the telephone system has been taken over by the Government, to withdraw the facilities which he has granted in accordance with any agreement he may have previously made with the company. As regards poles in hedges and banks on the road-side, the Postmaster-General has certain powers under the Telegraphic Act of 1908 which are not enjoyed by the Telephone Company, and his position with reference to the use of roads and the flying of wires over property differs from that of the company."

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

United Electric Tramways of Montevideo.—Interim dividend of 6 per cent. per annum for the half-year.

Winnipeg Electric Railway Co.—Quarterly dividend of 2½ per cent.

Canadian General Electric Co.—Quarterly dividend of 1¾ per cent.

Melbourne Electric Supply Co.—After meeting debenture interest there is a net profit of £17,369 for the year to August 31st. Interest on preference shares absorbed £3,500; depreciation and general reserve £5,000; and suspense account £1,526, carrying forward £3,352. A scheme has been prepared for dealing with the arrears of dividend on the 150,000 six per cent. cumulative preference stock. An agreement has been entered into for a tramway scheme at Geelong. Mr. J. B. Brantwaite presided at the annual meeting last week. The units sold have increased by 25 per cent., and 32½ miles of additional streets have been served with mains. There have also been important additions to the power connections, and these facts taken in conjunction with authority to supply in several flourishing suburban districts, indicate that the position of the company is extremely satisfactory. The present rate of progress in the connection of consumers is three times that of last year.

Western Telegraph Co.—Interim dividend at the rate of 6 per cent. per annum.

United River Plate Telephone Co.—Interim dividend of 3 per cent. on the ordinary shares.

Hong Kong Tramway Co.—The scheme for writing off 15s. from each £1 share was sanctioned in the Chancery Division this week.

Manilla Electric Railway & Lighting Co.—Dividend of 1 per cent. for the quarter ending December 31st.

Direct West India Cable Co.—Interim dividend at the rate of 6 per cent. per annum, free of tax, for the half-year.

Halifax & Bermudas Cable.—Interim dividend at the rate of 5 per cent. per annum for the half-year.

J. G. White & Co.—Interim dividend at the rate of 10 per cent. per annum for the half-year.

New Gutta Percha Co.—A petition for reducing the capital from £200,000 to £125,000 will be heard before Mr. Justice Swinfen Eady in the Chancery Division on January 14th.

Burma Electric Tramways & Lighting Co.—There is a profit of £4,057 for the year to July 31st. The sum of £2,500 is placed to depreciation and the balance carried forward.

Costa Rica Electric Light & Traction Co.—The net revenue for the year to June 30th amounted to £14,529, against £15,[illegible] in the previous year. The work on the new power station at El Brasil is still continuing. 600 kw. of plant is in position, the pipe line and aqueduct is nearly finished, and the transmission line with transformers, poles, and fittings has been delivered.

Liverpool Electric Cable Co.—A final dividend of 15 per cent., making 20 per cent. for the year, has been declared.

Association of Mining Electrical Engineers.—A meeting of the Cardiff Branch will be held on Saturday at the Hotel Metropole, Swansea. Mr. R. R. Smith's Paper on the repair and inspection of electrical plant underground will be further discussed, and a Paper by Mr. E. Kilburn Scott on "Electricity in New South Wales Collieries" will also be read. A meeting of the Warwickshire and South Staffordshire Branch will be held on the 31st inst. at the Imperial Hotel, Birmingham, at 5.30 p.m. A Paper by Mr. E. K. Scott on "Electricity in New South Wales Collieries" will be read and discussed.

Sub-station Fatality.—An inquest was held at Ossett on Tuesday of last week on S. Henshall, who was killed by electric shock at the Ossett sub-station of the Yorkshire Electric Power Co. on the previous Sunday. Henshall, who was employed at the sub-station, was engaged in cleaning a section of the high-tension gear which had been isolated, and, having finished it, went to a live section with a metal bar in his hand, which was used to place across the 'bus-bars to cause a short, and thus prevent accidents in the event of the bars being made live during the cleaning. It appears that he touched a live part with the bar, and received a shock at 7,000 volts, which caused instant death. Evidence was given that the deceased had been properly warned of the danger. The jury returned a verdict of accidental death, and recommended that the company should provide an instrument with an insulated handle for short-circuiting the bars during cleaning.

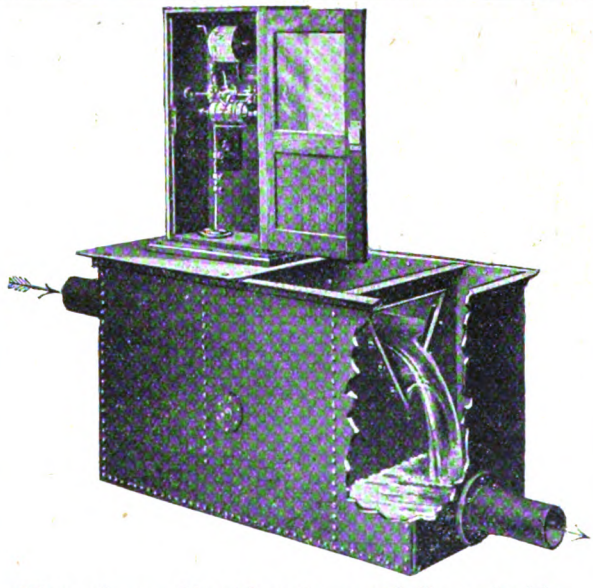
Electrically Heated Appliances
Laboratory Furnaces and Resistance Elements
to be worked under extreme conditions



Non-Corrosive—Non-Oxidizable
Specific Resistance Equal to Mercury

600 Ohms per Mil.-Ft.
Temp. Coef. .00024/°F.
Melting Point 2800° F.

Sole British Agents:-
Drennan, Glover & Cooper,
429-431 Corn Exchange Buildings, Manchester.

Makers:-
Driver-Harris Wire Co.,
Harrison, New Jersey, U.S.A.

THE
"MIDGET" TESTER

The above Machine is specially suitable for measuring small quantities of water, from 1,000 to 25,000 lbs. per hour **WITH THE GREATEST ACCURACY.**
It is Handy, Portable, and Cheap.

Full Particulars from :—
THE LEA RECORDER CO., 28, Deansgate, MANCHESTER
